Let us take the case of telecom services. Currently, local calls cost less while long distance calls cost more under a policy of cross subsidisation. This is not specific to India but is practised widely. AT & T did this in US[17] when it was a monopoly operator with the logic that a low telecom access is important in generating a higher traffic. A well-off son could call up retired parents and generate long distance traffic only if the parents had telcom access. Therfore cross subsidisation to provide cheap connectivity is not an altruistic measure to help the poor or the needy but merely a mechanism of generating more revenue. When almost all homes are covered, this method of cross subsidisation does not have much meaning and a change in tariff philosophy to reflect true cost is possible without affecting traffic volumes. However, with the extremely low telecom penetration that we have in India today, telephone access at true costs is bound to impinge upon the growth of traffic itself and possibly affect development. However, unbundling of local and trunk operations, as is being proposed under the new policy, will have to lead to a re-balancing of tariff — local tariffs will rise while long distance rates may go down. While cross subsidisation may be continued initially by giving the local operators a larger share of the long distance traffic originating within their network, there is little doubt that such subsidies will reduce over time leading to increase of local tariff. Mexico has seen a four-fold rise in the local tariff after such unbundling.[18]

The other disturbing element of the Fund-Bank policies is that one universal solution is being proposed for all infrastructural services for all countries irrespective of their stage development. Competition and privatisation for the underdeveloped countries on the pattern of UK is being advocated by the Fund-Bank agencies as a universal panacea. The advanced countries moved into selective competition in the electric supply industry and telecom after they had achieved the economies of scale and advantages of integration of their systems. It was only when the technical efficiencies of integration had been exhausted that the advanced countries looked towards competition in selected segments to improve economic performance. Here also, they have been careful to restrict duplication of resources, opening the sector out to competition either through alternative technical media or unbundling. Thus, in electricity supply, only generation has been opened for competition. In telecom, the major competitive avenue is to provide competition through either wireless or cable networks Such competition has come about when there is already a very high degree of coverage and also revenue per connection.

The underdeveloped countries are distinctly different in this regard. In India, we have yet to achieve 5 per cent of the telecom coverage achieved in advanced countries. The Indian grid is not only not integrated but even with this partial integration there is no grid discipline Without first achieving even such basic milestones, how valid is it to talk of competition? In South Korea, the private utilities had to be nationalised not due to any ideological compulsions but out of sheer inability to impose such discipline on them as required by the grid. To propose a dismantling of the state-run infrastructure at this stage of development would seem foolhardy. Yet, this is the solution that is being imposed on the state-run infrastructure sector.

Efficiency and Infrastructure

The most important reason for a lack of resistance to the dismantling of the state-run infrastructure has been the complete alienation of large state-run enterprises from the people.[19] This has led to the argument that state-run enterprises are inefficient compared to private ownership. Amongst people suffering from a completely insensitive bureaucracy, any solution that promises to get rid of the bureaucracy strikes a ready chord.

Undoubtedly, if efficiency is to be measured in terms of customer satisfaction, the state-run infrastructure services have not exactly covered themselves with glory. And if the policy of privatisation of national assets is to be reversed, measures will have to be devised which provide a better delivery of services. It may not take much time for the people to realise that a private monopoly has no reason to improve services either. This is the reason that while World Bank and other such agencies have held out UK as the model for privatisation, the British people have rejected privatisation as a solution to their problems of infrastructure. A number of sample polls have found that four-fifths to two-thirds of the people oppose the privatisation of public infrastructure in UK. However, this negative support for state-run infrastructure can turn to positive support provided infrastructure services can be made more responsive to people.

Efficiency in infrastructure has various dimensions. One can define efficiency in terms of producing the maximum physical output at lowest cost. Or one can define it as maximum output on a given capacity. One can also define it in terms of commercial efficiency — earning a maximum rate of return on investments None of these is entirely satisfactory and if used singly can be quite misleading. Unfortunately, commercial efficiency is held by the dominant orthodoxy of the World Bank variety as the only criteria for measuring efficiency, others presumably being merely derivative of this 'fundamental' efficiency.

An example will make the distinctions between various forms of efficiency clear. In the power sector, it is possible to produce power such that capacity utilisation is maximised. As we have generally a deficit in supply over demand, this is socially desirable even if it is not the most commercially sensible decision for the utilities. It is also possible to consider another measure of efficiency — producing power at minimum costs. Either way, the plants will be run most efficiently in terms of utilisation of existing resources. But in both cases they may still not be commercially efficient if the selling price is kept low. In such a scenario, producing power most economically will be less commercially efficient than producing less power at a higher cost with a high selling price. Considering that power supply is a monopoly as already discussed, commercial efficiency only means the ability to jack up prices rather than an efficient utilisation of resources. Obviously, commercial efficiency as the sole parameter produces systemic distortions without advancing either technological innovation or increased productivity.

In most countries, infrastructure services are monopolies in spite of the Bank's belief

that competition can be introduced through unbundling. The regulator sets the terms of competition and also fixes the prices. Apart from UK, the prices are generally maintained on a cost plus basis, therefore ensuring that these sectors are commercially 'efficient'. In UK, the regulator sets a five-year price cap adjusted for inflation. In order to encourage technological innovation, the price cap is not fully adjusted for inflation and the companies can keep the extra profit if they can reduce costs. The net results of the UK pricing have been huge profits that the utilities have made in the last few years, increasing greatly the popular discontent against privatisation measures.

The costs plus and sliding price caps have been the only two measures that are used to calibrate efficiency in real terms. More esoteric measures have also been worked out to identify improvements in functioning of organisations. Depending on the ideological choice of the authors, these indices can be made to speak for any set of convictions. Thus in the case of UK privatisation, British Telecom is shown to have made 'huge improvements' by these indices while British Gas and power utilities are shown to be on par with state-run services like Post and Railways.[21] A more reasoned approach may identify the cause of British Telecom's improvement to the tremendous pace of technological change in the telecom sector. This is particularly reinforced when it is realised that technological change in gas and power has been minimal. It would be interesting to compare the performance of British Telecom and government-run telecom services of other countries to see whether such improvements are due to reorganisation of British Telecom or due to more secular reasons. One would suspect that even the Indian telecom services would show similar improvements confirming that the growth of performance has been more due to technological changes rather than competition and privatisation.

The above is not to argue that efficiency is not a criterion in evaluating the performance of infrastructure but to point out the difficulty in finding one measure of efficiency. If we take the case of power, plant load factor (PLF) is assumed to be a good measure of the physical performance of the thermal power stations. However, the plant load factor depends on the load curve and, with a load factor of around 60-65 per cent, cannot be more than this in a power surplus system. Efficiency may be measured by plant availability but this ignores whether power is being produced economically or not. And for the consumer, the continuity of supply and its quality are as important as the amount being supplied. Thus in a system, the consumer may be supplied 95 per cent of his needs but face a number of interruptions. This may be considered worse than being given power equal to 90 per cent of his needs but without interruption except with advanced notice. The problem of finding a measure of efficiency is one of reducing a multi-valued parameter to one specific number. In the case of World Bank and others, it is commercial efficiency while the Indian government has tended to view the PLF as a sole criterion of efficiency. The consumers' view of efficiency is quite different and is concerned with how well his needs can be met by the system and at what costs. A solution that provides either high cost power or power cuts cannot be attractive to the consumer.

In the large-scale reorganisation that is now being introduced in the power and telecom sectors, the concern for the consumer is not even on the agenda. The electric supply industry is being restructured to make it commercially viable with guaranteed profits for the private investors. Similarly, the entire thrust in telecom is how to make private entry more attractive.[22] Obviously, the overriding consideration is one of ensuring profits, the consumer being a cipher. It is this mind-set and these interests that are setting the framework for the reforms in the infrastructure sector.

The task before us is not merely to expose the current reforms as pro-monopoly and pro-multinational as they undoubtedly are, but also project the true agenda for reforms. In such an agenda, the workers and the consumers have to come together to chart out the future. The existing rulers have surrendered their prerogative to formulate future paths, mired as they are in policies meant to bankrupt the nation. The government has started shouting from the rooftops of its inability to run the infrastructure sector. Instead of handing these services over to private and foreign capital, why does not the government agree instead that it is unfit to rule? At least history will then remember the present set of rulers more kindly than as carpetbaggers who helped dismember India.

Import Liberalisation and Development of Indian Computer Industry

Richard Heeks

The Indian computer industry has come a long way since its total reliance on imports from a few multinationals in the 1960s. However, the current round of import liberalisation is producing an increasing number of features redolent of that earlier period. This article investigates the relationship between import liberalisation and development of industrial production, exports and technological capabilities.

It concludes that import liberalism cannot be regarded as the optimum strategy for any country wishing to develop local production capabilities, and that some measure of import protection has to be in place for this development to take place. However, the case is made for a reactive government policy which can apply varying degrees of protection or liberalisation as the circumstances of external change and industrial development demand. Therefore, both the timing and phasing of policy changes will be important. Technical change and other factors are shown to have mediated some outcomes and to have constrained policy choices.

I
Introduction

THIS article considers the impact of import liberalisation on India's computer industry. This industry is chosen because of its increasing importance to the Indian economy, because of the long history of both industry and related government policies, and because of the different types of policy it has been subject to during that history.

Broadly speaking, six historical phases can be delineated.

(i) *Multinational imports (1950s-1972).* The first computer was introduced into India in 1956 for use at the Indian Statistical Institute. Multinational corporations (MNCs) were allowed virtually free rein in the Indian computer market with the result that the market was supplied with outdated equipment that was all imported. Because India had no local base of computing skills, the Indian government had little choice but to agree to this situation.

(ii) *Public sector production (1972-1978).* As familiarity with the use and maintenance of computers grew and as skills developed in complementary areas of electronics, the government felt confident to alter policy and severely restrict imports in order to encourage indigenous production. As a result, IBM decided to pull out of India. Production-related capabilities including design and manufacture were built up within the country but these remained confined to one public sector firm (Electronics Corporation of India – ECIL).

(iii) *Private sector competition (1978-1983/84).* Import protection was maintained but industrial licensing was liberalised, with several private sector firms being granted licences for the manufacture and sale of small computers. ECIL's market share fell to 10 per cent by 1980, but overall demand was boosted by an increase in government and public sector purchasing.

(iv) *Liberalising supply, boosting demand (1983/84-1987).* Slight import liberalisation in 1983 was succeeded by the true emergence of India into the computer age through three events. Firstly, the arrival in India of IBM-compatible personal computers (PCs),[1] and secondly, the arrival of Rajiv Gandhi as prime minister, with his great interest in computers. Thirdly, the 1984 New Computer Policy, which signalled a substantial liberalisation of import policy on complete computers, computer kits and components (though policy was never completely liberal).

(v) *Reversing import liberalisation (1987-1990).* Most computer industry-related policy remained stable during this period. However import policy did change because of concerns about the impact of earlier liberalisations, some backlash from local firms adversely affected by liberalisation, and changes in the political economy of the state. As a result, there was a steady reversal of some earlier import liberalisations, so that policy at the end of this period was a compromise between the relative extremes of mid-1970s protectionism and mid-1980s liberalisation.

(vi) *Renewed liberalisation (1991-1995).* Following the crisis of 1991, computer industry policy was subject to a familiar set of liberalisations: raised foreign equity limits with automatic approval; Exim scrips and easier-to-obtain advance licences followed by partial rupee flotation and then convertibility; automatic approval for many types of technology transfer; removal of licences for all new, expanding and merging units; industrial registration largely removed; locational constraints removed; new companies exempted from the requirement for steadily increasing levels of local component use (the phased manufacturing programme); reduced control of companies covered under the Monopolies and Restricted Trade Practices (MRTP) Act, increasing use of unlicensed (Open General Licence – OGL) import; and reductions in import duty, import bureaucracy and excise duty.

Nevertheless, policy was not completely liberalised. Licences were required for import of some types of computer, particularly those under Rs 0.15m (US$ 5,000), and overall import tariffs were still quite high. Government/public sector purchasing also continued to form the major part of demand, with a number of very large investments from 1993-94. Hardware exports were also promoted through the initiation of the Electronics and Hardware Technology Park (EHTP) scheme.

This article will focus on the impacts associated with policy liberalisation in the period since liberalisation of computer industry licensing in 1978. Amongst other things, it will seek to ask whether the computer industry is in danger of going 'full circle' back to the state that prevailed in the 1960s.

Section II analyses the production and export performance of this industry over the past 15 or so years. Section III looks in detail at the different types of firms operating in the Indian computer industry and discusses their capabilities. Section IV draws detailed conclusions about the relationship between policy and industrial development.

Firstly, though, one needs to consider the indicators of industrial performance used to measure the impact of policy and other changes.

Measuring Industrial Performance

Many industrial development commentators rely on quantitative indicators, and two used here will be level of overall production and level of exports. However, it is always

useful to look behind such measures at more qualitative data. Lall (1987) identifies 'technological capability' as a crucial determinant of industrialisation, yet one which is ignored by many quantitatively-oriented researchers. Although this indicator does not lend itself to outright measurement, some kind of scale can be drawn up for the technological capability of producers, as shown in Table 1.

Following Lall (1987), one may define technological capability as the general ability to undertake the broad range of tasks outlined in the table, and technological development as growth in the capability as defined by movement up the categories and regardless of whether or not the final stage is attained.

These capabilities are actually embodied in the skills and experience of individual workers, often seen as the most critical resource for information technology (IT) industries [O'Connor 1985, Kumar 1988]. In this case, technological development will be the accumulation of increasingly skilled workers.

II
Quantitative Changes in Hardware Production

Table 2 shows the rapid growth of computer production in India over recent years. The strength of local production can also be measured relative to imports of computers. Table 3 shows the proportion of the Indian market taken by local producers as opposed to imports.

In the early 1980s, local producers serviced the major part of the local market and growth rates were moderate. In the mid 1980s, local production grew rapidly but imports grew even faster so that the large growth in demand was at first met largely by imports, which took the major share of the market in 1985. In 1987, there were falls in both imports and production growth as government investments and foreign exchange were diverted into higher priority areas because of the drought.

There were similar problems with government spending, foreign exchange and industrial growth in the 1990s. But, by the mid-1990s, thanks particularly to a rally in government IT investments, the local industry was still growing in volume terms and once again growing strongly in value terms. Given the rise in OGL imports, local production was slipping against overall imports but, compared with the mid-1980s it had re-asserted itself as the prime source of computers for Indian consumers, making up the majority of domestic consumption.

Indian computer industry growth has been dependent on a number of factors including industrial licensing, overall demand, access to inputs, marketing, prices, technological lag, technological standardisation, and attitudes towards computers in the private sector. Market share is determined by the relative attributes of price, technological lag, quality, accessibility and desirability of either imports or domestically-produced computers.

Import liberalisation has had a partial impact on some of these factors. To summarise this impact, while import liberalisation of kits, peripherals and components has favoured the growth in local computer production, any liberalisation of imports of complete computers has reduced the market share of local producers, as suggested by the figures above.

The rise and fall of market share corresponds to changes in import policy. The market share for local production dropped following liberalisation in the mid-1980s but rose from the late 1980s as import duties and the threshold for minimum configuration of imports were raised. With Indian firms unable to address a large market and so achieve large-scale economies, continuing tariff protection allowed them to compete with imports and achieve increasing import substitution until the liberalisations of the 1990s.

Of course, import policy has not been the only instrument of the Indian government to affect the industry. For example, government helped to engineer the strong growth in India's computer industry through its demand policies. Policies on foreign investment and collaboration have also been key, with most 'local' production in the 1990s involving multinationals.

In other ways too, a lot of computer production within India has not been as 'local' as it might appear. Figures from GoI (1987b), IDC (1987) and Shekhar (1988) suggest that the import content of Indian computers fell by more than 20 per cent between 1982 and 1984, but then rose by over 40 per cent between 1984 and 1987.

By this point, about 80 per cent of the cost (including duties) of components and materials for Indian computers was made up from direct imports. Much of the remaining 20 per cent of components were bought from Indian suppliers but themselves had a high import content. There was some recovery after 1987, with the component industry registering a much higher growth rate and with the overall import content falling to around 60 per cent in the early 1990s [Tandon et al 1991, Raman 1993], before rising again.

Some explanation for this rise and fall of imports can be found in government policy which, in 1984, helped fuel a large increase in demand for computers. Coupled with import liberalisation of complete computers, this led to a large proportion of that demand being met by imports. However, one type of computer, the microcomputer, remained protected, so that companies wishing to respond to demand had to produce them locally and they therefore sought components for these PCs. A number of factors led to the growth in local demand for components being met largely from imports.

Firstly, import liberalisation allowed relatively quick and cheap access to imported components.

There were also technical factors, particularly the emergence of the IBM-compatible PC as a copyable global standard, which Jaikumar and Krishna

(1987) cite as "the single most important factor of change" affecting the Indian industry in the 1980s. Despite certain protective measures, IBM failed to secure exclusive rights to either the PC processor chip or the operating system software and so found that its computer was being reverse engineered by other companies which then produced microcomputers that were compatible with those of IBM but invariably cheaper. This helped the IBM-compatible PC to emerge as a stable and standard technology.

Secondly, this computer was technically relatively simple in the first place. As it became a stable standard, subsequent technical progress centred around making the same computer with fewer parts. This further simplicity enabled companies in South-East Asia to produce PC kits which could easily be assembled into a computer. Both the skill and capital barriers associated with hardware 'production' were thus greatly reduced. Standardisation of the operating system software also allowed hardware producers to avoid needing any software skills.

Thirdly, many Indian companies which wanted to move into PC production were trading companies. They had no background of technical or manufacturing skills and therefore kit assembly was all they were capable of. At least at first, they could not think of trying to integrate imported and local components.

Finally, and despite the increasing local content of computers up to 1984, the Indian component industry was in a rather poor state at that time. It was characterised by high costs, poor quality, outdated equipment, lack of skilled staff, and lack of research and development (R and D). All this left local component producers unable to respond adequately to the growth in demand.

With local computer producers turning to imports, this further weakened the growth opportunities for the local component industry. Only once liberalisations were reversed after 1987 did the local component industry show any signs of recovery, which the post-1991 renewed import liberalisation may well have cut short.

Given the past and likely future state of computer technology and component production, India cannot hope to be self-sufficient as regards computer components. Many components, including the central processor, require too high an investment, scale of production and risk for their production to be a viable aim for India.' Such components can only be imported and so, for these, import liberalisation is the best policy option.

The same cannot be said of other components such as memory chips and specialised processors, and sub-assemblies such as peripherals and computer kits which can be produced by the Indian component industry. In this case, there are alternatives to import liberalisation, but policy-making has always been caught in the conflict between component consumers (such as the computer industry) who favour imports and component producers who want to be protected while they build up their production capabilities.

Computer Exports

The level of computer exports from India is shown in Table 4. Computer exports from 1988 were much higher than previously, which could be taken as an indication of the growing strength of Indian computer production, since exports can be a sign of production efficiency and/or innovation. Exports can also provide the necessary economies of scale to allow globally competitive production.

In reality, though, most of India's computer exports have been basic PCs, which are assembled in India and have a very high import content. Interviews within hardware companies showed that these PCs have little local value added, make little positive contribution to India's balance of trade, and require little technical knowledge to produce. They rely on low labour costs rather than efficiency or innovation to gain a place in the export market.

The stability of basic PC technology has been important because only where technologies are relatively stable, and where product cycles are mature can developing countries hope to compete on cost alone [Cline 1987, Evans and Tigre 1989]. Where technical change is rapid, as it is for more powerful hardware (and, increasingly, for even basic PCs), reliance on low labour costs will not be enough.

The destination of India's computer exports provides further evidence that export performance is not a good guide to technological capability or even efficiency. The majority of such exports went to the USSR or other former eastern bloc countries under bilateral trading agreements, and were paid for in rupees. Since the Indian companies had to pay for the kits or components in foreign exchange, these exports caused India a substantial foreign exchange loss. The exports relied on this for their success – the eastern European countries bought the computers from India only because this avoided the necessity to spend hard currency for new technology. Therefore, Indian firms did not have to be efficient or price competitive to win such orders.

As the eastern European economies were drawn into the international capitalist economic order in the early 1990s and as the Indian government became increasingly unhappy about the loss of foreign exchange, such bilateral agreements were initially dropped and all payments had to be made in hard currency. As a result, computer exports, already hard hit by temporary import curbs in 1991, fell dramatically. However, Indo-Russian trade agreements were later revived so that, by 1995, a large proportion of exports were still made up of new or repeat orders from Russian customers.

There is another side to Indian computer exports – those which are basic technology but which compete on price, and those which are innovative. These only represent a small part of overall exports, and sales of both types have not grown as expected because of market barriers.

Scale of production is an important factor determining production costs and price. A

Table 2: Computer Production in India

Year	Number of Computers	Value (Rs m)	Value (US$m)	Growth Rate in US$ Terms (Per Cent)
1981	800	330	38	
1982	1200	430	45	18
1983	1300	700	69	53
1984	3400	830	72	4
1985	7200	1,400	115	60
1986	c 25,000	2,500	200	74
1987	c 40,000	3,200	250	25
1988/89	c 55,000	5,000	340	36
1989/90	c 78,000	7,000	420	17
1990/91	c 97,000	8,600	480	14
1991/92	c 1,10,000	9,700	395	-18
1992/93	c 1,30,000	11,700	380	-4
1993/94	c 1,60,000	15,900	505	33
1994/95 (est)	c 2,00,000			

Note The figures for 1981-87 are lower than published statistics because the latter included the value of peripherals produced, which made up 10-15 per cent of total hardware production. Figures exclude production for export but include some estimate of "grey market" production.

Source Interviews, Department of Electronics (DoE) annual reports (e g. GoI 1992, GoI 1993, GoI 1994), Shekhar (1988) and Dataquest surveys (e g. Dataquest 1992, Dataquest 1993, Dataquest 1994a and b).

globally competitive scale of production for basic PCs is around 50-1,00,000 computers per year [Cline 1987]. But, with a relatively small yet strongly competitive domestic market and with US and South-East Asian domination of PC export markets, Indian firms cannot sell in anything like such high volumes.

In 1993-94, the largest Indian producer by volume sold just over 20,000 micro-computers of various types, with no more than 8,000 of any given chip type [Dataquest 1994b]. This keeps prices high which, in turn, reinforces the difficulty of selling in high volumes. The difficulty of achieving the scale economies available to foreign producers is one reason underlying the continuing tariff protection on imports. In this situation, one danger of increasing innovative computer exports from India is that these may trigger foreign pressures on the Indian government to reduce computer import protection without opening up scale economies of production to the majority of local producers.

Indian companies face further problems in the export market because computer sales depend on more than just price or innovation. With reliability and long-term support being vital to successful use of computers, company 'name' and reputation count for a great deal. For proof of this, one need look no further than IBM's PC which dominated microcomputer sales during the 1980s despite there being plenty of competitors producing cheaper and/or more technically advanced microcomputers.

Potential Indian exporters stated that they also find themselves hampered by a lack of marketing channels and market information; a lack of finance sources plus the high cost of financing; a lack of skills sources, and a continuing overburden of bureaucratic procedures. The government has followed neo-liberal financial prescriptions by fully recompensing exporters for all import duties and by providing additional export incentives but this has not been enough to overcome the problems listed.

In addition, as automation becomes the norm for computer production, India's low labour costs become decreasingly important[4] and heavy initial investments are required in equipment (and in marketing) to break into the export market. Some of India's large IT firms had automated assembly lines in the 1990s but were finding software exports to be a more lucrative field and were therefore moving away from IT production and the opportunity for 'home-grown' exports. Overseas subsidiaries of HCL-HP (India's leading IT firm), for example, were focused principally on software rather than hardware export.

By 1995, nonetheless, Indian computer policy was changing away from its historical concern with import substitution alone, towards a greater acceptance of the importance of export markets. The Indian government was slowly refocusing its strategy to create more balance between exports and domestic-oriented production.

The export performance of a few Indian firms indicates that the export barriers are not insurmountable but they are great for most firms and they would appear to need to be addressed by a mixture of both liberalisation and intervention from government. As regards import liberalisation, the liberalisation of import procedures has helped exporters get access to necessary inputs more easily but, thanks to 'duty drawback' and similar provisions, they have been insulated from changes in import tariffs.

Liberal access to inputs allowed the Indian firm PCL to export American-designed motherboards to the US company Dell from 1993 as part of a $ 50m contract. This contract reflected an international skill division of labour based on availability of cheap, trained production labour in India. By contrast, the export of four Param supercomputers from the DoE's Centre for Development of Advanced Computing (CDAC) only occurred thanks to government investment and intervention, and was based on the presence of skilled designers in India.

The Param example shows that there are opportunities for export of specialist hardware from India based on local innovation. However given that the major Indian multinationals with the money and international clout to follow a South Korean *chaebol* model[5] are more interested in software exports, any large-scale hardware exports will have to follow the PCL-Dell model of international subcontracting. Given the barriers of scale economies, brand name, marketing channels, finance, skills and quality, a tie-up with a foreign IT multinational is the only way to begin large-scale exports and the MNC must be willing, as Dell was, to invest in India-based production equipment and training.[6]

The government has tried to encourage this model in its 1992 scheme for Electronics and Hardware Technology Parks which have all the usual export unit incentives like duty-free imports, complete foreign ownership and tax holidays. Given the limited importance of low labour costs (especially by comparison with competitor production sites in places like Mexico and Taiwan), the government has offered the other Indian carrot - access to the domestic market for those achieving more than 15 per cent value addition. Few multinationals had seemed attracted up to 1995, and it was a measure of the government's determination that EHTPs be seen to export that, rather incongruously, EHTP units were allowed from 1993 to meet their export obligations from software exports.

Summary and Conclusions

Drawing conclusions from the data presented above is not easy. Many different factors have played a role – both demand and supply policies, technical and global macro-economic factors. At the same time, there are hidden complexities behind the apparently simple facade of both import liberalisation policy and industrial performance statistics. A high level of exports, for example, is no indicator of an industry's capabilities, efficiency or even competitiveness.

What the data does suggest - to be expected when import liberalisation is introduced into an import-substituting industry – is that liberalisation of industrial

inputs helps the industry to grow but liberalisation of directly competing goods does not. At least partly as a consequence of import liberalisation, the great majority of the US$ 4bn spent on computers since the Indian government's 1984 computerisation thrust has left the country – either directly or to foreign component suppliers.

Companies have complained about the harm done to them by competition from liberalised imports and the government itself recognised this, with a 1987 discussion paper [GoI 1987a] arguing for greater protection which "may show reduced growth rates, since a lot of unhealthy growth will have to be pruned to allow slower, but healthier and more sound progress". As a result, some of the earlier import liberalisations were partly reversed at that time, though kit assembly still continued.

India cannot hope to be self-sufficient in new technology. Production of some technologies is beyond its means and there is a recognition of this in the differentiated import policy, which allows such imports lower rates of protection than items which can be produced in India. For the latter, there are scale economy arguments to justify import protection, as well as arguments about building capabilities which will be discussed below. Yet the indications by 1995 were that existing high (relative to international levels) import tariffs will not long survive the tide of liberalisation, whatever consequent impacts and arguments the government might recognise. Added to this, of course, an increasing amount of supposedly local production was actually of foreign brands.

Naturally, government policy stretches beyond import controls and duties. Policies to increase demand and to liberalise industrial licensing and capacity controls have helped to increase local production [Heeks 1995]. Exports have been assisted by financial incentives, though they need more than this to reduce the bureaucratic burden on exporters and to address supply-side constraints. In the 1990s, there was some recognition of this within government policy. Nevertheless, Indian computer exporters face some formidable external barriers and constraints, particularly as their major export market has recently shrunk drastically.

III
Qualitative Changes in Hardware Production

In the previous section, the relationship between import liberalisation and overt measures of industrial development was assessed. Although this relationship was better understood through qualitative data, little mention was made of a crucial qualitative factor - technological capability. In this section, the development of the Indian computer industry's technological capability and its links with government policy will be assessed.

By the mid-1990s, three principal types of Indian computer producer were identifiable, as described below.

(1) Assemblers

These are companies which import the component parts of a computer, assemble them in India and then sell the unit under their own name.

In terms of company numbers, such firms made up by far the majority of the Indian computer industry in the mid-1990s but they were mainly restricted to making bottom-of-the-range PCs. They typically had a very low scale of production, assembling only a handful of PCs per month and often working in the "grey market" (using smuggled parts, pirated software and unregistered sales). However, because there were several hundred such firms and because some larger firms were also assemblers, they supplied a substantial proportion of the domestic PC market (and most of India's computer exports in the late 1980s and 1990s).

Almost all of these firms have come into existence since the 1984 computer policy and they owe their existence to two principal factors. Firstly, the technical features and developments associated with the IBM PC, which were described above.

> Since the products are in the standardised form with no great technological challenges, it is easier for many to set up shop [Bhagnari and Polavarapu 1989].

Related to technical standards and simplicity, the low cost of kits or components and the ability to hand-assemble these computers has further reduced production entry barriers.

Secondly, Indian assemblers owe their existence to the liberalisation of import legislation which allowed such kits or component parts to be imported relatively easily and cheaply. However they also owe their existence to the continued protection which has prevented open import of complete PCs. Above the Rs 0.15m (US$ 5,000) threshold (where open import is allowed) assemblers with anything like a local manufacturing facility had great difficulty competing, especially after the 1994-95 budget which only provided a very small import duty differential between computer parts and finished computers. Given high local interest rates, taxes, and infrastructural costs and low scales of production, this differential was often insufficient for local production to make economic sense.

Because of these problems and because of the scale economies in microcomputer production, assembly companies have to cut costs wherever possible in order to compete. Most hand-assemble the computers using low-paid, low-skilled workers and so avoid high production costs. They rely on sales to their local area to avoid high marketing costs and they do no research and development work. They often work in the grey market to avoid tariffs and taxes.

However, it would be wrong to see assemblers as devoid of technological capability. In fact, there is quite a range of capabilities within this group. At worst, the computer will be imported as a semi-knocked-down kit from Singapore, assembled in less than half an hour using a screwdriver, and then sold. Most of the companies are of this type. At best, the various components (processor, monitor, disk drives, keyboard, casings) will be sourced from different suppliers, possibly including some local ones. Assembly then consists of component insertion, flow soldering and limited functional testing.

In either case, the capabilities are greater than those of trading companies and it is possible that assembly can form the base on which companies build up to higher capability levels.

(2) Design Innovators

Assembly companies do not have a design capability, whereas this group of companies does, and they use this to undertake a range of product innovations. They also manufacture their own computers.

Most design innovation companies are long-established.[7] In the late 1970s and early 1980s, there was a lot of import and assembly work but the Indian computer companies which dominated the microcomputer and minicomputer markets – including HCL, Delhi Cloth Mills Data Processing (DCM DP), Operations Research Group (ORG) and Wipro Information Technology (WITL) – were undertaking design innovation production. That is to say, they designed the overall component layout for their computers' circuit boards and peripherals, then bought in components

Table 5: Type of Active Indian Computer Collaborations – Cumulative Totals

Collaboration Type	1985	1988	1991
Agency	7	9	
Technical	2	18	
Joint venture		8	

Note: Numbers indicate active collaborations in non-specialist computers, and fall if collaborations lapse or cease. Numbers do not tally with those for total collaborations because the nature of some collaborations was unknown.

such as processors from foreign or local sources, put them together to make the computer, and then tested it. Locally produced operating systems, systems and applications software were then added to create a complete system [Interviews, Grieco 1982, Subramanian 1992].

However, in the mid-1980s, all this changed.

> As a result of these policies, computer production in India has become largely an assembly operation, often from kits and is heavily dependent upon imported components and know-how [GoI 1987b].

In the market for basic PCs, design innovators found themselves unable to compete with kit assemblers. They were forced to become kit assemblers themselves, often relying on foreign collaborations, as the General Manager of one of the largest producers, DCM DP, described:

> We didn't have the necessary lead time to develop our own machines. It was a case of collaborate, or lose our market share in this crucial sector. I swung the Tandy deal for the company, but I still feel very sad at its necessity. We had the brains and the infrastructure to design and develop an Indian computer [Pawar 1987]

As well as the lack of development time, fierce competition in this market forced cost cutting. Production and research investments made in 1983 and 1984 were largely lost, profits were reduced and, as Subramanian (1992) states, "The new policy virtually killed local R and D.

A number of capable firms lost their design capabilities. Those which kept them could only afford to invest in R and D in areas of lower competition. R and D staff were therefore moved to work on more powerful computers based on the Intel 80286 and 386 and Motorola chips that came out around this time. Such computers were technically more complex than basic PCs, thus affording temporary protection from kit assemblers. At that time, there were few Indian computer companies with foreign collaborations producing powerful PCs, and the continued and subsequently rising level of import protection ensured the design innovators of sufficient profitability to justify their heavy R and D investments.

Design innovators also benefited from their existing base of capabilities, which allowed them to be accepted as "beta-test" centres for new Intel and Motorola chips, enabling them to work on designs before the new chips were sold on the open market. Import liberalisation had a slight role in improving their access to these chips.

The companies were assisted by a government committee decision. In 1985, the Rangarajan committee issued its recommendations for automation of Indian banks. On advice from the public sector IT firm, CMC, this included the recommendation that the computers to be used be based on the Unix rather than MS-DOS operating system software. Unix is more powerful than MS-DOS and needs a more powerful non-IBM-compatible computer to run it – such as those based on Motorola or Intel 80286 chips. This decision paved the way for a large potential market for Unix-based hardware, further encouraged R and D investment, and so helped to form the base for the hardware innovations of the late 1980s and early 1990s, many of which were Unix-based machines.[8]

Two to three years after the import liberalisation decision, some (but not all) design innovators were therefore able to start reasserting their skills in the market. HCL, WITL and DCM DP were all producing computers "conceived, designed and developed entirely by their R and D" [Jaikumar and Hutnik 1988] and based on the latest Intel and Motorola chips. Their design capabilities ranged from case design to board chassis design to chipset evaluation and printed circuit board design to Application Specific Integrated Circuit (ASIC) design. Each company had well over a hundred R and D staff, and they spent about US$ 10m each annually on R and D, typically working simultaneously on ten or more new designs for main circuit boards, secondary boards and peripherals [Interviews, Hutnik 1988].

All three companies produced machines before any other company in the world. They produced the world's first Intel 486-based computer; multiprocessing board superminicomputer; Reduced Instruction Set Chip (RISC)-based multiprocessing minicomputer; and Motorola-based multiprocessing Unix minicomputer. They also began exporting such machines or their designs, even to the US market.

R and D staff also work on operating systems software. Prior to 1984, most Indian computer companies wrote their own operating systems software but, with the arrival of IBM-compatible PCs and the generic operating system MS-DOS, such indigenous development was no longer required However, design innovators kept writing their own operating systems in areas of relatively low global competition, such as multi-user or multiprocessor operating systems.

The decision to push Unix as an operating system also affected this work because most of the companies obtained Unix source code which they could then modify. All of them made minor modifications to allow Unix to run on the computers they designed and HCL and WITL made some fairly major changes to produce Unix-based compilers for other programming languages, Unix utilities with higher performance than the originals, and multiprocessor versions of Unix. The Department of Electronics helped in this by co-ordinating and funding Unix import substitution work.

Finally, these companies also had a strong manufacturing capability in their large computer manufacturing plants and tended to incorporate a much higher proportion of local components into their computers than other firms, thus aiding the expansion of the local component industry.[9]

So, a number of smaller companies with design and production capability in the early 1980s did not fare well. After 1984, they found themselves unable to compete or invest effectively against imports. They shifted to assembly-type production and to agency collaborations, and moved design staff into simpler jobs, into marketing or lost them to companies with substantial R and D teams. As a result, these companies slipped well down the "league table" of producers.

On the other hand, a number of firms which built up skills during the early 1980s were able to maintain those skills during the 'dormant' period of the mid-1980s and then reassert them during the late 1980s and early 1990s. Such a process helped these companies maintain their dominant position in the Indian market. HCL and WITL are the clearest examples, constantly among the top three or four largest sellers from the late 1970s/early 1980s and, respectively, the largest and second largest IT companies in India in the early 1990s. Similarly in 1991-92, other old-established innovators – Zenith and Minicomp – still appeared in the top eight microcomputer makers [Dataquest 1992].

However, after this date, design innovation skills began to ebb away with the growth in demand for, and availability of, foreign brands. DCM DP, for example, performed strongly until the end of the 1980s but was then badly affected by internal wranglings

TABLE 6: SUMMARY OF INDIAN COMPUTER PRODUCTION IN 1995

Computer Type	Position in 1995
Microcomputers	Competition between kit assemblers and design innovators; increasing penetration of foreign collaborators
Minicomputers and workstations	Competition between foreign collaborations and design innovators; imports rising
Mainframes	Domination by foreign collaborations and imports

and, after the liberalisations of 1991, began to move out of innovation and manufacture into trading. It changed its name to DCM Data Systems and its R and D unit was converted into a Technical Services unit providing consultancy work. Zenith's R and D department was likewise transformed into a marketing and technical support division. Minicomp – without a foreign brand tie-up – became just a small assembly firm.

After the tie-up with Hewlett-Packard, staff in HCL's R and D division were transferred to work on HP research projects and WITL was similarly trying to hire out its R and D facilities to multinationals. Some R and D capability remained – as evidenced by the production of the HCL Meteor and WITL Synergy hardware range – but was coming under pressure from competing products produced by multinationals with whom the Indian firms now had a tie up (HP and Sun or Acer respectively).

Interviewees saw a shift from 'fundamental R and D' to 'value added R and D'; the latter meaning systems integration for specific customers or, at best, some hardware and software customisation. By 1995, even the manufacturing capabilities of these firms were under threat for higher-end machines given the lack of import duty differentials between parts and finished computers. Harindranath (1995) therefore draws the pessimistic conclusion:

> Liberalisation, and the accompanying globalisation, has done away with any incentive for investing in R and D or manufacturing. The R and D investments that some Indian firms used to make have become irrelevant, unviable and even unnecessary with liberalisation since 1991, and the consequent easy access to state-of-the-art technology.

R and D strength only remained in still protected areas. For example, thanks partly to the US government's earlier block on export of a Cray supercomputer, at least four Indian parallel processing supercomputers had been designed and built by the mid-1990s: ECIL's Anupam system; C-DAC's Param (in collaboration with Tata Unisys); the National Aeronautical Laboratory's Flosolver (in collaboration with WITL); and the Centre for Development of Telecommunications' Chipps-16.

(3) Collaborators

These are Indian computer companies which import much of the technology for the computers they produce. They import it from a foreign hardware firm with which they are in collaboration. Collaborations can be agency operations or technical collaborations or joint equity ventures which manufacture computers in India.

The nature of the local company's activity varies from being agents for complete computers imported with a government licence, to assembly of knocked-down kits, to hardware systems integration in which they bring together imported circuit boards and monitors with locally-produced disk drives and operating software.

The number of such computer collaborations has risen sharply, from 12 in 1985 to 29 in 1988, 31 in 1991 and 65 in 1995. The nature of foreign involvement has also changed, as shown in Table 5.

There has been a change over time from domination by agency work in the early 1980s, to domination by collaborations involving production in India in the mid-late 1980s, to re-domination by agencies in the 1990s, with a steady increase in joint ventures.

What has led to the overall increase in collaborations? Although the 1984 hardware policy brought no explicit changes to foreign collaboration policy, such collaborations were made procedurally easier to undertake. However, this does not explain the increase.

Indian companies seek out such collaborations as an alternative to investing in R and D, as a way to access the most recent technologies, and because some feel that foreign technology must be better than that which is produced locally. In a competitive market (seen in the heavy demand of 1985 and the cutbacks of 1991) those with few R and D-related resources or inclinations are tempted to take this route or, like DCM DP in the quote above, they may feel forced to do so. This feeling is strengthened by the preference Indian consumers have shown for imported rather than indigenous technology, over and above considerations of cost or performance.

The technology involved is a variable in this. For example, the technical complexity of mainframe design and production and the proprietary nature of mainframe processors, circuit board designs and operating systems has meant that entry into most mainframe production is currently not a viable strategy, and India has had to rely on foreign collaborations.

Foreign suppliers have been pushing such collaborations as the hardware market in India has grown. They tie up with Indian companies to ensure that their products are well marketed and supported. They push for production in India to take advantage of low production costs; to avoid import licences and duties on complete computers; and to achieve greater control over the decision making of their Indian collaborators.

Import liberalisation of components and peripherals will have encouraged the growth in local production, though so too has continued import protection of complete computer systems. Foreign companies come to manufacture in India partly in order to avoid this import barrier. With the barriers reduced in the 1990s, most collaborations scrapped or reduced their in-India manufacture or shelved plans for any future investment, and agency links expanded rapidly.[6]

Given the background of many collaborating companies in trading or assembly, it is not surprising that their technological capabilities were generally lower than those of design innovators. As a generalisation, one can say that many collaborating firms lie between assemblers and design innovators on a scale of technological capability.

Capabilities in agency operations were largely restricted to software services, while R and D in other types of collaboration was more limited than that of the design innovators. From the research surveys, it appeared that there were fewer R and D workers in collaborating companies and that they were oriented more towards local sourcing of components, and towards the development of applications software and other adaptations to local conditions rather than towards design innovations. The work of one such company in the late 1980s was typical:

> We are not involved in any basic developmental work in the strict sense of the word. Rather we would like to look at a product and see what enhancements we can offer, by way of system software, operating systems, ruggedisation, etc [Jaikumar and Hutnik 1988].

These collaborating companies therefore rely on the R and D carried out in developed countries and embodied in imported technology more than on their own efforts.

Table 7 Models within the Indian Computer Industry

Period	Dominant Model for Trade	Dominant Model for Consumption/Production	Dominant Model for Ownership
1960s	Imports	Consumption	Multinationals
1970s	Import substitution	Production	Public sector
1979-83	Import substitution	Production and consumption	Private sector
1984-87	Imports	Consumption	Private sector
1987-91	Imports and import substitution and some exports	Consumption and production	Private sector and multinationals
1990s	Imports and some exports	Consumption and some production	Multinationals and private sector

Because of the opportunity costs of this form of production within a technologically capable industry and the competition with more capable local firms, collaboration has therefore tended to reduce the extent of local design and research and development work. The Indian firm PSI's R and D capabilities were reduced to just a handful of systems integration staff when it was taken over by the French computer company Bull and, as noted above, HCL's capabilities have been redirected after the HP tie-up. The major expansion of agency operations in the 1990s only served to strengthen this overall reduction in capabilities.

Summary and Conclusions

There is no sharp division between the categories described here but more of a continuum of capabilities from assemblers through collaborators to design innovators. The different activities can also be found within the same firm. WITL, for example, designs and produces its own microcomputers, builds workstations in India through a technical collaboration with Sun Microsystems, and is the agent for imported Convex minisupercomputers.

There is also movement between the categories. Some of the firms which developed as design innovators in the early 1980s began life assembling imported goods, sometimes through collaboration with a foreign supplier. Conversely, some firms which were designing and building their own computers in the early 1980s or early 1990s later relied entirely on imports and collaborations. However, none of the assemblers or foreign collaborators that began in the wake of the 1984 liberalisations had shown itself capable of any substantial design or innovation work up to 1995

The historical trends within the industry can be seen more clearly in terms of computer types. Assembly has always been confined to microcomputers and seems likely to stay that way. It was slowly widening from basic PCs to more powerful machines before contracting again in the mid-1990s. Design innovators built up their capabilities on microprocessor-based systems. As microprocessors have become increasingly powerful, they have been able to form the basis for minicomputers and even "superminicomputers" as well as microcomputers. The capabilities of these companies have therefore been migrating up the computer system spectrum in line with technical changes.

Throughout the 1960s, 1970s and early 1980s, collaborations remained largely confined to the realms of mainframe computers. However, since that time, they have migrated down the computer system spectrum. At the end of the 1980s, there were only one or two major micro-computer production collaborations as part of a larger collaboration agreement but several minicomputer and workstation collaborations including many of the major world producers such as DEC, Unisys, Hewlett-Packard, Bull and Olivetti. By 1995, microcomputer collaborations were more numerous and had also begun to include major players, not the least of which were Compaq and IBM. By 1995, the computer market in India could therefore be summarised as indicated in Table 6.

In 1990, one could have taken a positive view of the Indian hardware industry. At that time, some Indian companies, including the two market dominators, had a wealth of capabilities. They designed their own hardware, importing only those components, such as processors, which could only be produced by the largest multinational corporations They had produced leading-edge designs and exported their computers to developed country markets. They had substantial manufacturing capabilities but it was in design – of both hardware and operating systems software – that they excelled Thanks to this and to export barriers, they had been more successful at exporting designs than computers.

Computer and kit import liberalisation in the mid-1980s had been potentially very damaging, but these companies were able to divert skills and resources into more protected areas, aided by government policies on imports and foreign collaborations They benefited from liberalisation of component imports but also from government demand policies, particularly the Rangarajan committee report.

A critical problem for computer industries in developing countries has been the question of how to move beyond just producing IBM-compatible computers [Evans and Tigre 1989]. The Indian hardware industry had been able to do this, thanks to the Rangarajan decision that can be regarded as either very fortunate or very far-sighted given that Unix was not very widely used in 1984 but subsequently grew rapidly in the workstation and minicomputer market, with a global market around worth US$ 20bn in 1991 [Schofield 1991], as well as strong growth within India itself.

In 1990, most of the other Indian companies had some technological capabilities, ranging from simple technology choice and assembly to systems integration and adaptation. Had open import of complete computer systems been permitted, these would have been unlikely to have developed, or to have developed to such an extent, and they provided a base which could potentially grow into higher capabilities.

By 1995, however, the picture was different and was not so positive. The vast majority of companies were hand-assembling imported kits, often for the grey market, while companies which relied on foreign technology collaborations were experiencing rapid growth, leaving only a handful of genuine indigenous producers in certain narrowing market sectors.

The computer industry is highly R and D-intensive, with US companies spending an average 8 per cent of revenue on R and D [Subramanian 1992]. By comparison, Indian computer companies spent, on average, 1 per cent of revenue on R and D and most small companies spent nothing. As made clear above, import liberalisation has played an important role in this.

> Overall the import of technology into India has very often been a substitute rather than an input to Indian R and D [Swaminathan 1988]

Hardware import liberalisation has led to "hundreds of assembly operations with little to show in the way of indigenisation of know-how or components" [Bagchi 1990], and has assisted the growth of foreign collaborations.

The flood of imports and foreign collaborations following the 1984 policy change drowned out local capabilities which had been nurtured during times of greater protection against imports. Once the floodwaters of import liberalisation began to recede after 1987 some firms had lost their capabilities but in the strongest of the pre-liberalisation companies those local capabilities had re-emerged.

However, by 1995, the signposts to the future did not bode particularly well for these firms. HCL and WITL – those paragons of design innovation – seemed in danger of losing their capabilities or at least subsuming them to the requirements of multinationals. Manufacturing within India of many computer types had suffered a severe blow, removing another source of capabilities.

What were once independent local hardware firms therefore faced four routes forward: (i) tie-up with a multinational; (ii) try to find a protected niche market; (iii) move into systems integration; and (iv) move into another area such as maintenance, training or software. Concern about hardware capabilities had slipped well down the agenda for discussion and firms were re-focusing on software as more and more became agents for the multinationals.

IV
Overall Conclusions

Has the Computer Industry Gone 'Full Circle'?

There are, indeed, signs that – largely thanks to liberalisation – the computer industry is swinging full circle back to the days of the 1960s. Foreign tie-ups, foreign brand names and access to the latest imported technology are once again the

order of the day. WITL's recent link-up with Apple and Acer, and ECIL's link-up with IBM via Tata Information Systems (TISL) mean that only two major Indian hardware firms in 1995 had no foreign microcomputer collaboration – Zenith and Minicomp. Both were experiencing negative growth. Consumption, not production, is again the focus, and most so-called Indian 'computer' companies actually just produce software for integration with imported hardware.

IBM's return in its joint equity venture, TISL, has only served to reinforce the "full circle" image. TISL's original intention was to undertake kit assembly (rather than manufacture) in India, but even that limited idea of production was shelved and the company expressed an interest in moving back into maintenance – a major bone of contention in the 1970s. Just to drive the cyclical message home, in 1992 Prime Chemfert Industries signed up with a German company to sell that time-honoured stalwart to the Indian market - refurbished second-hand IBM mainframes.

Of course, there are differences to the earlier period. In those days, there was no production of any kind within India. Now, at least, there is significant production and some exports in an industry that employs many thousands of people. Software, especially software exports, plays a far more important role within the industry. Thanks to the creation of local capabilities during import protection, at least some of the MNC tie-ups are closer to partnerships than dependent relationships.

Nevertheless, the current situation is very similar to that of earlier years, as summarised in Table 7, and increasing liberalisation brings increasing similarities.

Overall, the Indian computer industry seems in danger of having travelled a very long way to get not very far.[11] Both government and industry are in danger of losing their nerve in the face of the perceived momentum of consumption and liberalisation, running the risk that carefully-nurtured capabilities will be destroyed and that India's hardware industry may become a thing of the past.

Role of Technology

Policy is not the only factor affecting industrial development. The nature of the technology and of technical change has clearly been an important element in the development of India's hardware industry. Falling real prices of components and computers, the arrival of the microprocessor and the simplicity of the PC standard have all assisted the growth of production in India and the entry of small firms.

The speed and cost of technical innovation have also affected production. Where technology has been relatively stable, Indian firms have found it easier to enter and even be price competitive internationally. Where technology has been fast changing and innovation costly, fear of obsolescence has discouraged investment. In some cases, only the most capable and innovative firms have been able to compete and even they have not achieved any fundamental innovations. In the case of most types of mainframes and most processors, Indian firms cannot hope to compete at all because of the huge R and D costs involved.

Local production decisions have also been partly determined by the proprietary or generic nature of technologies. Generic operating systems have stifled major software innovations but have enhanced minor innovation, opened up wider markets for hardware design innovators, and helped small firms become hardware producers. Proprietary operating systems and processors, where well protected legally, have 'locked out' all except those that are willing to enter into collaboration with the supplier.

All this means that the Indian IT industry, like that of all nations, cannot hope to achieve technological independence. It must import some computing and component technologies even if it can produce others locally. Technology import policy and foreign collaboration policy should therefore be differentiated according to the type of technology.

Impact of Non-Import Policies

Though import policy is a key part of government efforts to build an indigenous industry, complementary policies also matter.

Controls on foreign firms and imports need to be supported by promotional measures to encourage local adaptation of imports and local research and development. By the same token, government intervention to promote the development of local capabilities is never more needed than during periods of import liberalisation [Bhagavan 1995, Chaudhuri 1995].

The coupling of government demand policies with some level of computer import protection has been central to the growth of production within India, offering additional demand, demonstrator effects to the private sector and learning opportunities for some Indian IT companies.

Policy on hardware export has done relatively little to address export barriers. For many years, there was a legacy of India's negative experiences with computing multinationals in the 1960s and 1970s, making policy more concerned with import protection than with other aspects such as export promotion. The need for government action to help redress the balance between domestic- and export-oriented production was only recognised in the early 1990s.

As well as the policies, the phasing of such policies may also be important. For example, many writers[12] feel that a period of strong domestic competition needs to come before any import liberalisation. This was the case in Indian hardware policy with the major relaxations in industrial licensing preceding import liberalisation by several years.

> The experience of the Indian computer industry demonstrates that a protection against foreign competition has to be accompanied by a high level of domestic competition [Brunner 1991].

This combination has been beneficial, with the competition encouraged by licensing liberalisation in the late 1970s coupled with some protection leading to consumption benefits and the build-up of computer-related technological capabilities which have been so important to India's hardware industry during subsequent years.[13]

Impact of Import Protection

One of the catch-phrases used by interviewees in favour of liberal imports was "let us not re-invent the wheel". They argued that it was wasteful to try to develop technologies locally when such technologies could more quickly and cheaply be imported. This outlook takes only a static view of the situation and it also neglects India's experience in the 1960s, when the lack of local production capabilities left the country dependent on imports of outdated equipment from multinationals.

The protection from imports offered between 1972 and the early 1980s allowed Indian firms to re-invent a few 'wheels' by reverse engineering foreign products. As a result there was a build-up of indigenous production and indigenous technological capabilities, particularly design capability.

> The consequences of a policy of protecting not just production, but also 'know-why' is that India has developed a capability to both manufacture and design a wide range of industrial products [Weiss 1988].

Local firms therefore gathered strength during this sheltered period and it is this, more than anything else, which provided the base for the impressive growth and design innovation seen in a few large firms. Protection, and the consequent increase in technological capabilities, also helped to reduce technological dependence on the multinationals and to compensate for Indian firms' difficulties in achieving scale economies through exports.

> For most developing countries, a certain amount of protection would appear to be necessary to counterbalance the enormous technological and cost advantages enjoyed by the computer industries of the advanced industrialised countries [O'Connor 1985].

There seems little doubt that government intervention to protect industries helps indigenous technological capabilities to grow, and that technological capabilities in a new industry will not grow without some protection.

In the 1980s and 1990s, it was only where protected from imports (and the foreign collaborations that bring them) that Indian companies were able to develop hardware development design skills. If, instead, India had continued to rely on foreign imports – as it was increasingly doing in the 1990s – it is hard to see how local production capabilities could have been built up.[14]

An alternative to protection is the use of subsidies to local producers which, it is argued, creates less economic distortions than protection [Helleiner 1992]. But where, as in India's case, government financial resources are too limited, protection remains a second-best option.

Impact of Import Liberalisation

There are signs that Indian producers were becoming more efficient and were building more up-to-date, competitively priced products during the early part of the 1980s. Had policies remained the same, it is possible that the producers would have carried on competing and improving behind the barriers of import protection.

However, the computers produced at that time were more costly and less up-to-date technically than world standards. The combined arrival of the IBM PC and of Rajiv Gandhi as prime minister shifted the focus from the benefits of protection for local production to the costs of protection for local consumption. The dominant concern came to be that import protection was allowing the Indian industry to be insulated from global technological progress and efficiency levels. Imports of both components and computers were duly liberalised.

Introducing import liberalisation into this import-substituting industry allowed the massive increase in demand to be met largely by direct imports, by import and assembly of computer kits, by foreign collaborations, and by a large outflow of foreign exchange. All of these had a role to play in the suppression of local research and development and of local technological capabilities, and the signs were that the same thing will be repeated in the latter half of the 1990s.

What local production and capabilities there were during the earlier period remained partly through continuing protection. Only those firms with technological capabilities that pre-dated the major import liberalisations still had those capabilities in the late 1980s and early 1990s, though protection also encouraged some level of capabilities in assembly and collaborating firms that might not otherwise have arisen.

As already discussed, import liberalisation did help to bring some benefits to consumers; and it may have had a positive effect on those firms with pre-existing capabilities which survived the mid-1980s. The director of one such company stated that there had been benefits in import liberalisation in that his company and others like it "are now more alert to competition, to advances in technology, etc".[15]

Cline (1987) and Weiss (1988) review evidence of successful policy strategies from both India and China and conclude that while initial protection is needed to build capabilities, "there are limits to this process, and that beyond some point an infusion of foreign technology and imports will be required to strengthen and complement domestic resources" [Weiss 1988].

This therefore suggests the possible utility of some kind of phasing of import policy, with import liberalisation following import protection.[16] However, two points are worth making. First, it is widely seen that import liberalisation in the mid-1980s went too far, with subsequent policy reversals showing that "the Government is tacitly accepting its mistake in opening the import-window rather too wide" [Datt 1987]. There are similar concerns about the liberalisations and potential liberalisations of the 1990s.

Second, any benefits to design innovators were more from liberalisation of component imports, which they could use to upgrade their systems, rather than kit and complete systems imports, which merely provided direct competition. Any impetus from such competition and from technology upgradation gains must be set against the skills loss in those firms which gave up design innovation in the mid-1980s and against the impact of component liberalisation on the component industry. Although this research did not include a detailed qualitative survey of the Indian component industry, it seems certain that component-related capabilities were suppressed by imports [see, for example, Mody 1985 and Chaudhuri 1995].

Overall, then, one can take no simple, polarised view of either foreign collaboration or import liberalisation. Many Indian companies have sought and welcomed collaborations. Collaborations may also form the basis for some build-up of technological capabilities but they have more often been associated with a loss or stifling of such capabilities.

Similarly, import liberalisation has produced a form of growth but also a type of dependence, with improvements in consumption-related factors being matched by growing dependence on foreign sources of technology and innovation, and a lack of local capabilities:

> More liberal policies have assisted the growth in consumption, but have not really helped develop the technology *per se* [Subramanian 1992].

Fortunately, in earlier times, the Indian government has never permitted complete import liberalisation, always retained some protection, and reversed liberalisations once their negative implications became clearer. By 1995, however, this no longer appeared true, and the dangers of existing and future liberalisations were considerable.[17]

Importance of Government Policy

> In the case of the United States, Brazil and South Korea, government action has been instrumental in supplying an impetus for the domestic industry to move beyond an historic status quo. We have found a similar situation in India [Brunner 1991].

Despite the other factors described above, policy has been an important determinant of the changes in hardware production within India. During the 1970s and 1980s, even when liberalising, the government retained strong control over imports and other activities and even in 1995, it remained a powerful influence.

In the past, it has also retained the ability to react and to change policy when necessary. This article has shown that throughout the history of the hardware industry, reactions and changes in government policy have been the dominant factors delineating the changing phases and nature of the industry.

During the 1970s, government hardware policy was successfully modified to address the two principal problems relating to computers – firstly, the complete dependence on multinational firms and, later, the dependence on a single, poorly performing public sector company. The main mechanism used was the alteration of controls over industrial entry, capacity and foreign collaboration.

During the 1980s, government policy was successfully modified to address the problems it then identified – firstly, the low levels of use of the costly, out-of-date equipment produced locally and, later, a re-emerging danger of import dependence and loss of technological capability. The main mechanisms used were demand stimulation and alteration of import controls. During the early 1990s, import policy again changed to address the overriding problem of foreign exchange availability.

Of course, no government is perfect. It is arguable that the Indian government 'overdid' the industrial protection of the mid-1970s, the import liberalisation of the mid-1980s, and – most of all – the liberalisations of the 1990s. Nevertheless, until the 1990s, it successfully responded to the problems created and modified policy in order to help solve them. Partly thanks

to this, by 1995 there were around 9,00,000 computers installed in India compared to only 1,000 in 1980. Yet, at the same time, the Indian hardware industry had grown strongly, with hardware revenues exceeding US$ 500m in 1993-94, including those of a few companies which were still designing and building computers at the forefront of hardware technology.

Thus, over and above any particular findings about protection or liberalisation, it is the government's ability to change and apply various appropriate policy measures that can be held at least partly accountable for the positive developments in Indian computer use and production. What is not clear is whether, in 1995, the government still retained flexibility and choice over policy or whether certain liberalising policy trajectories had to a large extent been taken out of its control.

Timing and Type of Policy

> Government intervention is apt to be essential but what form that intervention takes is critically important [O'Connor 1985].

Import liberalisation can help to bring benefits to some consumers and some consumption-related developments, but can be harmful to some producers and production-related developments. Import protection has arguably more virtues but, while some form of protection may always have a positive developmental impact, continuous high levels of protection are likely to lead to inefficiency and to a greater concern with local sourcing and adaptation than with innovation and use of up-to-date technology.

Therefore, there can be no sweeping prescriptions about the form of government policy. Both liberalisation and protectionism may have a place, but timing is critical.

As regards computers, the Indian government started by allowing imports; then closed them off to help build local capabilities, opened them again to allow technology to be updated, and then closed them off again to preserve local capabilities. It seems certain that neither continuous rigid import protection nor continuous import liberalism would have been appropriate strategies to produce the growth of, but also balance between, production and use.

This is not to argue that the open-close cycle is necessarily the recipe for success in other industries or countries (though it might be). Instead, policy choice at any given time should be determined by the present state of industrial capabilities, relations with foreign companies, changes in technology, changes in the global macro-economy, and the balance of government concern between local consumption and production. Governments therefore succeed by continually monitoring industrial and external circumstances: by avoiding dogmatic ideologies; by being selective in their policy choices; and by a mixture of some planning and some reaction to the circumstances they find.

Notes

[The findings reported here derive from ongoing research work into the development of Asian IT industries. This has included several periods of fieldwork in India and, unless otherwise indicated, figures and opinions presented here are drawn from fieldwork interviews and surveys.]

1 There are three main categories of computer listed here in decreasing size/power order: mainframe, minicomputer, microcomputer/PC. Although still useful, this categorisation has been breaking down for some time. Some Indian-built 'supercomputers', for example, are based on microcomputer processors, yet are more powerful in certain ways than many mainframes.

2 Hardware will be taken as being synonymous with 'computer' and not to include other goods such as peripherals (disk drives, monitors, keyboards) and components (printed circuit boards, microprocessors); though the latter will be referred to.

3 Mody (1985) and Mahalingam (1989) point out that most developed countries, except for the US and Japan, have found it very hard or impossible to sustain a microprocessor design and manufacture capability. For example, whereas Intel's first microprocessor, the 4004, cost US$ 60,000 to develop in 1970, its 486 chip cost US$ 500m in the late 1980s (PCW 1990).

4 Labour costs in 1993-94 were estimated to be somewhere between 6 per cent and 15 per cent of total IT production costs in India [Interviews Kapur 1993, Harindranath 1995].

5 The South Korean government helped the formation of a number of large conglomerates, *chaebol*, with the resources to create international brand names.

6 By 1995, there were a number of successful Indian IT firms following this model - PCL, Silicon Valley Technologies and members of the Tandon group (Advance Technology Devices, Tancom Electronics, Ultra Tek Devices). They had tapped into the booming market in hardware outsourcing created by the intense competition between the PC-producing multinationals, but were therefore exporting computer parts and sub-assemblies rather than actual computers.

7 Most of the companies started microcomputer or minicomputer production in the years 1978-82 though start year in itself can be misleading because all the companies began by hiring staff who already had skills from previous work in other computer or related firms.

8 As in Brazil, this government decision also paved the way for the development of specialist skills in computerised banking systems.

9 There are likely to have been other externalities thanks to the build up of local technological capabilities, with spin-offs from the development of a pool of skilled workers and from hardware innovations. It was found from interviews, for example, that design innovators provide more local employment per computer sold than assembly companies.

Concept

PANCHAYATS AND THEIR FINANCE

M. A. Oommen and Abhijit Datta

77pp (568-X) Hardbound Rs. 150

The papers in the volume review the existing structure of Panchayat Finance in historical context, discuss the important principles and problems of inter-governmental transfers as well as focus attention on the conceptual and operational problems before the State Finance Commissions in relation to Panchayat functions and finance.

M.A. Oommen is currently Senior Fellow, Institute of Social Sciences, New Delhi.

Abhijit Datta is currently Senior Fellow, Institute of Social Sciences, New Delhi.

10 Given that this was affecting local assemblers, local design innovators and other sectors as well, some commentators (*EPW* 1994) were starting to talk about the 'deindustrialisation' of India

11 The recent description of policy changes after 1991 as "a 180 degree U-turn" (Vittal 1994) is thus apt As anyone can demonstrate, doing a U-turn will bring you back to where you started

12 Such as Ghosh (1987), Patel (1987), Lucas (1988), Foley (1989), Jain and Sanotra (1993) and *EPW* (1994)

13 Though, of course, too high a level of competition may stifle capabilities and innovation.

14 To provide a concrete example, in the early 1990s, the author conducted a survey of the Malaysian computer industry The Malaysian government has maintained an open import policy Although other factors, particularly market size, have an impact, the lack of protection was at least partly responsible for the Malaysian computer industry's heavy reliance on the import of complete computer systems A few companies were assembling imported kits but none had any design capability in either hardware or systems software

15 Chaudhuri (1995), too, reports a stimulating effect of imported technology on R and D in electronics firms, though that this effect is only 'limited'

16 A strategy recommended by many writers, including Evans and Alizadeh (1984) Kaplinsky (1984), Schmitz (1984), Fransman (1986), Cline (1987), Bagchi (1990) and Helleiner (1992). Those who believe that protection must have a designated end-point disagree over the protection period, though those closer to neo-liberalism argue for a much shorter time-span than others

17 For example, an intention to reduce the minimum unlicensed import cost of computers to Rs 30,000 (US$1000), "which could blow most totally Indian operations out of the water" [Bhimal 1993]

Designing Policy Initiatives in Emerging Economic Environment

Case of Indian Computer Hardware Industry

Rajnish Karki
Ahmad Cameron

Since the mid-1980s there has been a perceptible shift in the role of the government from 'doer-controller' to 'facilitator-intervenor' vis-a-vis the industry. The experience of the computer hardware industry in which the government role has always been of 'facilitator-intervenor' can hold important lessons for policy initiatives in the future.

Introduction

POLICY announcements made by governments are declarations as well as directions which it shall be taking to achieve national objectives. These policies bring to the forefront new opportunities and remove certain constraints keeping in view the overall development of the nation. In November 1984, the New Computer Policy (NCP) was announced by the government of India. Enterprises which took the lead in implementing this policy were largely from the private sector. As a result, the experience of the computer hardware industry can act as a good example to analyse the interactions between public policy and the activities of the corporate sector within the ambit of the economic liberalisation underway at present.

Six variables have been identified which capture the computer hardware industry scenario. These variables along with the policy initiatives are considered to form one system. Systems analysis approach has been applied to analyse the interactions between various subsystems. Keeping the NCP as the point of reference, the case of computer hardware industry from 1984-1990 has been analysed to draw con-clusions. This has led to the identification of certain pointers for designing govern-ment initiatives in the currently changing Indian economic scene with its ultimate objective of globalisation.

Systems Approach

Social, economic, political and technological sectors of countries are extremely complex in characteristics. Each one comprises a number of subsystems interacting with one another within the entire whole. All these subsystems constitute to make larger and complex super-systems. Certain sectors have a direct link with global developments, e g, economic, technological, etc Understanding the dynamics of such sectors becomes even more difficult. Thus policy designers and formulators have to understand the dynamics of the given sector within a complex mosaic of the nation. In recent years, systems analysis has been successfully applied to policy analysis and design [Srivastava 1979].

The systems analysis approach involves definition of objectives; identification of subsystems, including their characteristics, boundaries and interrelationships; and analysis of the system so as to explore alternative ways to achieve the objectives. This approach helps policy framers to understand the inter-dependencies among the subsystems so as to plan a set of actions-interventions (policy) which eases the restrictive factors, strengthens the supportive factors, or add some new sub-systems or interdependencies. On close examination of the data on Indian Computer Hardware Industry (ICHI), subsystems which capture the whole gamut of computer industry need to be outlined. The following subsystems and their characteristics can be identified for analysing the 1984-1990 period:

(1) New Computer Policy (NCP) of November, 1984. The provisions of the policy which have direct influence on the evolution of computer industry.

(2) Computer Technology: Domestic technology developments are closely linked with the developments taking place around the world. Foremost is the development of computer architecture, which in turn is based on the developments in integrated circuits (IC) technology. The developments include the launch of new products, import substitution, newer applications of computers, e g, engineering analysis and manufacturing, integration of computers and communications technology. This subsystem also include developments in software.

(3) Human Resource: Changes in the number and proficiency of computers users in the country. This subsystem captures availability of consumers of output of the computer industry.

(4) Extent and type of computer usage: This subsystem captures expansion of demand for computers, both in terms of new users and new applications. It also includes specific initiatives, government or otherwise, which facilitated expansion.

(5) Indian computer hardware industry: This subsystem consists number of enterprises active in the industry, market shares and sector (public or private), technology competencies, and marketing reach

(6) Indian economy: This subsystem captures overall economy and industrial growth which have a direct impact on the evolution of computer industry.

These six subsystems are considered to be constituents of Indian computer hardware industry (see the figure) In the next section each subsystem is described in detail for the period 1984-90. The focus is on describing the changes, while trying to analyse the changes in terms of inter-dependencies on other subsystems. The key here is that policy initiative is considered as just one subsystem.

Indian Computer Hardware, 1984-1990

The era of computers and computerisation began in India in 1955 At ISI Calcutta a Russian computer was installed in that year. The second system that came up was IBM 1400 at Standard ESSO – a multinational company. Next to follow were Hindustan Aeronautics and TIFR, Bombay. The period between 1955-77 saw the dominance of IBM as it controlled 70 per cent of the Indian market. This phase saw IBM bringing in those punched-card systems which had become obsolete in the developed countries. IBM concentrated on the research and academic institutions of India who were on a look out for computing facilities. It provided extensive maintenance support.

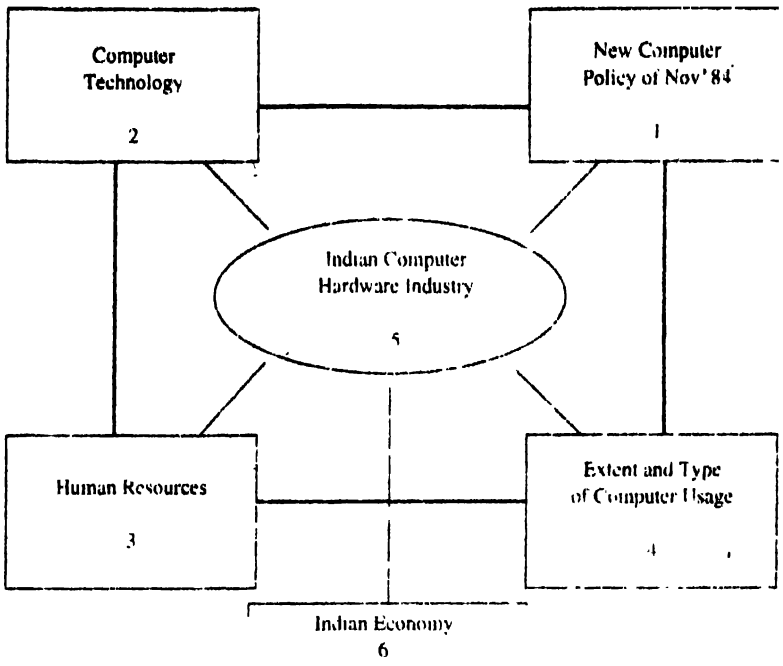
IBM dominated the Indian market till 1971, when it ran into an argument over providing computer systems and services in India. This event became a turning point in the evolution of computer industry in India. A committee under the chairmanship of M G K Menon was established. Its recommendations gave rise to the establishment of Electronics Commission in 1971, Computer Maintenance Corporation (CMC) and Semi-Conductor Complex (SCL) in 1976. Organisations such

as Electronics Corporation of India (ECIL) established in 1967, got a boost during this period and entered computer hardware industry. Simultaneously, Central Electronics active in related activities was brought under department of science and technology in 1974. By 1977 the government had realised the importance of information technology. Government had taken crucial initiatives which finally paved the way for the eventual growth of computer industry in India (Public Enterprise Survey 1988-1989).

There was one major landmark during this period, which was though not directly related to computer industry, had a lot of bearing on its growth eventually. This was the promulgation of Foreign Exchange Regulation Act of 1974 (FERA). By virtue of it, foreign companies operating in India were allowed to hold only 40 per cent equity. This became a catalyst in the process of exit of IBM from India in 1977, when it refused to dilute its equity. IBM which had earlier leased its machines to various Indian organisations, transferred its systems to them for a final payment

The exit of IBM created a major vacuum in the field of systems maintenance which was plugged in by CMC. On the other hand, ECIL started the production of 12-bit systems and subsequently progressed to produce 16- and 32-bit mainframes comparable to French IRIS 55 Systems. Private sector made its entry into the computer market through calculators. Private sector companies such as DCM, Televista, Omron, HCL, and even ECIL launched desk-top and pocket size calculators In 1978, HCL and DCM launched microcomputers for standardised business applications like payrolls. By 1983, several private sector enterprises had launched more powerful microcomputers for a variety of applications, while Wipro and HCL had launched minicomputers also.

The government announced the New Electronics Policy in 1983, and reduced customs and excise duty on electronics industry By 1983 private sector enterprises dominated the computer hardware industry, and there was reasonable amount of competition. Several companies like HCL and Wipro had developed their proprietary hardware and operating systems.



Subsystem 1 – New Computer Policy 1984: Some of the salient features of the New Computer Policy (NCP) announced in November 84, soon after Rajiv Gandhi assumed power were:

(a) Regulation of all clearances through inter-ministerial standing committee (IMSC).

(b) Reduction in import duty on peripherals.

(c) Liberalisation on the import of computers.

FIGURE: SYSTEM DIAGRAM OF ICHI FOR THE PERIOD 1984-90

(d) Granting permission to foreign equity participation.

(e) Recognising software as a separate industry and formation of a software development agency for the overall growth of this industry

(f) Allowing import of computers by government institutions as well as R and D organisations.

One immediate result of this policy was the reduction in prices of the systems by as much as 25 per cent, as enterprises passed on the duty reductions to customers to gain an edge over competitors.

Subsystem 2 – Computer Technology: During the period technology development was one of the fastest in computer industry Significant developments were – emergence of personal computers as powerful office tool, networking of computers of different manufacturers and processing capacities and workstations for CAD/CAM applications. The technology trend was towards standardisation (from proprietary). IIT Kanpur developed Graphics Indian Script Terminal (GIST) card for using computers in regional languages. The pace of technology was so fast that computers based on a new technology were introduced every three years and product life cycles were less than a year. Barring the US, all the countries acquired the technologies through licensing, collaboration, or by inviting US multinationals. Even in the US the technologies were developed by a large number of severely competitive enterprises. It was impossible for any country to develop the entire range of computer technologies on its own and also keep pace with the developments. There was no single source of all the technologies and the technology was complex, it was imperative for the government to facilitate the access to the technology. NCP provided for freer access to the needed technology and faster clearances. NCP made it possible for Indian

TABLE 1 GROWTH OF INDIAN COMPUTER HARDWARE INDUSTRY, 1983-91

Year	Industry Turnover (Rs in Crore)	Per Cent Growth
1983-84	125	
1984-85	138	10.4
1985-86	234	69.6
1986-87	347	48.3
1987-88	510	47.0
1988-89	674	32.2
1989-90	900	33.5
1990-91	1094	21.6

enterprises to launch computer products of nearly all types after making some adaptations (some enterprises acquired capabilities), and more importantly almost at the time of their worldwide introduction

Subsystem 3 – Human Resource: Shortages of technical/skilled manpower was felt in the industry specially after 1987. This was primarily due to the rapid growth in the requirements of the industry as a result of its expansion catalysed by the provisions of NCP. At university and engineering college levels, a number of new courses such as Masters of Computer Applications, Diploma in Computer Applications, BTech/BE in computers, etc, were introduced. In private sector, computer training centres were started by enterprises such as NIIT, ICE, ICS, etc. Government also started ambitious CLASS project in over 10,000 schools. Further, there was a qualitative shift in the composition of manpower – from earlier pure science (mathematics, statistics, physics, etc) graduates to engineers, MCAs, DCAs and MBAs

Subsystem 4 – Extent and Usage of Computers: Initially when computers entered India, they were primarily used by the scientific organisations for their research and development activities. Slowly the computers started finding their utility in the area of electronic data processing (EDP) in organisations which required handling of huge data, e.g. NSSO, Census, and payrolls in large business enterprises. However, with the entry of PCs in post-1984 period, there was a definite broadening of the scope of computers in an area which till then had not been explored in India – more and more organisations started using computers for wordprocessing activities. This soon graduated into desk top publishing area by 1989-90 on a regular commercial basis. Then came the use of computers in the area of inventory management, on-line transaction processing, etc, which found utility in a number of private/public sector organisations.

This phase also saw a boost given to the process of computerisation by organisations and institutions belonging to the government. National Informatics Centre (NIC) had played a pivotal role during the processing and analysing of Asiad 82 results. During this exercise it had also demonstrated the establishment of a wide area network (WAN) within Delhi using its Cyber 170/730 mainframe system. This period saw the announcement of building up of NICNET (NIC network) through INTELSAT/INSAT satellite up to the district level. Through this project plans were launched for major computerisation drive at the central/state/district level government offices. With NICNET attaining its target of reaching district level by the end of 1989, the problem of working in regional language became a major issue – which was solved by academia of IIT Kanpur. The initiation of computerisation of land records at Morena (MP) and Kanpur (UP) gave another fillip to the process of computerisation in particular and the computer industry at large.

Amongst other major initiatives were the announcement of the launching of computerised railway reservation system; mooting of INDONET, computerisation of passport offices and last but not the least, organisations such as Indian Airlines, ONGC, SAIL, etc, launching schemes of computerising their operations.

NCP acted as a catalyst towards widespread (e.g. CAD, CAM, MIS, project management, etc) application of computers even in organisations which were conventional in their operations (such as engineering construction and manufacturing units). This was due to the availability of a large number of software packages and hardware configurations, along with the approach of computer companies to adopt aggressive marketing techniques. A direct consequence of NCP was to facilitate institutions, laboratories, and large government organisations to import computers. This became easier and faster through the inter ministerial standing committee. One of the biggest outcomes was the establishment of NICNET through NEC-1000 super computers and ND-500 superminis between 1986-89, which facilitated intensive and extensive use of computers in the country.

Subsystem 5 – Indian Computer Hardware Industry. Within India interesting developments started taking place. Items banned on the import list such as dot matrix printers, floppy drives, power supplies, monitors, keyboards, etc, became freely available and some domestic production also started. In spite of this industrial units in private sector were found wanting an issue of a reliable R and D base of their own. They were more eager to develop/produce microprocessor based supermicros and PC-compatibles. Even for doing this they preferred collaborations with prominent foreign manufacturers. In the public sector ECIL tied up with Control Data Corporation (CDC) of the US to produce mainframes and Norsk Data (ND) of Norway for superminis. SCL started producing LSI chips. ET and T was identified to produce low cost high quality electronics products.

There was significant increase in the size of the computer hardware industry, with annual growth rates about 50 per cent during the period (Table 1). In 1984-85 top ten companies accounted for 90 per cent of the industry's turnover. This reduced to about 60 per cent by 1990-91 [Bhatnagar 1991]. There were changes every year with enterprises entering and dropping out from the list of 10 largest enterprises. The competition became increasingly severe due to the entry of a large number of enterprises and overpowering thrust on growth by incumbents. This occurred due to the entry of a large number of enterprises, who could import technology in the form of SKD/CKD kits, as a result of NCP's provisions. Increased competition amongst the players culminated in severe price cuts during late 1985 and late 1988. The price cuts further fuelled rapid expansion of the industry.

Subsystem 6 – Indian Economy: The computer hardware industry grew at a much faster rate in comparison to the overall industrial growth rate of about 8 per cent during 1984-1990 (*Economic Survey 1991-1992*). Globally the computer hardware industry was growing during this period at

the rate of 12-15 per cent [Chopra 1993]. This 'disproportionate' high rate of growth of ICHI was possible due to the strong thrust by the government for computerisation, reduction in cost of computers, and easier availability of hardware options and software solutions as a consequence of NCP. Plan outlay for the department of electronics had been increased about 2 3 times compared to sixth plan outlay In contrast, for steel, petrochemicals, fertilisers, and agriculture the outlay had increased by 37.69, 7 81, 1.6 and 48 8 per cent respectively (*Handbook of Industrial Statistics 1989*) This establishes the concern of the government to give greater impetus to the electronics sector at large, of which ICHI was one component

The new computer policy of November 1984 thus had a significant impact on the evolution of ICHI [Karki and Cameron 1993]. The impact of NCP was essentially in two ways. First, it made possible for ICHI to be latched with the global computer industry by allowing free access to technology and components. Second, it induced and attracted a large number of enterprises in the ICHI fold which led to competition resulting in easier availability of computer solutions at lower costs

Conclusions

India embarked on a wide-ranging initiative to liberalise its economy by reducing controls on entry and operation of enterprises, hesitantly in mid-1980s and quite vigorously since 1991 The initiatives since 1991 are also aimed at globalising Indian economy - removing non-tariff barriers and reducing tariff barriers on import for most of the technologies and products, and freer entry of multinationals. There is a perceptible shift in the role of government from 'doer-controller' to 'facilitator-intervenor' of the industry. Due to change in premise about the role of the government *vis-a-vis* industry, type, magnitude, implementing approach, timing of public policy initiatives is altered Therefore experience of computer hardware industry in which government role was of 'facilitator-intervenor', can hold important lessons in policy initiatives in the future.

The key objective of industry-related policies of the government in liberalised-globalised economic environment is to help develop globally competitive industries. Roots of globally competitive industries are at multiple levels – enterprise, industry, infrastructure, health of social sector, i e, education [Porter 1991]. Government policy would need to help improve these 'roots' for the evolution of globally competitive industries. Being globally competitive is the key objective, as in the emerging world scenario it would be difficult for any industry in any country to "hide behind tariff or non-tariff walls for long".

Some of the key lessons which emerge from system analysis of ICHI, for policy initiatives of the government are.

'Align' policy initiative with corporate strategies and competencies: The New Computer Policy released the potential of private sector enterprises by allowing freer access to technology and components not available in India. Computer technology is complex and very fast developing, so that no single company or nation in the world (barring the US to some extent, but there too, no single enterprise) has been able to keep pace with the technology alone. Government policies before 1984 hindered computer developments and expansion, by insisting on indigenous development. Indian enterprises despite some valiant efforts of ECIL and HCL could never expect to keep pace with world with indigenous developments. It was prohibitively expensive if not impossible Instead Indian private sector enterprises had competencies in supporting the latest technology and products, in developing customised user applications, and in reaching large and small customers throughout the country. NCP was successful as it removed the restrictions and allowed Indian companies to use their competencies to the fullest.

Facilitate domestic competition: NCP allowed freer entry of enterprises into ICHI, and many enterprises could enter as capital requirements were small and skilled managerial resources were available. ICHI had become highly competitive by late 1980s. This led to several advantages: due to tough competition the enterprises increased reach to smaller towns and to smaller customers, bringing about wider availability of computer, while trying to beat competitors enterprises started a race to introduce the latest computers, so that the technology gap rapidly reduced to almost zero by 1990; due to competition the prices in real terms started reducing in real terms, so that by 1990 the difference in price of computers in India and abroad was very small

'Align' with global industrial developments: NCP allowed for alignment of computer technology in India with the world. Technology developments have their own logic depending on invention, availability of markets, etc Global integration is the premise of national economies in future. Long-term benefits to the nation of a government initiative would be significantly dependent on its impact to bring about Indian industry to global levels – in technological sophistication and efficiency.

Consistency with other government policies NCP in some ways had some inconsistencies – with the thrust on indigenous technology, development of technology and industrial policies. But due to extraordinary focus on computerisation led by prime minister Rajiv Gandhi, apparently NCP overrode provisions of other policies. Fortunately the inconsistencies of government policies did not have adverse effect on computer hardware industry. But it can have a crippling effect on some government initiatives.

Focus government efforts on infrastructure creation: As evident from systems analysis evolution of ICHI was strongly aided by the government thrust on computer usage by the departments, investments in INDONET and NIC, spread of computer literacy and establishment of computer training institutions. Such investments could be made only by the government, and which led to development of specialised skills in the country These skills, which are the principal factors of knowledge-based industries, would stand in good stead for future evolution of computer industry in India.

Promote specialised and sustained investments: This has been the weakness of NCP. Computer industry enterprises in general spent little on research and development during 1984-1990 period. Some of the investments which could have been made on creating facilities and skills for internalisation/adaptation of core and peripheral technologies get into the forefront of technology development for some components or processes, faster development of indigenous sources for parts (done on fewer components and for very slowly). Some like Wipro Infotech which made such investments reaped rich rewards, and many others like Pertech Computers Limited realised the need by 1990. But creation of specialised skills by promoting investments by enforcement or incentives should be an important component of policy initiatives, to reap advantages of globalisation after achieving it.

Foreign Collaborations and Industrial R and D in Developing Countries

Case of Indian Automobile Ancillary Industry

P K Chugan

An investigation of the factors related to foreign technology vis-a vis their role in determining the firm s development, adaptation and absorption (DAA) capabilities reveals that while the number of foreign collaboration agreements (FCA) and foreign equity do influence DAA capabilities, the impact is limited; for, other technology transfer related factors restrict the firm's freedom to operate in a manner it deems fit. A comparative analysis of FCA and non-FCA units indicates that in spite of weaker R and D base, the non-FCA units spend more on R and D in relative terms and develop/adapt larger numbers of products than the former

MOST studies in the past have concentrated on an examination of the nature of government research and its utilisation in developing countries. Experience has shown that the extent of government R and D utilised by industry is very small [Desai 1980; Alam 1984], and it is becoming increasingly clear that for any significant improvement in the technological capabilities of Indian firms, R and D will need to be mainly done within the firm [Alam 1988a,148].

The R and D thrust of industrial units in developing countries, however, basically lies with their abilities/capabilities to develop and adapt the product/process and absorb the technology obtained from elsewhere in the shortest possible time[1]. There are, however, a number of factors such as size of a firm, its R and D facilities, its inward or outward looking orientation, its experience through learning by doing, its access to foreign technology and the interest or active involvement of its foreign partners in its R and D activities *vis-a-vis* its access to collaborator's R and D departments, its level of average wages/salaries, its profitability through R and D activities, the nature or technical aspects of the products manufactured, its knowledge about the R and D infrastructure/facilities available outside its own premises, the restrictions and their effectiveness as stipulated in FCAs with respect to modifications/improvements in product design, use of raw materials, machinery and equipment and further transfer of technology, etc, which determines the firm's capabilities, in this regard. The significance of these factors and their impact on development, adaptation and absorption (DAA) capabilities, however, differ from firm to firm because they relate to the specified firms and are firm specific. An earlier regression analysis (OLS) based on the data of 75 units manufacturing automotive components suggest that the size, age, number of foreign collaborations, foreign equity, highly-paid employees, net profit/loss and the manufacturing of critical components etc, influence the firm's DAA capabilities/efforts positively. Size and age variables, however, may not have desired impact on DAA capabilities of small units, because their coefficients though positive, statistically are insignificant. But these co-efficients are significant for the large units and therefore, are expected to influence their DAA capacities positively. Export performance though has a positive impact on the DAA capabilities of small units, the negative significant relation for large units as well as the industry as a whole reveals that the export orientation has rather reduced their capacities[2].

As the purpose of this study is to investigate the factors related to foreign technology *vis-a-vis* their role in determining the firm's DAA capabilities, we restrict our analysis to those factors which are linked with the technology import/transfer. These factors may be categorised as 'common factors', viz, the factors that are relevant for both units in the foreign collaboration agreement (FCA) and without foreign collaboration agreement (non-FCA) and the 'technology transfer related factors' which relate to the FCA units only. While the common factors provide a comparative picture with respect to different factors in the group of FCA and non-FCA units, the technology-specific factors directly highlight the role of foreign technology-related factors in determining the DAA capabilities of FCA units. We start our analysis with the 'common factors' which will be followed by 'technology-specific factors'.

Common Factors

As mentioned above these factors are common for FCA and non-FCA units, and are, therefore, a good source of information for the inter-firm comparisons in respect of variables such as R and D expenditure, no of samples developed/adapted, the awareness of R and D related institutional infrastructure and its activities including manpower, the designation/position of R and D chief, the ratio of imported equipment/machinery to indigenous equipment/machinery in R and D, etc. Analysis of these variables, for the FCA and non-FCA units is being attempted in the following paras.

R and D Expenditure

The data on R and D expenditure for both the groups of units are shown in Table 1.

We may notice from the above data that FCA units, in absolute terms spend more on R and D activities than the non-FCA units. The largest expenditure amongst the units of study has been found Rs 170 lakh in FCA group and Rs 80 lakh in non FCA group. The average absolute expenditure has been Rs 32 lakh and Rs 15 lakh by FCA and non-FCA groups respectively. The lowest spending in FCA units is Rs 0.50 lakhs and that for non-FCA units is Rs 5,000. The R and D spending in relative terms, e g, as a ratio of sales turnover, however, has been found higher in non-FCA units than the FCA units both in small as well as in medium/large units. The average spending on R and D (per cent to sales) is nearly 1 per cent (0.96) in non-FCA units as against 0.73 per cent of FCA units.

It, thus, appears that the FCA units have more resources at their disposal for R and D, in absolute terms, but their spending is less as a ratio of sales turn over than those of non-FCA units. We, however cannot rely on the R and D spending alone, because these data do not capture the other form of technological activities such as production engineering, learning by doing, quality control, troubleshooting, miscellaneous marginal/incremental efforts, etc, of small units.[3] Moreover, these figures are expected to be inflated as they are shown in the accounts for obtaining tax exemption benefits offered by the government.

Product Development/Adaptation

We may observe from the Table 2, that the credit of developing/adapting the maximum number of samples goes to non-FCA units. In the given period, these units developed/adapted 306 samples, i e, on an average six samples per unit. The largest number of samples developed/adapted by any single unit in this group is 25 and the lowest is nil. The FCA units on the other hand developed 132 samples, i e, on an average four samples by a unit with a maximum 20 and minimum two samples.

The inter-firm comparison with respect to product development/adaptation work of FCA and non-FCA units indicates the better performance of the latter group This, however, cannot be taken as conclusion, because the number of samples developed/adapted alone do not reflect the actual DAA performance as they do not highlight the quality and the value of work performed. A small unit may have developed a number of small and simple or non critical samples more frequently and quickly while the other unit may require a longer period and more resources for developing only one or a few difficult or critical samples.

R and D Facilities/Infrastructure

The data on in-house R and D facilities such as an independent R and D section, average number of personnel, position of the chief and the availability of indigenous or imported equipment are given in Table 3.

R and D Sections

Almost each unit in FCA group has a formal R and D section or atleast an independent quality control department In the non-FCA group, however, only 37 units, i e, 72.55 per cent had an independent R and D. For both the groups, almost every unit has a quality control department/inspection section/product performance centre, etc, as a part of their R and D sections which are under the supervision of the R and D chief.

R and D Personnel

The number of R and D personnel in absolute terms as well as a ratio to total employees has been found higher in FCA units than the non-FCA units. In FCA units, on an average, there are 29 R and D employees as against only 14 employees in non-FCA units. Similarly more than three persons over 100 workers are employed in FCA units than those of more than one in non-FCA units. One of the main reasons of low ratio in non-FCA units is because of their small size, they depend upon others for their R and D requirements so as to meet their adhoc nature of development/adaptation work.

Status of R and D Chief

As per Gumaste (1988:82) the status of R and D chief in corporate hierarchy of a unit has an impact on the quality of R and D work done. If a fairly high status is accorded to him, his ego is satisfied and this has an impact on R and D work. Also when R and D chief has a reasonably high status, the communication between him and his unit and the No 1 of the concern, and interface with the rest of the departments in the concern improves vastly. Since optimum flow of management information has an important bearing on the health and growth of the firm, good communication between the chief of R and D and the heads of different departments would greatly affect the financial fortunes of the firm, particularly in the long run. On the other hand, if R and D is considered to be of mere decorative or cosmetic value (mostly to gain a number of fiscal and other concessions) to the unit, the R and D chief would be obviously a low ranking man. It follows that if a unit wants to take up R and D with seriousness and wants to contribute to the unit's growth, then it will accord a fairly senior position to the R and D chief.

The status for R and D chiefs in the FCA units were better than in the non-FCA units. Over 21 per cent units in this group accorded second position to the R and D chief and over 30 per cent the third position These percentages for non-FCA units stood at about 10 per cent and 21 per cent respectively. In the units where R and D chief occupied second positions, they report directly to the head of the units generally the chairman or managing director. There are, however, at least one or two more positions (channels) to be reported, where R and D chief occupied 'the position' at third or fourth level

The status of R and D chiefs in the units under study have been found almost at the same levels as in the findings of Gumaste (1988:82) and do not differ even with those observed in developed countries. In Gumaste's words, the status of R and D persons in advanced countries such as the US and the UK is much the same as in India. Waliff (1979) and Gunz (1980) speaking on the status of R and D persons in the US and the UK bemoan the same 'low status' and 'second-class-citizenship' in those countries as well. The position of R and D chief, however, reveals a firm's responsiveness, awareness and its attitude towards the technological dynamism and the position of R and D chiefs in our study is found better in FCA units than those of non-FCA units. We, therefore, expect these units to exhibit a comparatively rich technological dynamism leading to quick development adaptation and absorption work

Availability of Imported R and D Equipment

Arguments are advanced for use of the imported equipment for their better quality and accuracy etc. These equipment, in general, are preferred to indigenous equipment available in developing countries.[1] The ratios of foreign made machinery and equipment to the indigenous machinery and equipment, therefore, have been worked out for both the FCA and non-FCA units, as given in Table 3.

All units of the study have at least some proportion of indigenous machinery/equipment. The ratio of imported indigenous equipment and machinery, however, has been found higher in FCA units than the non-FCA units. In FCA group, nearly 9 per cent units have 80 per cent imported equipment as against no unit in the non-FCA group. On the other hand, there are over 37 per cent units in non-FCA group that reported 100 per cent indigenous equipment as against no unit in FCA group. Between these two ranges, the 50:50 ratio of foreign equipment to indigenous equipment has been reported by 15 per cent and 6 per cent units in FCA and non-FCA groups respectively. In FCA group 13 units of over 39 per cent, have foreign equipment more than 50 per cent as against only four units, i e, 7.84 per cent of non-FCA group. The comparative observations, thus clearly highlight that the FCA units having higher proportions of imported R and D equipment than the non-FCA units and therefore appears to be more quality/accuracy conscious of their DAA work.

TABLE 1. R AND D EXPENDITURE IN FCA AND NON-FCA UNITS

Rs Lakh

R and D Expenditure	FCA Units	Non-FCA Units
Maximum	170.00	80.00
Minimum	0.50	0.05
Average	32.00	15.00

Average (small units)	2	4
Average (medium/large units)	4	3

Awareness of Institutional R and D Support

Besides, a firm's own R and D efforts and the available in-house R and D infrastructure including manpower and equipment, its knowledge/awareness about the institutional R and D facilities in a particular region and country is equally important. The services provided by the various R and D institutions are not firm specific, but generally, are available to all the units on the uniform terms and conditions, payment etc, and it is the unit in question that has to avail their services as per its knowledge/awareness about them. We, therefore, attempted by putting even the very direct question to the representatives interviewed about their awareness of such R and D institutional set-ups at national, state and district level. The relevant data on this field of information are shown in the Table 4.

It is evident from the Table that about 82 per cent units in FCA group are fully aware and remaining 18 per cent are partly aware of the R and D institutions relevant to their product range. In the non FCA group the corresponding percentages are 70.59 and 29.41 respectively. The awareness at the state or district level is even more in both the groups, but here again the FCA units are more aware than the non-FCA units. The utilisation of their services, however, has not been reported widely. Particularly in FCA group only 33.33 per cent units reported to have utilised their services at least once or twice. The limited utilisation of their services by FCA units is attributed mainly to delayed and unsatisfactory results. Moreover, these units preferred, in general, to make use of their own in-house R and D sources even by acquiring the additional/new equipment either from abroad or locally if available. The representatives informed that the in-house R and D suits them more as their R and D activities are primarily directed towards the adaptation, absorption and development related jobs which can be carried out more speedily and fruitfully in their own premises.

Small, non-FCA units, which in general have weaker R and D base, however, have been utilising the services of institutional set ups more frequently. Some SSI units even do not have their own well developed tool rooms and for their tooling needs very often go for these services. Therefore the need for setting up the well organised commercial tool rooms for manufacturing various types of dies, moulds, jigs and fixtures, etc, has been justified by the industry representatives in a private sector so as to get better and quick results.

While commenting on the services of institutions (Table 4), over 54 per cent units in FCA group and 40 per cent units in non-FCA group described them as not satisfactory. Two FCA units, i e over 18 per cent called them good for some specific needs only and for the remaining three FCA u[illegible] per cent these were just satisfactory. In non-FCA units, 60 per cent units described these services either satisfactory (36.67 per cent) or good (16.66 per cent) or very good (6.67 per cent). It is thus evident from the data as analysed in Table 4 that the non-FCA units have availed the services of R and D institutions more fruitfully though there is a considerable scope to improve their services. They need to be strengthened further. Moreover, there is a great need to set up sophisticated commercial tool rooms in private sector.

Thus, the above analysis of common factors related to R and D base and efforts with respect to FCA and non-FCA units highlights that the R and D expenditure in absolute terms, R and D base in terms of independent R and D/quality control departments; average manpower both in absolute terms as well as a percentage of total employees; status of R and D chiefs, ratio of foreign equipment to indigenous equipment for R and D purpose, general awareness of R and D institutions, etc, is higher/better in FCA units than those of non-FCA units. On the other hand non-FCA units incur more R and D expenditure in relative terms, i e, as a percentage of their total sales, generally use higher proportions of indigenous equipment in R and D and utilise more services of R and D institutions/organisations. In spite of having a comparatively weaker R and D base; non FCA units on an average develop/adapt more product (in numbers) than the FCA units.

Since, the quality of R and D work done is not reflected by the above analysis, any firm comment on the comparative performance of FCA and non-FCA units may be misleading until further analysis with respect to qualitative *vis-a-vis* quantitative data is carried out. We now attempt to analyse the variables which are related to FCA units.

Foreign Technology Specific Factors

Leaving aside the non-FCA units, we now analyse the factors that are directly related to foreign technology and affect the FCA unit's R and D performance and behaviour. These factors may be grouped as quantifiable factors and qualitative factors. To begin with, we analyse the quantifiable factors.

Quantifiable Factors

(i) *Number of Foreign Collaboration Agreements (FCAs).* It is a proxy to the extent of knowledge imported and represents in general, the assimilation and diversification capacities of the units of the study.

(ii) *Foreign Equity Participation (FE).* This variable represents the equity participation or share of the technology supplier and the active involvement of technology supplier in day to day operation of the plant as well as its future growth either directly or indirectly affecting firm's R and D behaviour and absorption capacities. It influences the willingness of technology supplier to undertake adaptation to the local needs through its own or its affiliate's technological capacities, managerial skills, R and D resources, etc, and be instrumental in promoting DAA of local enterprise. Caves (1982: 196) writes that just as R and D promotes foreign investment it is possible that foreign investment promotes R and D.

These two factors have been used as the explanatory variables and their statistical relationship with R and D expenditure has been tested statistically. We hypothesise the following relations, here first

Table 3 In-House R and D Facilities in FCA and Non FCA Units

R and D Facilities		FCA Units	Non-FCA Units
a Indpendent R and D Section	Nos	33	37
b Average No of R and D personnels	Nos	29	14
c Ratio of R and D personnels and total employees	Per Cent	3.17	1.67

(vii)	All IE	nil	19 (37.25)

Hypothesis

(i) *Number of Foreign Collaboration Agreements (FCAs)*: We expect its positive relationship with R and D because:

- the foreign collaboration and technology transfer in general, is a source of various inputs that determines the R and D behaviour of a local firm. The greater the number of licences the firm attracted the more it is diversified and with the greater degree of experience gained through assimilating and adapting the number of technologies, able to develop and adapt new/improved products more quickly and efficiently.
- the experience gained through many technologies enables it to bargain better terms for R and D in the subsequent transfers of technology thereby increasing the absorption capacity of that firm. In other words, increased mastery resulted from the use of previously established technologies contributes to firm's capacity for undertaking higher R and D activities. Alam (1988:25-26) writes that in the Indian context there is some indication that with increase in the experience and technological competence of the Indian firms over time the incidence and extent of adoption of imported technology has increased. Firms who went for their first collaboration in the late 1950s and the early 1960s were reportedly not competent to modify the imported technology. However, in their collaborations in the later years (especially since the 1970s) they were able to introduce important adaptations.

There are, however, some arguments in the literature against the above hypothesis and the relationship may also be found either negative or insignificant. For illustration the greater exposure to the number of technologies may not necessarily lead to the greater technological mastery and benefit the R and D of an enterprise. Much depends upon the terms and conditions and the actual application of the restrictive practices.[6] Subrahmanian's (1972) and Mann's (1982) studies report the clauses in FCAs restricting the technology importers to modify/improve the original design or specifications.

Solo (1966) distinguished three levels with regard to local adaptation. The imported equipment and process designed and applied in the context of developed country's environment require on the spot adjustment to suit the local conditions. This is the first level of adaptation. An equipment and technique embodies a corpus of knowledge. The mastery of that knowledge and its use in designing new mechanism and technique must appropriate to solve the local problem is the second level of adaptation. The third level of adaptation is the basic research to produce further knowledge and mastery of problem solving and information producing apparatus. It means adaptation of advanced technology's very mechanisms for adaptation and further advance. Kumar (1985) writes that the practice of restrictive clauses prevents local adaptation of the first and second levels and retards assimilation of imported know-how. Moreover, the reluctance of technology suppliers to impart the needed and necessary inputs, assistance and technical know-why aspects for the efficient adaptation and assimilation has been a determinental factor, which dilutes our hypothesis. The available evidence[7] indicates that the technology suppliers have shown little interest in building up the efficient R and Ds of their counterparts for an effective and speedy absorption.

Further the technology suppliers have strong preferences for locating such facilities at home or in other developed countries and for concentrating on the kinds of product and process appropriate to their own needs rather than to developing countries [Deo 1986: 52]. The evidence [Gelrmidis 1977, UN 1973, OECD 1981] indicates that MNCs generally locate their research work in their home countries, less in other developed capitalist world and almost nothing in the under developed countries. As per Kumar (1991: 383), other things being the same firms following non-price rivalry (MNEs) are expected to spend more on R and D activity. While this may be true of global operations of MNEs compared to purely national firms, it may not be the case with individual MNE affiliates and their local counterparts. This is because MNEs tend to concentrate most of their R and D activity near their headquarters, given its strategic importance for their global operations.

(ii) *Foreign Equity (FE)*: We expect positive relationship between foreign equity and R and D because

- Foreign collaborators are expected to involve themselves more if their profitability from the project is linked on a long-term basis. Balasubramanyam (1973.25) writes that it is conceivable that the technical involvement of the foreign firm is relatively higher when they have a stake in the profitability of the operations. If the intentions of foreign firms were to reinvest their profits and increase their holdings in the local firms, their concern about the success of the venture would be greater.
- The rich managerial skill, a comparatively larger size, ability of bearing higher risks, sophisticated equipment and latest and updated technological base with the collaborator's support is expected to induce the firms to undertake more adaptations to the local conditions. Lall (1983: 381-383) finds the positive effect of foreign equity on R and D and writes that the foreign management may be more responsive to technical opportunities than local and concludes that the foreign ownership promotes R and D. Caves (1982.196) also writes that just as R and D promotes foreign investment it is possible that the foreign investment promotes R and D.

Likewise the number of FCAs, there are also reasons which may either invalidate or dilute our hypothesis of foreign equity participation because some of the available evidence[8] suggests that the foreign controlled firms were less concerned about the adaptation and absorption than their local counterparts. In Kumar's words (1989:4) there may be several compelling reasons for a local firm to undertake R and D. For instance unlike MNEs a local firm does not enjoy the continuous access to laboratories of the parent firm abroad. The local firm which obtains technology from abroad on licensing basis may be forced to undertake

TABLE 4 AWARENESS OF INSTITUTIONAL R AND D SUPPORT

(c) Good	2	(18.18)	5	(16.66)
(d) Satisfactory	3	(27.27)	11	(36.67)
(e) Not satisfactory	6	(54.54)	12	(40.00)

R and D to absorb, adapt and modernise the technology. The fixed life span (usually five to seven years) of FTCs and restrictions placed by the Indian government on their renewals may make the licensees anxious to absorb the technology during the life of collaboration agreement. Hence, the local firm could exhibit a tendency to spend a greater proportion of their income on R and D than their foreign affiliated counterparts. Foreign affiliates or controlled firms however, are not dependent upon their parent companies for the inflow of latest development and their R and D activity generally confines only to minor product modifications, raw material substitution, etc.

The evidences gathered by Kumar (1985) indicate that the contribution of technology imports to the local technological capability building has been rather limited. The limiting factors have been the reluctance on the part of the foreign technology suppliers to part with the capabilities required for efficient adaptation and absorption, by restricting the ability of the technology importers to make independent technology choices, blocking the way of horizontal diffusion and assimilation and absorption of the imported technologies, by neglecting the R and D activity and sometimes even by actively hindering the innovative activity of local firm. Of the modes of technology imports, foreign direct investment (FDI) seems to be a less efficient way of import of local technological capability building because foreign ownership and control perpetuates the dependence of the local enterprise on foreign sources and discourages the autonomous technological capability building. Kumar (1987:231) found the FDI negatively associated with R and D intensity.

In spite of some evidence contradicting our hypothesis in respect of number of FCAs as well as for foreign equity participation, as cited above, we expect our hypothesis to come up as expected, because an earlier regression analysis on determinants of technological development, based on the data collected for the present study (with 75 observations of 26 FCA and 49 non-FCA units) has given the expected results [for details see Chugan 1991a; 1993a]. The statistical exercise which follows is confined to the above two variables only, with the larger observations of a size of 33 FCA units.

$$\dot{Y} = f(FCAs, FE)$$

where, Y = Formal R and D expenditure deflated by sales

FCA = Number of FCAs

FE = Foreign Equity participation

$$Y = -1.013 + 0.521\ FCA \quad (1.819) \quad + 0.139\ FE \quad (1.699)$$

$$N = 33\ R^2 = 0.20,\ \bar{R}^2 = 0.15,\ F = 3.38$$

The coefficients for both the explanatory variables are positive and significant (at 5 per cent) but value of $R^2/\bar{R}^2$ is considerably low. The value of F is significant at 5 per cent level. This means not more than 15-20 per cent variations in R and D are as a result of foreign technology. The remaining 80-85 per cent variations are caused by the other factors which determine a firm's R and D capabilities. The statistical exercise thus reveals positive but rather very weak impact of foreign technology on the firm's R and D building capacities.

Qualitative Factors

The information on qualitative factors has been obtained and analysed in respect of six questions as shown in Table 5.

Access to Collaborators' R and D Facilities

The first qualitative factor affecting a firm's DAA capabilities could be related to its access to R and D sections/departments of its foreign (parent) counterparts. As per Mann (1982:96), technology suppliers, so far, have been so conscious of the paramount need for maintaining secrecy that they did not easily impart the necessary training to the Indian personnel. They conducted themselves in a very cautious manner and denied facilities to their Indian counterparts to become familiar with the intricate machinery they operated. Normally, this policy of their was implied in their collaboration agreements. While analysing the contents of FCAs with West Germany, France, Italy, Denmark and Japan, Desai (1988:423) states that technicians visit to India were not embodied in half of the agreements, and Indian technicians visit to technology suppliers were similarly included in only half of the agreements. Access to laboratories and design offices was not provided for in half the agreements [also see Desai 1988a:23]. In FCAs group 18 units of the present study, i.e. 54.55 per cent FCA units said to have seen the R and D departments of their collaborators and some of their engineers

TABLE 5: QUALITATIVE FACTORS AFFECTING THE R AND D CAPABILITIES

Factors		Responses	
		No of Units	Percentages
(i)	Access to collaborator's R and D departments/section/activity		
	Yes	18	54.55
	No	15	45.45
	Total	33	100.00

* More than one type of assistance received by the 24 units who were assisted by their collaborators

IDBI ASSURANCE. ANYWAY YOU LOOK AT IT!

Every month.
Every quarter.
All at the beginning.
All at maturity.

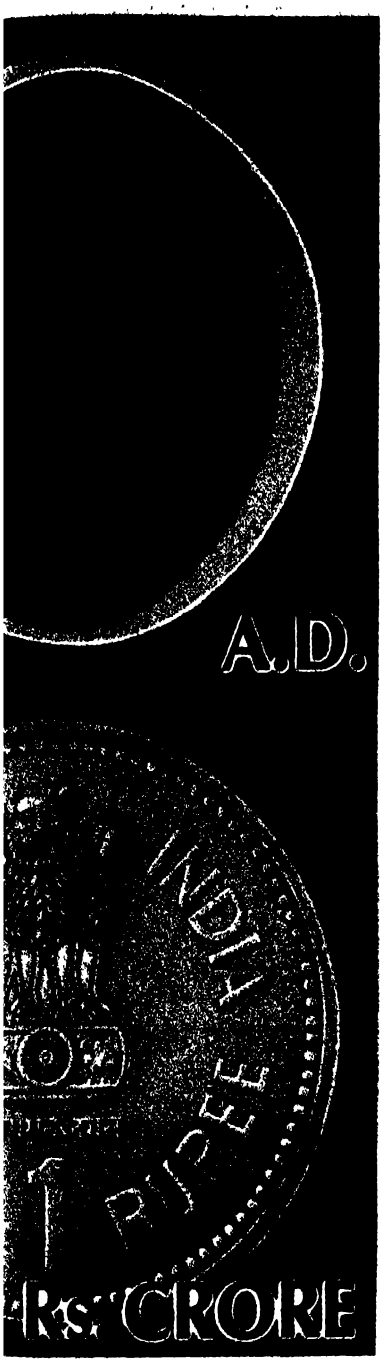
YOUR FOUR-WAY OPTION WITH IDBI'S FIXED DEPOSIT SCHEME*

TYPE	MINIMUM DEPOSIT	YIELD STRUCTURE
Monthly Income Option	Rs.18,000	Rs.195 every month on a 5 year deposit of Rs.18,000.
Quarterly Income Option	Rs.10,000	Rs.325 every quarter on a 5 year deposit of Rs.10,000.
Lumpsum Discounted Interest	Rs.10,000	You will get Rs.4,572 immediately on a 5 year deposit of Rs.10,000.
Cumulative Option	Rs.10,000	A Rs.10,000 deposit becomes Rs.18,958 in 5 years.

**Interest upto Rs.13,000 on the above deposits is tax-exempt under Section 80L of the Income Tax Act, 1961.*

MINIMUM DEPOSIT: Rs.10,000

Beyond the minimum amount, you can deposit in multiples of Rs.1,000. The base interest rate for a three year deposit is 12.5%. And a deposit period of five years and more fetches a base rate of 13%. What's more this deposit comes with the guarantee of India's premier development bank - IDBI. Reflected in the FAAA rating by CRISIL given to this product indicating the highest degree of safety. Naturally, an organisation that has total assets of over Rs.36,000 crores can take very good care of your investment. For more details contact your nearest IDBI office or any authorised IDBI agent.



This opportunity is open to: * Resident Individuals * Hindu Undivided Families * Partnership Firms * Companies/Bodies Corporate/Societies * Trusts/ Association of Persons.

FIRE / MARINE / MOTOR / MEDICLAIM / HOUSEHOLDER'S POLICY / INDUSTRIAL / RURAL INSURANCE

We want to match the turn of the century with our turnover.

We took insurance to the high seas.

We brought it to the grassroots.

We established a hotline to better service.

Strengthening it with highly trained personnel, tuned to the customer's specific needs.

At nearly 1200 offices, countrywide.

For industrial, traditional, commercial, financial, household and rural sectors.

Meanwhile, our premium income leaped twenty-five fold to about Rs. 1300 crore.

All in a space of 24 years.

What better way to greet the new century, than with a performance to equal it...

Like, a targetted premium income of Rs. 2000 crore in 2000 A.D.

United India Insurance. Meeting the challenges of a new century.

UNITED INDIA INSURANCE CO. LTD.
24, Whites Road, Madras-600 014

CANCOUN/1/95

MAKE ME PROMISES, ASHOK LEYLAND

We're concerned about the earth our children will inherit. That's why we make sure our vehicles consume less, pollute less...

Did you know that Ashok Leyland's new vehicles will meet EEC emission standards?

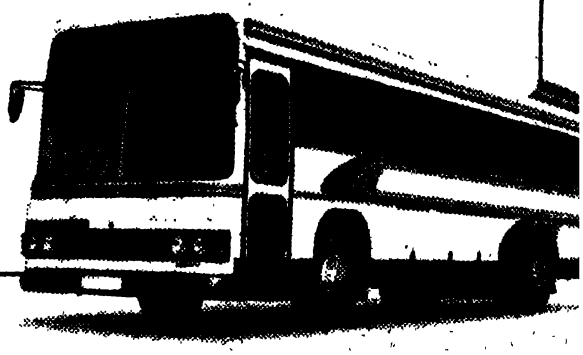
That's because we offer the world's best engine technology. From IVECO of Italy and Hino Motors of Japan. Giving you vehicles conforming to emission norms.

A large number of our vehicles cross the five lakh kilometre mark without any major overhaul. While stretching fuel to the maximum.

And the road ahead?

We see exciting global markets, demanding global standards.

A 13,000 strong team with a Rs.1,500 crore turnover - all geared to win.



Our tie-up with IVECO, a fully-owned subsidiary of Fiat, to manufacture the futuristic Cargo series of world class trucks at our state-of-the-art plant at Hosur, pitches us in the big league.

And so we accelerate. Towards 2000 A.D...

Ashok Leyland

GLOBAL STANDARDS. GLOBAL MARKETS.

HINDUJA GROUP

nd got training there. Their visits/trainings, however, have been generally for short durations. Moreover, the engineers/technicians were not given the necessary exposure of their R and D mechanism. They were rather explained about the use of equipment supplied, etc., and were not allowed to do any experiments or handle the key aspects of technology.

When asked about the opinion of Indian (local) in-house R and D sections, 11 representatives (33.33 per cent) considered them as partly substitute, five representatives (15.15 per cent) called them not at all comparable because of the limited and obsolete equipment. Two representatives (6.06 per cent) considered their own in-house R and D just sufficient or manageable for the current development/adaptive jobs and desired to be equipped with latest equipment so as to get the more quick and accurate results.

Development Adaptation and Absorption: Restrictions

Product/process development work in FCA units is also affected by the technology suppliers through regulatory clauses. Subrahmanian (1972) mentioned that a substantial proportion of the collaboration studied incorporated a clause restricting the freedom of the borrowing company to change the original designs and specifications. These restrictions, according to Kumar (1985) and Subrahmanian (1972) have far-reaching implications from the national viewpoint Kumar (1985) states, it is an important part of the social cost of foreign technology, because very often process/product specifications supplied under foreign collaboration may not suit to the local conditions in terms of local availability of material, etc. and hence adaptation becomes necessary. Further, during the process of adaptation a more effective assimilation of technology may take place. Restrictions on changes in original specifications may make substitution of imported raw materials by local ones difficult, leading to continued dependence on import." Hence, the tendency on the part of technology suppliers to restrict the adaptation is an important social cost of technology import.

In the absence of freedom to change design, the Indian venture is constrained to follow the material specifications and standards of foreign collaborators. This hinders the progress in standardisation and variety reduction movement in the Indian industry on which depends a major part of industrial productivity and efficiency [Subrahmanian 1972:151]. These clauses of restricting the design/specification changes also have a motivation of pushing the maximum import of raw materials, equipment, machinery, services of their engineers, etc. in the local markets. Referring to these clauses, Subrahmanian (1972:151) states that it is the same motive which makes the collaborator compel the Indian venture to incorporate changes in specifications as being desired by the foreign collaborator, their desirability to Indian conditions disregarding. The restrictions therefore, impose a built-in condition to import material, spares and components from foreign collaborators, with the result that the domestic manufacture is made highly import dependent and import substitution is thus made less efficient. Moreover, in the words of Balasubramanyam (1973:82) when the Indian firm is constrained by the agreement to buy the equipment and the materials from the knowledge-supplying firm it is possible for the supplying firm to charge monopolistic prices.[10]

In the present study of 33 FCA units, the five units, i e. 15.5 per cent admitted to having the direct restrictions in FCAs that prohibited modifications/improvements in the product design. Amongst these five units, three units, i e, 9.09 per cent said that for any change in product design the prior permission of collaborator is necessary and in the remaining two units, i e, 6.06 per cent, one said that a separate agreement is to be signed for changes in design and the collaborator's permission is necessary. The other said, if the product is for export, the collaborator's permission is essential. In spite of restrictive clauses, a few units admitted that to improve the productivity, efficiency, smooth running of plant *vis-a-vis* the changing requirements of the local market the product modifications have been made by their own engineers/technicians who are capable of doing the same without any expensive foreign assistance.[11]

Product Development/Adaptation: Assistance

As the various restrictive clauses in the FCAs retard the process of assimilation of imported know-how and limit the scope and pace of product as well as the process development and adaptation, the industry representatives were asked about the assistance they received from their collaborators for developing/adapting new items.

Out of 33, 24 units or 72.33 per cent admitted that they had received some assistance from their collaborators for developing or adapting new components. The nature of the assistance (Table 5) was either getting the samples or drawings/designs or both; testing in the collaborator's R and D section by their own engineers, etc. These 24 units, in all, received 69 services from their collaborators. The maximum number 24 or 34.78 per cent goes for getting designs/drawings followed by 20 (28.99 per cent) for getting the samples and 15 (21.74 per cent) for getting the samples tested in collaborator's R and D sections. The other assistance i e, 14.49 per cent included guidance of foreign experts, supply of specified tools or dies for developing (copying) the components, etc.

Tied-up Purchases: Restrictions

One of the motives of technology suppliers in prohibiting the change/improvement in original design by the technology importer is to push the maximum amount of raw materials, equipment, machinery, etc. to the local market and for this purpose the various clauses in respect of supply of machinery, equipment, raw materials, etc, are included in FCAs. The analysis of such restrictive clauses as revealed in the units of this study is shown in Table 6.

As is evident from Table 6, the 23 units or 69 69 per cent admitted of having direct restriction in their FCAs. The remaining 10 units also had some kind of understanding with their collaborators for import of either equipment, machinery, spares or materials to be used in production process. The representatives were of the opinion that as

TABLE 6 RESTRICTIONS ON SUPPLY OF RAW MATERIALS, MACHINERY, EQUIPMENT, SPARE, ETC., IN FCAS

Restrictions		Responses	
		Nos	Percentages
Restrictions on supply of raw materials, machinery equipment, etc			
(a)	Yes	23	69.69
(b)	No	10	30.30
	Total	33	100.00
Type of restrictions			
(i)	Raw materials/machinery, etc, is to be imported only from the collaborator		24.24
(ii)	Raw materials/machinery, etc, is to be imported only from the subsidiaries of collaborator or any other source as directed by him		18.18
(iii)	After the terms of agreement, import of raw material/machinery is permitted from any other sources		6.06
(iv)	Import of raw materials/machinery is permitted with prior permission of collaborator		15.15
(v)	Import of raw materials/machinery is permitted subject to some other conditions laid down in agreements	2	6.06
	Total	23	69.69

the specific machinery and material was necessary for a particular production process, at least in the beginning they had to import it either directly from the collaborators or as per their advised sources. This situation is almost the same as Balasubramanyam (1973:76) reports that because of exacting specifications the foreign technology dictates and the lag in establishing local sources of supply that can meet these demands, import of equipment and components is inevitable at least in the initial stages of a technology transplant. Further, purchases of equipment from the knowledge exporting firm may be pre-requisite for gaining the technology information and knowledge it possesses. The followup services, the manufacturer's manuals and technical assistance that go with the machinery may be vital pieces of technical knowledge.

Amongst the 70 per cent units of our study with such type of restrictions over 24 per cent had the clauses for importing the machinery/equipment and materials from their collaborators. Another 18 per cent units had clauses for importing such materials/equipment from their subsidiaries or from their specified sources. The 6 per cent units were bound to import their requirement from the collaborators during the duration of agreement, but were free to import from any source thereafter. 15 per cent units said that, after their initial requirement, they needed the collaborator's permission for importing from other sources and the 6 per cent reported that the imports from other sources were permitted by collaborators if not more than a specified amount is imported and if prices from the other alternatives are considerably lower. These matters are generally discussed with the collaborators and only then the imports are made so as to keep the relations healthy.

Diffusion of Transferred Technology: Restrictions

The clauses restricting further transfer of technology generally included for ensuring the secrecy of know-how indeed affect the industrial development and retards the healthy growth of R and D in the host country. As horizontal transfer is prohibited, by these clauses, the similar technology is imported by many individual firms from different sources. Mann (1982:25) writes that horizontal transfer of technology within the country is inhibited, so much so that even the National Research and Development Corporation (NRDC) has not been able to do much in this direction [NRDC 1977-78:59]. As a result, there is a multiplicity of collaboration agreements. Every new entrant in a particular field of production is obliged to seek foreign collaboration afresh in his bid to compete with those who are already operating under collaboration agreement. The new entrant is obliged to accept stricter conditions – a fact which means a higher cost of production.

In our country, there is considerable evidence showing that the technology suppliers, through these clauses have restricted the horizontal diffusion. Subrahmanian (1972:144-49) reports 84 out of 130 or about 64.6 per cent FCAs with such clauses by virtue of which the Indian ventures are to keep in secrecy all technical information and not to transfer, assign or sub-license the right to know-how to any third party. While commenting on the implications of these secrecy clauses Subrahmanian (1972:148) states that as the Indian venture cannot transfer, assign or sub-license the know-how to a third party. It means that the imported know-how gets blocked with the importer and cannot be diffused to a third party even at a price. The consequence is that new entrants into the industry cannot avail of the know-how already available within the country and that every new entrant is thus made to seek for separate fresh collaboration agreement entailing duplicate payment in foreign exchange for importing the same or similar know-how. It thus accentuates the phenomenon of collaboration multiplicity with all its deleterious effect on the economy.

The RBI Survey (1974:74) reports about 70 per cent collaboration agreements signed by private companies with such clauses that prohibited horizontal transfer of technology. Kumar (1985) states that the high incidence of such restrictive clauses is in spite of the government's insistence that the importer should be free to sub-license the technology. The evidence of multiple collaborations signed for same products as reported in IIPIC (1969) and Subrahmanian (1972) is a reflection of the lack of diffusion of technology imported by one firm. The technology transfer in such conditions remains a closely guarded secret and hence can at best be termed as a private transfer and not a national transfer thus leading to multiple imports. Citing the example of quartz watches Kumar (1985) further writes that even public sector companies importing a technology find it difficult to sub-license it to another public sector concern. Therefore, the diffusion of imported technologies is made difficult, sometimes even ill by the restrictions imposed by the technology suppliers.

The analysis of 33 FCA units of present study (Table 7) too reveals the presence of such restrictive clauses of either one type or of another, by almost every unit. It means that the horizontal transfer has been, almost completely, restricted or prohibited. The conditional transfers, however, have been permitted which in reality are not considered favourably by the technology importers themselves as they are not keen on sharing/transferring their know-how to others, so as to reap the long-term advantages of foreign technology to the maximum extent possible.

It may be observed from Table 7 that as many as 30 units, i.e. 91 per cent admitted of having a clause of one type or of other restricting the horizontal diffusion of the imported technology.

Amongst these 30 units, 24.24 per cent admitted of having a clause in their FCAs on not transferring the technology to any third party during the period of collaboration and even after the expiry of FCA duration, they are to take the permission of their collaborators. Another 36.36 per cent units said that only conditional transfers are possible, which means the collaborator's permission, duration of agreement, payment to collaborators, only part of the know-how such as machinery or equipment with the approval of collaborators, etc. are to be considered and depending upon the merits and the benefits to the collaborators such transfers in a limited way could be possible. The evidence[12] and the enquiries of the present study, however, reveal that in practice/reality rarely were there cases where such transfers took place.

Conclusion

The above investigation of factors related to FCA units thus reveals that though both the foreign equity and number of foreign collaboration agreements have some positive impact on the firm's DAA capabilities the impact is rather weak and limited. The limited impact could be attributed partly to the other technology transfer related factors restricting the

Table 7: Clauses on Horizontal Diffusion of Technology

Clause	Responses	
	Nos	Percentages
Restrictions on horizontal transfer of technology		
(a) Yes	30	90.90
(b) No	3	9.10
Total	33	100.00
Type of Restriction/Clauses		
(i) Total restrictions	8	24.24
(ii) Technical information can be transferred/disclosed with the prior permission of the collaborator	12	36.36
(iii) Technical information can be transferred/disclosed subject to some other conditions laid down in the agreement	10	30.30
Total	30	90.90

firm's freedom to operate in a manner it deems fit by the clauses in their FCAs such as we have discussed above, viz. restrictions on modifications/improvements in product design, restrictions of tied-up purchases, restrictions on horizontal diffusion of technology, etc. and partly to the limited/restricted assistance provided by their collaborators for the desired level of R and D work and technology absorption. Moreover, the other factors such as the size of units, the number of highly paid employees, profitability of the venture, nature of items being manufactured, level of wages and salaries, experience of concerned units in related production line, etc, are also some factors which could determine the technological capabilities of an enterprise and therefore, are equally important determinants besides the foreign technology.

The comparative analysis of FCA and non-FCA units, however, indicates that in spite of weaker R and D base, the non-FCA units in relative terms spend on R and D and develop/adapt larger number of products than the FCA units.

As the non-FCA units in the present study are mostly small in size and if we ignore the role of foreign technology for the moment, we find small units perform better in R and D. The only distinction one can make is not between the FCA and non-FCA units but between the large and small units and the situation appears to be similar to that described by Kathuria (1989:M-115). Accordingly the point in favour of small firms is that the sequential character of modern R and D makes it possible for them to play a major role in technological innovations.

Notes

[This article is a part of my thesis on 'Impact of Foreign Collaborations/Technology on India's Foreign Trade and Industrial Competitiveness - A Study of Automobile Ancillary Industry'. I record a special note of thanks to A R Rizvi, Department of Economics JMI University, New Delhi, V L Rao, Senior Fellow, RIS, New Delhi, Nagesh Kumar, UNU/INTECH, The Netherlands (the then fellow, RIS, New Delhi), Charan D Wadhva, S P Goswami and Ajit Karnik, and Neeraj Hatekar of the University of Bombay for their valuable comments/suggestions and encouragement. But none except myself is responsible for the views, expressions, conclusion and for the errors that remain.]

1 For the details of development, adaptation and absorption and R and D thurst in developing countries see Chugan (1991).

2 For details, see Chugan (1991a, p 62 and 1993a).

3 As per Kathuria (1983:9) R and D figures measure only formal R and D and do not reflect research participation rates. . In case of small firms particularly in the early stages of innovative process, when commitments of large sums of money are not required for moulding the research efforts towards product introduction, small firms contribute more to the technical advance of society than is reflected in R and D statistics. The results of ILO surveys [Bhalla 1989:M2-7] in India, Bangladesh, Rawanda, Mali and Ecuador designed to explore the innovation potential and technological requirements of small production units often operating outside the organised or 'formal' economy shows that small enterprises have a potential to do innovations which can be exploited in an appropriate policy enivronment.

4 This is not an assumption which could be expected to come true always, but rather a general and strong feeling of industry, especially of those who have been making use of imported equipment more often.

5 For various reasons, historically, there have been poor linkages between national research institutions/laboratories and industrial units and repetitive emphasis has been put to strengthen them [Kane 1969, Desai 1979/1980, Bagchi 1982, Mann 1982; Bhattacharya 1988]. As these links have largely been limited to occasionally accepting industry-sponsored research to make their research more fruitful. First, they could work in more closer liaison with public sector enterprises as was recommended by the Working Group on Organisation of R and D within Public Sector and Relationship with the National Laboratories [Bagchi 1982] and secondly these laboratories are made to survive progressively more on sponsored research from industry [Kumar 1987a:481-82].

6 For the type of restrictions in this regard, see Mann (1982), Subrahmanian (1972) and RBI Survey Reports.

7 For the survey of literature, see Kumar (1985). As per Kumar (1991:390), a latest study on the subject, the expenditures on R and D activities of the Indian affiliates of MNEs are not significantly different from those of their local counterparts. Lieten's study (1987:236) reveals that the MNCs have a low propensity to undertake transfer of R and D, which actually is the type of R and D that upgrades the local level of technology.

8 See Pillai (1979), UNCTAD (1983), Gordon and Fowler (1983), Fairchild and Sosin (1986), Ragachand (1981), RBI (1974), Kumar (1987). For survey of literature see Kumar (1985 and 1987).

9 Evidence on high incidence of renewals of FCAs is an indication of failure of the technology importers to adapt and assimilate the imported technology and as a result, the perpetual dependence on foreign collaborators through renewals has been a continued phenomenon. See Subrahmanian (1972 and 1984) and DGTD studies summarised in Pillai (1979).

10 An examination of the nature of excessive import and transfer pricing has also been attempted by the author with respect to Indian automotive ancillary industry. For details, see Chugan (1993).

11 This is in consonance with the personal enquiries of an earlier study which revealed that the Indian engineers are now doing modifications under the guise of 'debottlenecking' and in the name of improving the productivity and efficiency of the plant. For details, see Mann (1982) Chapter VII "working of Technology Transfer Agreements".

12 Such type of industrial linkages, i e, the technology transfers through large-scale or modern units to smaller units, irrespective of these units having foreign technology, in general, have been found at very low level in Indian industries. For illustration, see Papola and Mathur (1983) for metal engineering industries in Kanpur and Bhattacharya (1988) for units operating in Howrah.

UNIVERSITY OF WALES SWANSEA

CHAIR IN DEVELOPMENT STUDIES

Applications are invited for a Chair in the Centre for Development Studies. This is one of two established Chairs in the Centre. Applicants should have a strong research record in any of the main areas of development studies.

The appointment will commence on 1 January 1996 or as soon as possible thereafter, and the salary will be in accordance with normal university practice.

Informal enquiries may be made to Vice Principal Professor K D George, but further particulars must be obtained from the Personnel Office, University of Wales Swansea, Singleton Park, Swansea, West Glamorgan SA2 8PP, Great Britain, to which office applications (10 copies) should be returned by Friday 29 September 1995.

Promoting Excellence in Research and Teaching

Liberalisation and Performance of Cement Industry

V Bhanu

In the context of the ongoing discussions of whether liberalisation and the relaxing of licensing and other controls will significantly contribute to improvements in industrial growth and performance or not, this article examines the cement industry during the various phases of control and decontrol, empirically evaluating its performance.

THE 1980s and 1990s have witnessed extensive changes in the industrial policy of the Indian government and the first steps towards liberalisation were taken by relaxing licensing and various other controls. While the advocates of liberalisation believe that this will result in significant improvements in industrial growth and performance, critics argue that the total withdrawal of the involvement of the state will have a negative effect on the nature of future growth and will marginalise the poor and other weaker sections of society. However, these arguments are not based on empirical facts, and there are no studies which examine the impact of liberalisation on the growth and performance of industries. This study attempts to bridge the gap by empirically evaluating the performance of the cement industry during various phases of control and decontrol.

I

The cement industry had been under a regime of price and distribution control, since the second world war. After the war, the controls were continued in one form or another till the industry was partially decontrolled in 1982, and totally decontrolled in 1989.

The price of cement was first controlled in 1942, when Free on Rail (FOR) destination price was fixed on a 'cost plus' basis. During the period from 1946 to 1952, the cost of production of ACC was used as the basis for fixing the cement price. In the subsequent period the retention price was fixed and revised on the recommendations of the Tariff Commissions. Price and distribution controls were continued till January 1966 when the controls were lifted, but reimposed in January 1968. The system of differential prices continued till April 1969. From April 1969 to August 1974, the industry was under a single price regime.[1] The control was total and every tonne of cement produced was deemed to have been acquired by the government at a statutorily notified price and thereafter distributed on the basis of release orders or permits issued by the concerned authorities.[2] Production and additions to capacity were controlled through licences which were required for new units as well as for expansions in the existing units. In 1982 with the declaration of partial decontrol, controls on price and distribution as well as the licensing of new cement units were relaxed. Cement production was classified into 67.7 per cent levy and 33.3 per cent non-levy output on capacity. The cement firms were free to sell the non-levy portion of their output in the open market at the price determined by the supply and demand conditions, while the levy portion was governed by the administered price, fixed by the government from time to time. Since February 1989, both price and distribution controls in the cement industry have been fully relaxed.

The industry registered significant growth, especially during the Sixth and Seventh Plans. The initial installed capacity which was around 3.3 million tonnes at the beginning of the First Five-Year Plan had increased to 29 million tonnes by the beginning of Sixth Plan and doubled during 1982 to 1989 to reach around 60 million tonnes, so that a substantial part of the additions to capacity took place in the 1980s (Table 1).

Though significant additions to capacity had been made, the rate of growth in capacity could not be sustained in the later part of 1980s and early 1990s and there was stagnation, both in the additions to capacity and production. This was related to the relatively low level of capacity utilisation in the cement industry which during this period was seldom above 75 per cent (Table 1).

Capacity utilisation is taken in this study to be the most important factor which explains the deceleration in investment in the cement industry after the mid-1980s, though it is not claimed that this is the only yardstick for measuring the performance of an industry. Profitability and value added are also important variables for evaluating industrial performance. Capacity utilisation depends on various factors, both supply and demand side factors, which will ensure the smooth functioning of production. The supply side factors, include availability of raw material, power, transportation, etc, which are sufficiently important for higher utilisation of capacity in the cement industry. Hence, this study argues that a liberal policy regarding new and additions to investment will have a limited effect, if corresponding investments in infrastructure such as coal and power are not forthcoming. In other words, both supply and demand factors, besides policy change, influence the performance of an industry and any shortage in the supply side factors can hamper higher utilisation of capacity.

II

Concept of Capacity

Basic to the study of capacity utilisation, is the need to adopt methods to measure capacity and capacity utilisation. Though several methods[3] are in use, this study has adopted Klein's definition [Klein 1960] of capacity and the Wharton method to measure capacity and capacity utilisation. Capacity utilisation is computed for a sample of 46 plants/26 firms for a period of 20 years, from 1969 to 1988 and the causes for underutilisation in the sample firms is examined for the years 1982 to 1987.

Klein who pioneered empirical studies on capacity utilisation, defined capacity as the maximum sustainable level of output an industry can attain within a very short time, when not constrained by the demand for the product and the industry is operating its existing stock of capital at its customary level of intensity.

Wharton Index: The Wharton Index [Sastry 1981] is based on time series of output. The monthly indices of output are first seasonally adjusted and then aggregated into quarterly indices in order to identify full capacity which is considered as capacity output. Capacity output between the peaks is estimated by joining successive peaks by a straight line and hence it is called the Trend Through Peaks Method. For the period preceding the first peak and that succeeding the last, capacity is estimated by extrapolation of the trend line. Capacity utilisation is obtained as a ratio of index of actual production to capacity output index.

This approach treats the peak achieved in the recent past as the capacity output. But this comes very close to defining capacity as equal to current output, which is adjusted for cyclical and secular variations in

utilisation. One merit of this method is that it uses only production data but not dubious capacity data [Krishna 1972].

The shortcomings of this method are Firstly, it is argued that peaks which are identified may not truly reflect capacity output of an industry This may be the case particularly in the cement industry which was characterised by supply constraints and rigidities due to government controls and regulations which would mean that capacity is underestimated Secondly, the method pre-supposes that capacity expansion takes place in a smooth and gradual manner, which may not be true The straight line segment also implies a uniform rate of investment between peaks for a given marginal capital output ratio, which goes against the standard acceleration principle

Methodology and Data Source

A sample of 46 plants/26 firms[1] accounting for 91 42 per cent of total capacity and 92 4 per cent of total production of cement industry has been selected For estimating capacity output, indices of monthly output have first been constructed for each of the sample plant In the computation of indices, January is the base month for all the plants in the sample, though the base year[2] may vary. The monthly output indices are then seasonally adjusted by taking 12 monthly moving average for each of the plants and aggregated into quarterly series The quarterly aggregates are further averaged These quarterly indices are graphed to identify peaks The peaks are linearly connected for ascertaining capacity output. Utilisation of capacity is analysed at the aggregate level and separately for public and private sectors

Capacity utilisation is the percentage of quarterly index of output to capacity output Capacity output is the optimum output attained in normal working conditions In the graph, capacity output is the connecting peaks or if the data do not lend themselves to step by step peak, it is the peak output at different points of time Besides, subsequent peaks do not necessarily mean higher output with the same installed capacity. They may necessarily indicate additions to capacity of the firms and hence higher output. Further, utilisation would often be 100 per cent, since quarterly index of output is treated as capacity output in a number of cases

Capacity utilisation in the cement industry is computed for the sample firms for the period 1969 to 1988 This has been compared with rate of utilisation, i e, percentage of annual output to installed capacity. This exercise is undertaken in order to identify the trend and explain the variations if any We have also analysed the causes for underutilisation. The empirical analysis is substantially based on *Cement Data Book* for a number of years, a publication of Development Commissioner of Cement

III
Aggregate and Disaggregate Analysis

The cement industry is generally not considered a seasonal industry However, in an analysis of seasonality by computing ratio to trend, a consistent pattern was evident of higher output in the months of December January and March, a lower output in April and June and no clear picture during the rest of the months

Average Capacity Utilisation at Industry Level

Table 2 presents average utilisation of capacity in the cement industry for the period 1969 to 1988 and indices of output in the sample firms for the same period is graphically presented

It is observed that peak output for the sample group at 108 5 was reached in third quarter of 1972 (see graph) The second peak was at 127.5 in the first quarter of 1978, and a new peak at 164 7 in the first quarter of 1987 However, in a substantially expanding industry like the cement industry during the decontrol period, the limitation of the Wharton method emerges very clearly, as a new peak may not be reached if production starts stagnating. A comparison of peak output index with the other indicating of performance such as profitability shows that the year of peak output is not matched with high profitability It would seem that the lower profitability, despite peak production, was due to the low retention price (fixed at Rs 100 per tonne) payable to cement producers during 1969 to 1973. However, the profitability in 1978-79 at 7 8 per cent (though lower than 10.2 per cent in 1977-78) is comparable with the index of peak output in 1978

Though utilisation fluctuated between 87 5 per cent and 100 per cent, Table 2 shows that it was higher in the 1970s as compared to the rate of utilisation in the 1980s (utilisation was low particularly in 1974 and in 1980). Similar are the findings when utilisation is taken as a ratio of annual production to installed capacity for the entire industry for the period 1969 to 1988. Several reasons may be offered for the lower utilisation in the 1980s. First, a number of new firms with one million tonne capacity commenced production in

Table 2: Average Capacity Utilisation (Sample Firms and Total Industry)

(Per cent)

GRAPH: GROWTH OF OUTPUT IN SAMPLE FIRMS, 1969-1988

the 1980s. Many of these firms experienced teething problems due to the size of the kiln and the balancing equipment installed. Secondly, the obsolescence and ageing of plants requiring modernisation affected the total output in some firms. Thirdly, powercuts/tripping in the states affected the production of cement industry to a sizeable extent. Thus, the paradox is largely explained by both the internal and external factors.

The causes for underutilisation of capacity in the cement industry is analysed based on the study of the Bureau of Industrial Costs and Prices.[6] The Bureau grouped the factors into internal factors, external factors and miscellaneous factors. Internal factors include shortage of raw material, mechanical troubles, teething trouble and labour unrest. Shortage of coal, powercuts/trippings, shortage of wagons and non availability of workable orders are covered under the external factors.

While in the 1970s, shortage of coal and powercuts accounted mainly for underutilisation, in the 1980s, shortage of power alone accounted for significant percentage of loss in the utilisation of capacity.

PRIVATE VS PUBLIC SECTOR

The industry is primarily owned by the private sector, which accounted for 87 per cent of total cement production at the end of 1988. Of the 13 per cent share of public sector, the Cement Corporation of India accounted for 5.7 per cent and companies owned by the state governments for the remaining 7.3 per cent. This study seeks to explain the exceptional performance of the central undertaking, i.e. Cement Corporation of India as well as the differences in the contributory factors causing underutilisation of capacity among public and private sector cement plants.

In order to study the trends in capacity utilisation in the sectors the sample of 46 plants has been divided into public (7) and private sector (39) plants. The seven public sector units, have been further classified into public sector units (including CCI), accounting for 1.85 million tonnes of capacity and CCI (4 lakh tonnes) only. Similarly, the private sector units (39 cement plants) have been classified into ACC (16 plants) with a total capacity of 6.92 million tonnes and others (23 plants) with a share of 10.41 million tonnes, excluding ACC.

A comparison of the average utilisation of capacity in the two sectors (Table 3) showed a higher utilisation in the private sector as compared to the public sector units. Utilisation in ACC was above 90 per cent in both the periods and it was higher than all the other plants (public and private sector). A higher utilisation in the 1980s is observed even in the CCI plants. However, it can be inferred that a significant portion of total output of cement industry is contributed by the private sector plants and an appropriate climate must be created for a higher utilisation and increased output.

Table 4 presents the causes for under-utilisation (based on ratio of production to installed capacity) in public and private sector cement units. The percentage of idle capacity in the public sector as a whole was higher during 1982-87, as compared to the performance of only CCI for the same period. It will be observed from Table 4 that there is a significant difference in the factors contributing to underutilisation in the two sectors. In the public sector plants mechanical problems have significantly contributed to the underutilisation whereas power cuts have been the main contributory factor in the private sector plants. Since the post-decontrol period has witnessed significant additions to capacity and production in the private sector, the empirical findings suggest that the supply side constrain has to be removed to achieve higher capacity utilisation.

Though several factors have contributed to underutilisation of capacity in the cement industry, factors like shortage of coal, power cuts and mechanical problems have been the most significant. Mechanical problems are internal and need to be sorted out at the firm level, but the other two external factors can be rectified only with a change in the policy of the government.

IV

This section further brings out the importance of these factors by examining the relationship between capacity utilisation (Wharton method) and coal supply in the 11 firms[7] (out of the sample of 26 firms), for the period 1982 to 1987. The firms are located in seven different states which will give a picture of inter-state variations in coal availability and utilisation. It is further postulated that availability of coal and utilisation are positively correlated, and the quarterly supply of coal as per allotment would increase utilisation significantly. The coal ratio has been obtained by dividing the quarterly supply (actuals) of coal by the quarterly quota of coal (in tonnes), for each of the 11 firms.

Simple correlation has been computed between the two variables. The emphasis is on positive results rather than the degree of relationship. Next, the sample firms have been classified into three categories, viz. low, moderate and high utilisation and the corresponding ranges are - less than 70 per cent, 70 per cent to 88 per cent, 88 per cent and above. The coefficient of correlation is positive in nine firm and

negative in the rest. Thus a positive relationship is observed between the two variables.

Table 5 presents the class intervals of capacity utilisation and the corresponding average coal ratio in the 11 cement firms. It is seen in the table, that higher utilisation in the firm is associated with higher supply of coal, though in firms like Mysore and Saurashtra cement the reverse is true. This is because the consumption of coal per tonne of clinker varies with the quality of coal as well as the process employed. Wet process plants consume more coal than semi dry or dry process plants and it may be conjectured that the dry process and efficient management (see Ghosh Committee Report on Cement Industry 1981) of the stock of coal were probably the reasons for higher utilisation in these firms, despite the low supply of coal.

Regression Analysis

Coal constitutes an important input for the cement industry. It is used both as fuel as well as a raw material. Hence a minimum coal availability is a must. Next to coal, power constitutes the most significant fuel, so much so that cement firms are advised to instal captive power generators to overcome production loss due to frequent power cuts/trippings. Data on power availability are drawn from the annual reports of Cement Manufacturers' Association for the years – 1982 to 1985 and 1987. As no information is available for 1986, the average of the other years is taken for that year. The annual reports give information about the number of days and the percentage of power cut for different states. The power availability is taken as 100 per cent if no power cut is reported and 30 per cent, if 70 per cent power cut is reported. The percentage availability is weighted by the number of days of availability in the year to get the weighted average of availability of power.

In February 1982, a policy of dual pricing was introduced. According to this policy, an output of 66.7 per cent be under administered price, while the balance of 33.3 per cent could be sold in the open market. The percentage of levy output however was progressively reduced in the subsequent years. This meant increased availability of output to the manufacturers for sales in the open market. It is postulated that this policy of the government would lead to higher utilisation. Weighted price is computed to give effect to the dual pricing system. The percentage of levy is adopted as an alternative variable. The weighted price is obtained by multiplying the levy price and the non-levy price by their respective proportion of output and then by adding them. These prices are corrected by the index of wholesale prices with base 1970-71.

The form of the regression model is as under:

$$CU_q = \alpha + \beta_1 C_q + \beta_2 P_q + \beta_3 PL_q + \beta_4 WP_q$$

Where,

CU_q = Capacity utilisation in the quarter q is in percentages (based on Wharton method)

C_q = Coal supply as a percentage of coal quota in the quarter q.

P_q = Percentage of power availability to power allotted to the industry in the state in the quarter q.

P_q = Percentage of levy cement in the quarter q.

WP_q = Weighted average price per tonne of cement in real terms in the quarter q

Firm dummies have been incorporated to give effect to the variations in the rate of utilisation across the firms as it is postulated that capacity utilisation across firms is significantly different from the base firm. The method of ordinary least square is used in the estimation. The choice of an equation is based on multiple criteria, such as R^2 and signs of the coefficients of the variables. The effect of the explanatory variable on capacity utilisation is examined in a sample of five firms[a], viz, India Cement, Madras Cement, Tamil Nadu Cement, Ba[illegible] and Saurashtra Cement for the period 1982 to 1987.

The result of the regression analysis is as follows:

Equation I

$$CU_q = -111.04 + .2102\,C_q + .53\,P_q + .679\,WP_q$$
$$(3.2095)\quad (4.5513)\quad (3.5355)$$
$$+ 2.1838\,D_1 + 8.037\,D_2 - 17.49\,D_3$$
$$(.5862)\quad (1.5779)\quad (4.5530)$$
$$+ 1.823\,D_4$$
$$(.4959)$$

$\bar{R}^2 = 0.32 \quad R^2 = 0.36$

F Ratio (7,***) = 9.1460

(The figures in the bracket are t - ratios).

No of observations = 120.

Equation II

$$CU_q = 94.90 + .1293\,C_q - .6194\,P_q$$
$$(2.1945)\quad (6.2295)$$
$$- 1.1471\,PL_q + 2.9107\,D_1$$
$$(6.7717)\quad (.8799)$$
$$+ 11.82\,D_2 - 17.62\,D_3 + 1.8030\,D_4$$
$$(2.6182)\quad (5.2193)\quad (.5522)$$

$\bar{R}^2 = 0.47 \quad R^2 = 0.49$

F Ratio (7,120) = 15.8832.

(t-ratios are in the brackets)

No of observations = 120

The R^2 of the estimated equation I is 0.36. The regression result shows that the coefficients of coal and power variables are positive and are statistically significant. The signs of the coefficients are consistent with theoretical postulates. It can be inferred from the coefficient of quarterly percentage of coal that, other things being equal, an increase in the supply of coal by 1 percentage point would increase utilisation by 0.21 per cent.

The coefficient shows the importance of coal in cement production since it is used as fuel as well as raw material. The coefficient of power availability shows that, other things being equal, an increase in power supply by one percentage point will increase capacity utilisation by 0.53 per cent (possibly firms depended on DG sets

Table 5: Average Supply Ratio of Coal and Utilisation in Select Cement Firms (11)

Utilisation		Indian Cement	Andhra Cement	Orissa Cement	Madras Cement	Mysore Cement	J K Cement	Tamil Nadu Cement	Bagalkot Cement	Kalyanpur Cement	Saurashtra Cement	Sri Digvijay Cement
Low	less than 70 per cent	0.4	-	-	0.46	-	-	0.28	0.44	-	0.61	-
Moderate	70 per cent - 88 per cent	0.61	0.78	0.69	0.68	0.64	0.74	0.57	0.61	0.78	0.46	0.66
High	88 per cent and above	0.60	0.89	0.69	0.75	0.48	0.65	0.66	0.61	0.74	0.55	0.71

Notes: 1 Per cent of utilisation in the firms is derived by Wharton method.

2 Ratio of coal (quarterly) = $\frac{\text{coal supply in tonnes}}{\text{quarterly quota of coal (in tonnes)}}$ computed for each of the firm for the four quarters of 1982 to 87

3. The ratio of coal (quarterly) is matched with utilisation (quarterly) and averaged for each of the firm.

for 0.47 per cent of utilisation). Similarly, an increase of cement price by Rs 1 will increase utilisation by 0.68 per cent. That is, cement prices have a positive influence on capacity utilisation. Among the firm dummies, only D_1 representing Saurashtra Cement (equation I) is statistically significant and negative sign indicates lower capacity utilisation in the firm as compared to India Cement.

The R^2 of equation II is 0.49 and the fit is good. In the regression result, the coefficients of the coal and power variables are statistically significant and the signs are positive. The coefficient of the percentage of levy, which is used as an alternative to weighted average price is also statistically significant and the coefficient has negative sign, as postulated. Thus an increase by 1 percentage point in the percentage of levy would reduce utilisation by 1.14 per cent. Thus capacity utilisation has an inverse relationship with percentage of levy.

To sum up the findings of regression analysis availability of coal as well as power is important for higher capacity utilisation in cement industry. While price of cement has a positive effect on capacity utilisation, levy has a negative effect.

Conclusions

The output indices for the sample firms and for the total industry registered a substantial increase during the period under study, especially in the decontrol period. During the 1980s, underutilisation of capacity and the resultant stagnation in production can be attributed to the existence of infrastructural bottlenecks, which has been empirically established. Thus the effect of liberalisation in the cement industry was diluted by the lack of investment in coal and power which resulted in shortages, which in turn, led to poorer performance and deceleration in additional investment in the industry.

Notes

[This paper is a revised version of the chapter 'Capacity Utilisation in Cement Industry' of my PhD thesis, 'Cement Industry in India – A Study of Capacity Utilisation, Investment and Inventory Behaviour', Osmania University, Hyderabad, 1992. I would like to thank R. Radhakrishna (former director of CESS, Hyderabad) member-secretary, ICSSR, my guide for PhD thesis for his constant encouragement and guidance. My special thanks to Kanakalatha Mukund for her suggestions for retraining the paper.]

1 Bureau of Industrial Costs and Prices, Ministry of Industry, *Studies on the Structure of the Industrial Economy, Cement Industry*, Volume III, May 1987, p. 19.

2 Tariff Commission (1974), report on comprehensive review of the cement industry, for the revision of fair ex-works price payable to the producers, Bombay, Government of India.

3 The approaches are rated capacity, installed capacity, the machine hour method, measures based on two shifts, maximum outpupt per spindle/loom in textile industry, cost-based measures, etc.

4 Source, *Cement Production and Despatches/ Cement Data Book*, a publication of development commissioner for cement. Though the methodology of collecting the data is not indicated, we assume that the reporting is on three shift basis, as cement industry is a continuous process industry. The criterion for selecting the plant has been availability of data on a continuous basis. 1975 is the cut-off point for the inclusion of the plant/firm in the sample.

5 That is to say if for any reason, like unusually low output in January, or commercial production commencing in the middle of the year, the indices could not be computed from January of that year, the base was shifted to the January of the following year. By this exercise we aimed at the computation of indices for 12 months to begin with, and avoid distortions in the indices, if the base month output were to be very low.

6 BICP Table 1.8, p 8. The Bureau compiled the data from *Cement Production and Despatches/Cement Data Book* for the years 1972 to 1984. Hence the source for analysing factors affecting production in cement firms, for this study and for the Bureau have been the same. Causes for underutilisation is based on installed capacity of the plant.

7 The eleven firms are – 1 India Cement, 2 Andhra Pradesh, 3 Orissa Cement, 4 Madras Cement, 5 Mysore Cement, 6 J K Cement, 7 Tamil Nadu Cement, 8 Bagalkot Cement, 9 Kalyanpur Cement, 10 Saurashtra Cement, 11 Sri Digvijay Cement.

8 Firms having positive correlation between coal availability and utilisation.

Industrial Liberalisation: Policy Issues at State Level

Sandeep Bhargava

This paper evaluates the post-1991 industrial policy reforms in India with particular reference to the state of Rajasthan. The viability of a strategy to attract new investments on the basis of financial incentives is assessed and policy, market and infrastructure impediments are highlighted. The paper provides suggestions for the design of future policy that would lead to long-term private sector industrial development

THE objective of this study is to evaluate the industrial reform process in India that began in 1991. The emphasis will be on the steps being taken in this direction at the state level and, in particular, in the state of Rajasthan. The motivation behind industrial reforms is clear. Indian industry needed to be set free from the well meaning but highly claustrophobic atmosphere of strict licensing and regulation of the 1950s, 1960s and 1970s. During the 1980s certain liberalising steps were taken but they were half-hearted and lacked a coherent political and economic agenda. The severe financial crisis faced by the Indian economy in 1991 forced the central government to take drastic legislative and policy measures to set industry free of excessive regulation in tune with the pro-market reforms seen in several other developing countries. The major components of this reform process which influence the industrial growth rate are macro-economic stabilisation including fiscal and inflation control, industrial delicensing and reform of industrial regulation, trade liberalisation, foreign exchange reforms and rupee convertibility, disinvestment in state owned enterprises as well as privatisation, ease of foreign direct investment and portfolio investment via the stock market and private sector participation in infrastructure (core) sectors like power, telecom, and roads.

Policy measures initiated by the central government have set the pace for industrial liberalisation but the implementation of these policies takes place in the states. Therefore state governments and their policies play a major role in attracting and developing industry. The success of state governments in doing so will be the focus of this paper. With external and internal pressure on state governments to increase growth we are now witnessing an 'incentive war' among states striving to attract new investments. One of the issues this paper will address is the viability of a strategy to attract new industries mainly on the basis of tax incentives and subsidies. Our contention will be that this strategy is short-sighted and will not lead to sustainable industrial development. The emphasis clearly needs to be on providing appropriate physical infrastructure (power, water, transport telecom), legal and financial infrastructure (corporate law, accountancy norms, banks, capital markets), and social infrastructure (good housing, public health, and education facilities).

The second but closely related issue is the regulatory regime prevalent in states. Although industrial licensing has been abandoned several licences and permits need to be still taken for access to land, water, and power. In addition, environmental, labour, company, and tax laws have to be complied with entailing numerous inspections on industrial enterprises. The much desired 'hassle free' environment and investor friendly administration is consequently elusive in several states. Clearly some element of regulation by the government of a newly liberalised industrial sector is desirable to prevent haphazard and detrimental growth. The nature and scope of this regulation need to be carefully assessed.

Although the focus of this paper is the industrial policy regime in Rajasthan, the central issues and policy recommendations would be applicable for a majority of Indian states. At the outset it is worth mentioning that the focus of this paper is on medium and large scale industries in the organised private sector. Small-scale industries and the policies towards them are an important part of the Indian industrial scene but will not be examined here. This paper also does not examine the role of public sector industries and the restructuring programme currently underway to make them efficient and viable.

Introduction

The share of Rajasthan in total industrial investment in India during 1993-94 was 4.1 per cent. In contrast, Gujarat led the industrial league by attracting 30 per cent of total investment over the same period. A quick look at historical data on investment reveals a similar picture. Rajasthan has undoubtedly been an industrial laggard though this description is fast becoming outdated in view of the industrial policy initiatives taken by the state government in 1990 and 1994. The poor industrial base of Rajasthan is easily explained. Being a land-locked state and lacking access to a port, Rajasthan was unable to attract industries during the British rule prior to 1947 despite being home to one of the leading business communities of India, the Marwaris. The economy was mainly rural- and agriculture-based. The predominantly desert terrain of Rajasthan and water scarcity limited the role of agriculture as a source of earnings, investment and economic growth. The industrial scenario did not change significantly for much of the post 1947 period. Agriculture and rural development remained priority areas for the state government. Some new industries did come up in the textile, mineral, and power sectors through both government and private initiatives but the geographical spread and depth of industrial investment remained limited. In the absence of modern technology and investment, traditional industries of the small and medium scale variety such as tourism, gems and jewellery, hand made textiles, and other village crafts became the major source of non-agricultural earnings for the private sector.

Several initiatives taken by the government during the 1970s and 1980s laid the foundation for the more recent industrial turnaround. The Rajasthan State Industrial Development and Investment Corporation Limited (RIICO) was formed by the government to promote medium- and large-scale industries. Similarly, the Rajasthan Financial Corporation (RFC) was established to provide funding to private entrepreneurs in the small-scale sector. The Bureau of Industrial Promotion (BIP) was established as a 'Single Window Agency' to co-ordinate clearances by the various government agencies necessary before a new industry can be set up. Sectoral development agencies to promote mining activity, small-scale, handicrafts and village industries were also established. In addition to these semi-autonomous corporations several government ministries and departments such as the Directorate of Industries, Ministries of Industry, Finance, Mines, Energy and Environment are directly involved in industrial development at the state level.

With this array of government-sponsored agencies and in the wake of the 1990 and 1994 state industrial policies the outlook for industrial growth in Rajasthan looks decidedly brighter. There has been a

substantial inflow of new investments since 1990-91 both by domestic and foreign investors. New industrial centres have developed in the districts of Alwar and Bhiwadi in close proximity to Delhi. In line with the 1991 industrial policy of the central government several proposals for investment in infrastructure sectors such as power and roads are in the pipeline. However, in comparative terms Rajasthan still lags behind the leading states such as Maharashtra, Gujarat, Punjab, and Karnataka. In this paper we would like therefore to evaluate the measures taken by the state government since 1990-91 to promote industrial growth. In particular, we would like to scrutinise the 1994 industrial policy in terms of how successful it is likely to be in raising the industrial profile of Rajasthan.

But, first, we need to answer the following questions: What drives industrial growth? And, what makes some states (regions) more successful than others in attracting industrial investment? Let us examine the first issue. The role of the government in promoting industry in a developing country remains of considerable importance. Despite the free-market, laissez-faire economic philosophy that swept through most industrialised countries during the 1980s the experience of the east Asian high growth economies highlights the pivotal role of government even in a liberalised environment.[1] For example, the state can provide a conducive environment for investment. This includes above all a stable macro-economic environment. High fiscal deficits are harmful for industrial growth since funds necessary for private investment get pre-empted by the government. High inflation and volatile exchange rates distort relative prices and generate uncertainty thereby reducing industrial investment. The government also plays a critical role at least in early stages of development in providing infrastructure for industry such as access to land, water, power, and transport. Other factors that also influence industrial growth are the financial and legal infrastructure: an impartial judiciary, enforceable property rights, a skilled workforce, and the degree to which the domestic industries face foreign competition. In the case of India these issues are addressed by policy both at the central and state level, and we shall return to this subject in later sections.

Moving now to the second question: the factors attracting investment to one state rather than another are broadly the degree to which the state administration is business friendly, the attitude of the political leadership towards industry, the speed at which industrial policy reforms are implemented, the quality of infrastructure, the fiscal situation including the tax/subsidy regime, nature and degree of corruption, industrial relations, and the law and order situation. In a recent survey of the ten best states for doing business (see *Business India* (June 6-19, 1994)), Rajasthan did well to be included in the ten despite drawbacks such as an inhospitable climate, predominantly unskilled labour, and low literacy rates. Compared to the other states being surveyed (Gujarat, Maharashtra, Madhya Pradesh, Punjab, Karnataka, Uttar Pradesh, Kerala, West Bengal) it is evident that Rajasthan needs to catch up on several counts. For instance, Rajasthan was ranked ninth in terms of how favourable the political leadership and bureaucracy is towards business.

The rest of the paper is structured in the following manner. In Sections II and III we outline the key features of the new industrial policy of the central government and the government of Rajasthan paying attention to the consistency and viability of these measures. In Section IV we focus on the ground level reality of industrial policy reform. This section draws on extensive discussion with government officials, bankers, and managers and owners from the corporate sector. Here we also evaluate the response of firms, markets, and financial institutions to the new policies in place. In light of our discussion we recommend measures for the design of future policy to promote efficient and sustainable industrial development at the state level. Lessons will be drawn for industrial development in Rajasthan and other states from the advanced states such as Gujarat and Maharashtra. Section V concludes with a discussion of the role of government in promoting private sector industrial development and the nature of regulation necessary in the new liberalised regime.

II
New Industrial Policy: Central Government

The objectives of the industrial policy regime nurtured by the central government during the period 1948-1980 are typified by the Industrial Policy Resolution of 1956. This resolution emphasises the 'need to develop heavy industries and machine making industries, to expand the public sector, to build up a large and growing co-operative sector and to encourage the widest diffusion of ownership and management in private industries including the need for prevention of monopolies and concentration of economic power' (see Government of India (1994)). This policy laid emphasis on developing cottage and village industries as well as modern small-scale industries. The objective was to promote balanced development across regions and the fulfilment of socio-economic goals. Industries were classified into three categories. In the first category industries were reserved for the public sector. In the second category of industries the public sector was meant to take the initiative with supplementary participation by the private sector. The third category was left open to entry by private enterprises. This policy regime spawned a large industrial structure in India which was dominated by an inefficient and loss-making public sector. Private sector industries did develop but only in limited sectors and regions where industrialists found ingenious ways of getting round stifling bureaucratic red-tape. In a perverse fashion the private sector achieved precisely what the government policies had intended not to happen. For instance, the licensing regime resulted in concentration of large industries in relatively few hands. Licensing and location restrictions resulted in fragmented and under-utilised capacity. The objectives of balanced regional growth were also not achieved as successful industries were concentrated in a few regions of the country. Reservation of product lines for the small-scale sector prevented the development and use of modern technology and resulted in low quality products. Industrial sickness became widespread in small, medium, and large scale sectors due to restrictions imposed by the government on the entry and exit of firms, on retrenching labour, on selling factories, and on acquiring and selling land. Until the early 1980s the industrial growth rates did little to raise the average GDP growth rate of 3 per cent to 4 per cent.

During the 1980s the central government tried to set right the impediments to private industries and a few liberalising measures were taken leading to a sharp rise in industrial growth but it was only the 1991 policy declaration that put in place a dramatically new regime with an appropriate set of incentives aimed at industrial development. An underlying objective of this policy was to remove the administrative barriers to entry faced by domestic and foreign firms and also remove restrictions on capacity expansion and diversification. The major features of this new policy that signify a sharp departure from earlier polices are the following: (1) The category of industries reserved for the public sector due to security and strategic reasons has been pruned from 17 to 8. (2) Industrial licensing has been abolished for all industries except those with environmental or security implications. (3) The Phased Manufacturing Programmes that force businesses to adopt indigenous manufacturing methods have been abolished. (4) The mandatory convertibility clause by which government-owned financial institutions can convert their loans to industry into equity has been abolished. (5) The pre-entry investment controls on large business houses (with assets over Rs 1 billion) have been abolished. The Monopolies and Restrictive Trade Practices (MRTP) Act of

1969 is now concerned primarily with preventing restrictive and unfair commercial practices as well as consumer protection. (6) Approval of foreign investment of up to 51 per cent equity in high priority and hi-tech industries that require large investments has been made easier. Likewise foreign technical collaborations have also been made easier. Alongside these reforms the Indian government has also brought down trade barriers and devalued the exchange rate twice since 1991 to achieve a competitive and credible exchange rate for the rupee.

For those familiar with the pre-1991 industrial and economic policies these new policy changes are bold and sweeping. The effects are becoming evident. Domestic investment and foreign (direct as well as portfolio) investment have risen sharply since 1991 though there was an initial period of inactivity due to the economic contraction in the wake of the macro-economic crisis of 1990-91. Industrial growth rates during 1994-95 have increased by 8 per cent over the previous year, and the private sector investment rates are rapidly increasing. The relaxation of budgetary deficit targets and the build up of inflation during 1994-95 are a cause for concern but the initial steps for a healthy and vibrant industrial sector have been taken. Admittedly, much of the increased investment figures since 1991 reflects investment approvals and intentions rather than actual implementation. For instance, a recent survey by the Centre for Monitoring the Indian Economy (CMIE) of over 3,000 industrial projects with planned investments of Rs 7,764 billion ($247.57 billion) reveals a strong increase of 46 per cent in investment intentions but very weak growth of 4.4 per cent in projects being actually implemented (see *Financial Times*, London, January 10, 1995). It is data like these that indicate that there remain serious constraints in the industrial and business sector that hold back investment intentions from being realised.

The central government puts in place a broad policy framework for the development of industry but it is the various state governments that are the front line implementors of reform. These governments play a crucial part in the actual development of new and existing industries. The policy towards industry adopted and implemented by the state government therefore becomes of vital importance. Once such policy initiative has been the 1994 industrial policy of Rajasthan to which we now turn our attention.

III
New Industrial Policy at State Level

The key elements of the strategy to promote industrial development as stated in the policy document [Government of Rajasthan, 1994]' are improvement of the investment climate, expansion of physical and social infrastructure, simplification of rules and procedures, speedy access to inputs and clearances for industries, increased role of private sector in infrastructure development, promotion of labour intensive industries as well as rural and small scale industries, increase availability of skilled manpower and support for quality improvement, and a renewed focus on exports and local resource based development and exports. A laudable feature of the 1994 policy was that the state government simultaneously put in place legal changes to support the reform measures so that there were no legal obstacles to implementation. Given that the new policy came into force as recently as June 1994 it is too early to assess its success. However, the degree to which the Rajasthan government has been able to implement its own policies in the past and the manner in which the state has responded to the 1991 central government policy will indicate how successful the new policy is likely to be.

Infrastructure Development

RIICO, the major industrial development agency, has been instrumental in developing over 200 industrial estates with supporting infrastructure such as power, water, roads, telecom, housing and other social amenities. However, only a handful of these estates have been successful in attracting and sustaining profit-making industries. Private enterprises have now been also permitted to establish and maintain industrial areas provided they are at least 10 kilometres away from an existing RIICO estate. For highly polluting industries special zones are planned with common effluent treatment plants. The rules relating to allotment of land outside industrial areas and conversion of agricultural land to industrial land have been considerably simplified. The shortage of power is a common problem facing industries almost throughout India. The state government has taken several initiatives to overcome this shortage and provide for future industry demands. New thermal, gas, and lignite based power plants are at various stages of being commissioned. Following the trend in other states of India private sector participation is being encouraged in power generation along with guaranteed payments for the sale of power to state-owned electricity boards. Water resources are being enhanced by use of more efficient and innovative schemes for the use of surface and groundwater including that from the Indira Gandhi Canal. To ease transport bottlenecks a massive investment programme is in progress to convert the meter gauge rail network into broad gauge. Private investors are being encouraged to build and maintain roads and bridges, and legislation to allow such investors to collect toll from users is in place.

In the absence of mature capital markets development financial institutions such as RIICO and RFC play an important role in providing funding for industrial projects. The loan and equity portfolio of these institutions has increased steadily but there has been concern about the quality of the portfolio. There is now a renewed emphasis on careful project selection and better monitoring of projects by these agencies to prevent default on payments. The boom in leasing and finance industry has also helped release funds for industrial investment. The record of commercial banks (that have themselves been undergoing restructuring) in financing industry has been mixed. The securities scam of 1992 and strict guidelines on the quality of loan portfolio have made the banks cautious in their industrial lending. At the same time the sharp increase in government borrowing from banks and Reserve Bank of India since 1993 has reduced the funds available for commercial bank lending to industrial sector. Net bank credit to the government grew at 17 per cent in 1993-94, while bank credit to commercial sector fell from 13 per cent (1992-93) to 6 per cent during 1993-94. Measures taken by the central government in 1994-95 budget on tax reform and for investment promotion have led to the reduction of user cost of capital. However, it is now recognised that industrial investment may be held back not so much for lack of funds or the cost of capital but the presence of significant idle capacity in the manufacturing sector. This is one of the unfortunate legacies of the pre-1991 industrial policy regime. Since new licences were denied if idle capacity existed, established firms had an incentive to maintain idle capacity to keep out potential entrants.

Simplification of Administrative Clearances

Increased awareness of environmental damage caused by industrial waste has led to stringent environmental control of industrial units. However, taken to an extreme such controls, in the same manner as pre-1991 industrial licensing regulations, can curtail industrial growth. Steps have therefore been taken to ease the procedure through which environmental clearances are granted and certain types of small-scale industries have been exempted from these clearances altogether. The previous regulatory regime required several inspections of factories and plants often involving different departments checking for the compliance of the same rules. This regime caused considerable disruption to business activity and encouraged corruption. The government has streamlined these controls by replacing checks for various labour laws by one common inspection. The criteria under which factories would be inspected have been made explicit and also reduced in number. Checks

under the Factories Act have also been reduced and prior permission is now required by a senior officer before an inspection is carried out.

Considerable emphasis is now being paid to speedy clearances of investment proposals. The availability of land, water, power, pollution clearances to new units is being facilitated by various government agencies including a high powered committee headed by the chief secretary that can grant immediate clearances. A particularly innovative feature of the new policy is that a time frame has been set within which the clearances from the various departments have to be granted if the application by the entrepreneur is complete in all respects [see Government of Rajasthan 1994].

Financial Incentives

The state government offers a variety of incentives to new and existing industrial units in the small, medium, and large sectors. These incentives are in the form of subsidies for capital investment, purchase of diesel generating sets and purchase of equipment for testing product quality. Schemes are also in place that offer sales tax incentives and deferment as well as those offering interest-free loans against sales tax paid. Sales tax exemption on purchase of machinery and purchase tax exemptions are also available under certain conditions. Fortunately, the state government has recognised that provision of financial incentives does not make up for inadequacies in infrastructure the quality of which in the long run is more important for attracting and maintaining investments. On the basis of this argument the government plans to discontinue capital investment subsidy from March 1997 and the funds released will be used for infrastructure development. The sales tax structure is also being simplified and directed at promoting value addition by encouraging the processing of agricultural and mineral products within the state rather than mere production of the raw materials.

Other Measures

The new policy emphasises the development of industries based on local resources that are abundant such as leather, wool, ceramic and glass, and minerals such as marble, granite, limestone, and gypsum. Agro-industries based on mustard, soyabean, cotton, jojoba, cut-flowers are being encouraged and so are hi-tech industries such as tissue culture and floriculture. The electronics industry which is relatively environment-friendly and can provide substantial export earnings is being provided financial incentives. Rajasthan is one of the major tourist destinations in India and the development of tourism-related service industries which offer scope for employment and foreign exchange generation are being given high priority. Significant steps have been taken to attract investments from foreign companies and non-resident Indians (NRIs) through both joint ventures and wholly-owned subsidiaries.

IV
Policy Implementation

It would be naive to assume that this ambitious reform programme can be translated into action resulting in a lasting increase in industrial growth rates in Rajasthan. The success of an industrial reform programme depends on how well it is integrated into other elements on the reform agenda such as fiscal and monetary policy, trade and exchange rate liberalisation, and financial and legal reforms. Political compulsions at the central and state level also impact on the speed with which reforms are implemented specially when there might be resistance from trade unions and incumbent firms that have benefited from a closed, protected, and inward looking industrial regime. These issues are important both at the central and state levels and need to be examined separately. However, in line with focus of our study and on the basis of extensive discussion with industrialists and bureaucrats we are able to point out some of the major impediments that need to be removed at the state level for effective implementation of reforms.

Infrastructure Development

Robust infrastructure support is the key to industrial development. It is now widely recognised that the most useful role the government can play in supporting business activity is to ensure that there is adequate supply of essential industrial inputs such as power, water, transport, and telecom services. The steps being taken by the state government on this front are bold but the results will only be seen with a time gap due to the inherent gestation lags of infrastructure projects. It is essential that the state government withdraws from activities where it has no comparative advantage and which can be profitably undertaken by the private sector. Public money thus released could instead be spent on infrastructure development. These efforts need to be supplemented by private sector participation in infrastructure projects and several such projects in the power and transport sector are already underway. However, it would be unrealistic to assume that private sector firms will take over the responsibility of, say, building power plants unless the state government takes the initiative. For instance, massive restructuring is required to reform the loss-making electricity boards in Rajasthan and other states. The state government needs to separate its obligation of providing cheap power to poor farmers and small-scale industries from the broader objective of ensuring adequate and regular power supply to all categories of end users. One solution would be to charge the free market rate for electricity from all users and then reimburse funds to users on the basis of their financial standing.

The efforts of state government agencies to develop industrial estates to ensure adequate provision of infrastructure are very welcome. But as has been pointed out earlier, relatively few of these estates boast an enviable record. The quality of infrastructure in the majority of industrial estates needs improvement. Problems range from power shortage and poor transport to an indifferent local administration and excessive political interference. Not surprisingly, the estates that are doing well are the ones where private entrepreneurs would have been most likely to succeed on their own initiative (for example, Bhiwadi, Alwar, Jaipur, and Kota). This may be due to the proximity of these estates to business and political centres, water sources, or transport networks. Clearly, the state government needs to divert its limited funds in developing those areas for industry which do not have these inherent advantages but still bear potential for industrial growth. This could be, for example, a mining region capable of supporting mineral-based industries but lacking skilled manpower, transport and other industrial infrastructure. The bottom line should be that the state intervenes to provide support where market and industries cannot develop on their own steam.

The same dictum holds true for the provision of financial assistance through state-owned development banks such as RIICO and RFC. These institutions have done well to support a number of small, medium, and large scale industrial units. Due to a variety of inter-linked reasons such as price restrictions, financial tax/subsidy regime, regulatory regime, restrictions on closure of factories and labour redundancies, protection from domestic and foreign competitors, several of these units have become 'sick' (unviable) and defaulted on their loans. At the same time 'healthy' industrial units do not need financial support from development banks and can easily tap the newly liberalised financial markets for funds. Financial institutions therefore need to redirect their strategy by (a) identifying those projects that genuinely require loans at subsidised rates or are unable to access the capital markets, (b) carefully screening applications and assisting applicants in the design of projects, and (c) improving the monitoring of ongoing projects to prevent possible financial failures.

Financial Incentives

The role of investment and tax incentives has been long debated in the economic development literature [see, for instance, Galenson 1984]. Incentives are generally

viewed as second best stimulants for industrial activity, the first best being government policies that provide a congenial business environment. In a bid to attract new investments several states have offered a range of incentives over the past few years. Competition among states to attract investors is of course desirable but it is the tactics being used that are a cause for concern. Incentives that are broad-based, easy to get, and distort market prices can in fact be counter-productive. There are several instances of industrial units that become unprofitable once the incentives are withdrawn. Moreover, the state's own financial situation may not be able to support these incentives in the long run in view of lost revenues. Recognising these fallacies various state governments are now attempting to restrict the provision of incentives in the future and a timetable for the withdrawal of existing schemes is being developed. It is expected that most schemes will not be available after 1997. Any remaining incentives should be focused and used to overcome existing market distortions and infrastructure constraints. The monetary value of these incentives should decline over time so that the recipient industrial units work towards being viable even after the withdrawal of incentives. Emphasis should be given to designing incentives that are conditional on investment in new technology, productivity and skills improvement, and increased export earnings. Strict government discipline is essential to prevent rent seeking behaviour by entrepreneurs of the type witnessed in the pre-1991 regime.

Competition among states by way of incentives tends to be a zero sum game and can even be harmful. A region or state that may not be viable in the long term for a particular industry might still attract this investment by offering incentives. In due course when the incentives are withdrawn and if the industry fails there would be negative repercussions on other industrial units in that state. At the same time the loss-making industry could simply move from one state to another in search of short-term gains provided by the incentives. The whole structure of fiscal incentives needs to be examined by the various state governments and the centre in a co-ordinated manner to maximise the investment in India as a whole. Rapid implementation of the tax reforms proposed by the Chelliah Committee and implementation of a value added tax across the country is also necessary.

The incentive schemes in place to promote local resource-based industries are clearly desirable. But once again the objective of these schemes should be to prepare the entrepreneurs to face the market unaided once their businesses have matured. These incentives should be aimed at promoting processed products based on minerals, agriculture, and livestock. One of the ironies of the industrial production system in Rajasthan is that, despite being a major producer of several kinds of industrial raw material, most processing is done in other states. Therefore Rajasthan looses out on value addition, and the associated employment and industrial earnings.

Administrative Procedures and Clearances[4]

The 'licence and inspector raj' is dead long live the 'clearance and inspector raj'. Red tape, tedious and complex administrative procedures, and a suspicious government bureaucracy has long been the bane of industrialists in India. Fortunately, the 1991 industrial policy of the central government made much of that history. The steps taken by the state government to simplify the process by which access is available to land, water, and power have also improved the investment climate. But the task has only just begun. The time schedule of clearances in the industrial policy document [Government of Rajasthan 1994] indicates that there are still seven different agencies that have to be approached for a new industrial project. Each agency has the power to stall applications for months and often years thereby putting off investors. The setting up of the empowered committee to speed up clearances is of course a welcome move but there is a practical limit to how many cases this committee can handle. What is required is that the various departments themselves undergo a transformation in their attitude towards and dealings with industrialists and businesses. In this respect Rajasthan has several lessons to learn from the progressive states such as Gujarat and Maharashtra. These states have bureaucracies that are business friendly and genuinely assist potential investors in setting up industries by removing administrative obstacles. This pro-business culture and attitude pervades at all levels – state and district – of the administration.

Admittedly, Rajasthan has only recently put industrial development high on the political-economic agenda and some time is needed before the administrative machinery can gear up to the new liberalised, pro-business era. To ease this transition it would be useful for government officials at all levels to be provided training courses in the needs of businesses and practical ways of reducing red tape faced by these businesses. The various chambers of commerce and industry can play a useful role in this regard. A sea change in attitudes is also required in the regulatory regime. Inspections of industrial units under various acts have been simplified but officials can still harass owners and managers on several counts. One way of reducing the loss of industrial time and money trying to satisfy regulators would be to emphasise self-regulation enforced by industry associations. To encourage compliance of regulations substantial rewards could be offered to the scrupulous industries and heavy penalties could be imposed on the rule-breakers.

Unfinished Agenda: Lessons for Further Policy Reform

In the previous section we discussed a few broad areas on which the state government has to work to provide an improved industrial environment in Rajasthan. Let us now outline some specific tasks for the future policy agenda of the government. Some of these issues require attention from both the state and central governments. However, it is in the interest of the state government to push for reform regardless of moves by the centre since the rewards of industrial investment first become evident at the state level.

(1) One of the most serious impediments to industrial investment in India is the lack of an 'exit' policy for labour that enables firms to sack labour. In a bid to protect the welfare of workers and given the absence of an unemployment benefit or social security system the government has imposed restrictions on industries wishing to reduce their workforce when faced with declining demand. This policy of the government and similar restrictions on the sale of factories and industrial land by existing units under the Urban Land Ceiling Act has to a large extent contributed to widespread industrial sickness and bankruptcy. Eventually, the loss-making unit has to be taken over by the government or attempts made to revive it through the Board for Industrial and Financial Restructuring (BIFR). This process remains largely unsatisfactory because there is little scope for the owners of sick companies to actually shut down the unviable unit and start afresh in another line of business. The lack of an exit policy also acts as a major deterrent to new or increased production by both domestic and foreign companies and is also responsible for investment by firms in labour saving technology. To a large extent the reason why the government drags its feet when it has to take decisions on labour redundancies is political. The organised industrial workforce has a strong voice and the trade unions have considerable clout in the major political parties. However, it needs to be recognised that this constituency is a fraction of the total Indian population of 900 million. By maximising the welfare of this minority the interests of the majority are being neglected. A total of 10 million people work in the public sector (which is fully unionised) and about 6 million work in the unionised private sector. A concerted effort needs to be made by all political parties and the government to change the views of this minority workforce through

persuasion and education. At the same time the National Renewal Fund created in 1991 to compensate and retrain unemployed workers needs to be strengthened.

(2) We have already mentioned the need for government officials to show their commitment to reform by changing their attitudes towards business activity Similarly politicians need to adhere to the reform route even if there is resistance from various entrenched lobbies. Political leadership that remains faithful to reforms and lays down clear policy guidelines for implementation by bureaucrats (for example, in Gujarat and Maharashtra) is an essential prerequisite for industry to flourish. The success of the state industrial policy is as much dependent on the positive response of markets, financial institutions, trade unions, and companies as it is to initiatives of the government. Therefore investors should view the policy changes with a positive attitude and carry out investments that are likely to generated both short and long term gains. Industrial lobbies should reject the offer of subsidies and push the government for provision of better infrastructure. In order to speed up the investment process it is easy to break rules and buy clearances but such practices mar the industrial climate. Therefore chambers of commerce and industry should help restrain such activity by their members In the long run politicians too will find that their standing with voters would improve if they had a clean image Development banks, commercial banks, and venture capital funds should direct their (often subsidised) lending to the small-scale sector or enterprises that are entering new, high risk fields not be supported by the stock market. Established companies and large-scale enterprises on the other hand should rely on the domestic and international debt and equity markets for funds

(3) Transparent and consistent policy rules are imperative at all levels. Recently major corporations (e g, TELCO) have been allowed duty-free imports of capital equipment on a discretionary basis by the central government. Clear guidelines will reduce such ad hocism and help dispel uncertainty in the investment environment. Similarly the Securities and Exchange Board of India (SEBI), Reserve Bank of India (RBI), and Ministry of Finance should bring out uniform, clear guidelines for companies that wish to raise funds from the stock market. This has not been the case recently because of continually changing regulations on pricing of share issues, private placements, and allotment of shares to promoters. One reason for the lack of clear policy is that the financial liberalisation process is itself quite recent and the regulatory bodies are reaching optimal rules only via trial and error.

(4) State governments need to invest heavily in promoting a few key industries that are suited to the local conditions and have sustainable, long-term returns. The Rajasthan government's initiative in identifying and promoting thrust industries based on local resources is a step in the right direction. Industries that are low polluters and are not heavy users of water and power such as the electronics and computer industry should be given further support. In the case of the computer industry, the state could develop a software estate drawing on the resources of local engineering institutes such as BITS Pilani These estates need to offer tangible benefits such as free or low price land, cheap satellite and communications links to private software companies The success of Bangalore and its computer business community has important lessons for Rajasthan in this field.

(5) Rajasthan needs to further exploit its proximity to Delhi and prosperous neighbouring states such as Punjab, Haryana, and Gujarat The state government should develop a strategy of riding on the industrial success of these states Rajasthan could become a service state for these states by providing low cost support in manpower, banking, and transport. The state's recreation and holiday resorts could become a major attraction for business communities of neighbouring states Last but not least the ancillary industry could be further developed to provide high value components for industries in other states

(6) With nearly 70 per cent of the population living off the land the development of a competitive and efficient agriculture production system needs to remain at the centre of economic policy The state government has provided incentives to develop agro-industries which should be given top priority The development of non-farm rural activity will help decongest urban areas, reduce the unemployment in both urban and rural areas, provide critical inputs for certain industries such as food processing, pharmaceutical, textiles wool, leather goods, and increase export earnings.

(7) The public sector should get out of those industrial and service activities that can be efficiently and competitively provided by the private sector. The funds and resources that would then be freed should be used to provide those products and services that are genuine public goods or are necessary to meet key social objectives. Sincere and serious efforts have to be made to restructure the numerous loss-making public sector units. This may call for the closing down of certain units that cannot be made viable or there may be a need for full privatisation.

(8) There has to be a sea change in government policy and attitudes towards exports. Despite the obvious pay-offs in terms of foreign currency and investment the government has yet to make the environment conducive to growth of exports specially of manufactured goods. It is only recently that a special cell for promoting exports has been set up within the industry ministry. Considerable improvements are needed in the institutional, marketing, and transport backup required for exports. The problem with exports is of course deeper As convincingly reported in *The Economic Times* (New Delhi, October 31, 1994) the central government s policy towards exports needs to establish priorities and concentrate on promoting specific sectors. The composition of Indian exports has changed little in the post-1991 liberalisation period. Agriculture and allied exports continue to dominate along with gems and jewellery, textiles, yarn and ready-made clothing, while there has only been modest growth in high value, hi-tech exports such as engineering and electronic goods This trend is worrying because it reflects that India has made little

progress in reducing its reliance on agricultural revenues that can be severely affected by weather and external conditions.

'It appears that manufacturing companies are not keen on developing exports because the profit differential between selling in foreign and domestic markets is marginal, not least because of the distorted price structure of domestically produced goods. At the same time there are high transaction costs associated with exports because of cumbersome procedures and archaic laws. As a result the manufactured exports that do take place are aimed at exploiting tax and other incentives provided by the government often on a discretionary basis. This activity becomes lucrative for short-term gains with no long-term strategy for technological improvement and growth in the export sector. Governments at both central and state level therefore need to identify those activities in which local industries will have dynamic and lasting comparative advantage in the international markets and tax incentives should be redirected towards these activities.

V
Conclusion

Industrial development is essential for raising economic growth in a country like India. While the broad policy framework to develop industry is formulated by the central government, it is the state governments that can influence the strategic location of new investments and the associated payoffs. Therefore, state government policy towards industry is of fundamental importance. We have discussed a number of key issues that are likely to contribute to the success of this policy. Private investment and business enterprise flourishes in a stable macro-economic environment which is free from pervasive government intervention, physical infrastructure if of good quality, and where institutions are being developed for law and order, basic health, and education.[5]

Industrial success in the long run requires better institutions, low transaction costs (or costs of doing business), markets that respond to price changes, and access to efficient and appropriate technology. In developing countries these conditions cannot be generated exclusively through the market because factor and product markets are often missing, public goods (including infrastructure) are under-provided, and market failures in technology and R and D are acute [see World Bank 1992]. The case for activist policy is best illustrated by the remarkable success of East Asian economies [see Rodrick 1994 for a useful overview]. The experience of these countries suggests that the government can play the role of a pace-setter in its interaction with the private sector. Government intervention for the promotion of industry through subsidies and even trade protection is most effective when there are stringent performance standards to be achieved by the private sector. The signs of such an industrial policy regime are clearly evident in Rajasthan and other Indian states.

In the liberalised environment for Indian industry the role of government therefore remains even greater and not less. What is to be changed is the nature of government intervention from being a patronising agent trying to develop and regulate every aspect of business activity to an active and responsive catalyst for industry. The government's primary objective should be to provide the necessary physical and financial infrastructure. At the same time the state should develop a tax/subsidy regime that helps overcome genuine externalities and market failures on the demand and supply side. And, of course, the role of government remains crucial in developing a regulatory framework for industry that is effective and fair.

1 For an overview of the post-1991 economic reforms see Ahluwalia (1994), Basu (1993), Bhagwati and Srinivasan (1993), Joshi and Little (1993), Kapila (1994), Sachs (1994), and World Bank (1994). Ahluwalia (1985, 1991), Gouri (1993), and Khatkhate (1992) provide analyses of the industrial policy regime during the pre-1991 period. Conceptual issues pertaining to industrial development are presented in Pack (1988), Lall (1992), and Rodrick (1994).

2 Free markets are good for economic growth but government discipline is essential. This has been one of the major lessons from the experience of the highly successful east Asian economies [see World Bank 1993].

3 There is considerable similarity in the content of industrial policy declarations by other Indian states since 1991. What is different is the extent and style of implementation. For an interesting inter-state comparison of policies see Venkatesan (1994).

4 See Khatkhate (1992) for a review of the most serious regulatory impediments to industrial development observed in Asian countries including India.

5 See Shapiro and Taylor (1990) for an analytical review of the role of government in promoting industrial growth in developing economies.

Flexible Specialisation, Technology and Employment

Networks in Developing Countries

Regina M A A Galhardi

Recent studies question the replicability of flexible specialisation model of advanced industrialisation to small firm operations of developing countries. Small firm clusters in the third world countries are not new strategies but old practices pursued in order to overcome their technological and market weaknesses. The studies challenge the assumption that labour surplus can prove to be the competitive advantage of these firms since most of them provide inferior working and payment conditions. Further, lack of strong inter-firm linkages deny collective efficiency to these firms to deal with the changes in the market

I
Introduction

THE article comments on the literature on the small firm variant of the flexible specialisation (FS) model and questions its feasibility of fostering small scale industrialisation in developing countries. In doing so, the article questions some 'dogmas' of the FS thesis such as 'collective efficiency', 'skilled workers' and 'multi-purpose equipment'. It is based principally on primary information gathered from recent work carried out and commissioned by the ILO on the textile, rattan, batik, footwear and metal industries in Indonesia; shoes and autoparts in Brazil, the autopart industry in Argentina and the carpentry and building sectors in Zimbabwe.

The concept of FS, as coined by Piore and Sabel (1984), means 'a new economic regime' based on less rigid manufacturing technologies than mass-production (MP). These less rigid technologies existed before in various regions of western Europe. They were based on skilled workers using sophisticated general-purpose machinery to turn out a wide and constantly changing assortment of goods for large but constantly shifting markets. Piore and Sabel claim that "firms using a combination of craft skill and flexible equipment might have played a central role in modern economic life" (1984:5).

This optimistic view based on 19th century industrial districts (IDs) and encouraged by 'vestiges' of craft production in Italy, West Germany, and Japan was followed by a number of interpretations, criticisms and followers.[1] It has been influencing development analysts and providing a framework for research in both developed and developing countries.[2]

Holmstrom (1993), for instance, suggests that there is a good chance that some elements of the 'Emilian model' could be incorporated into Indian small and medium firms and provide similar results if encouraged by national or local governments. An overview of potential IDs patterns in developing countries also claims that

> not only industrial manufacturing systems akin to small firm industrial districts occur in developing countries but observations indicate that the institutional and organisational framework of the industrial district concept has great relevance to small enterprise development under incipient industrialisation [Nadvi 1994].

Examples of networks in developing countries often mentioned are (i) shoe production in Brazil, Mexico, Peru and India, (ii) production of hammocks in the northeast of Brazil, (iii) the knitting industry of Petropolis/Brazil and Tirappur/India, (iv) auto repair shops in Kumasi/Ghana, (v) rattan furniture in Indonesia, and (vi) woodwork in Tanzania. These cases and others are used to illustrate the relevance of 'collective efficiency' and flexibility even at a relatively backward stage of economic development/industrialisation [Schmitz 1989, 1990, Nadvi and Schmitz 1994]. This view is also known as the small firm variant of the FS model.

The evidence mentioned in this article challenges the novelty and some characteristics of this approach. Although some features associated with the ideal model of FS can be found in clusters of small firms in developing countries, they are not 'new' strategies. On the contrary, they are 'old' practices pursued in order to overcome the technological and market weaknesses of those firms.

The second section discusses small firm networks by contrasting the most common examples cited in the literature with recent evidence gathered from developing countries. It challenges the 'low road' approach and the assumption that labour surplus can become the competitive advantage of small firms in developing countries. The empirical evidence commented on questions some of the characteristics of the small firm variant of the FS model when adapted to analyse the case of small firm networks in developing countries, e.g. surplus labour, strong inter-firm linkages and the achievement of collective efficiency. In Section III the paper sheds light on the replicability of this model in developing countries. The role played by institutions (public and/or private) to provide group-based production support services and information to the small firm clusters was discussed as well as some technological characteristics of the clusters studied. The skill and employment implications of the FS model is analysed in Section IV. The last section summarises the main points discussed throughout the paper.

II
Small-Firm Networks in Developing Countries

The small-firm variant of the FS model is centred on the role played by the clustering or networking of small firms around a set of related activities and a strong inter-firm division of labour. It is argued that small firms cannot cope individually with a rapidly changing demand and highly differentiated markets. However, the cluster or network provides a collective ability to deal with changes in the market and to innovate, i.e. a kind of collective efficiency [Schmitz 1989].

When this variant is applied to analyse developing countries' networks of small firms, the innovative character of the firms as the main weapon in competition is, however, substituted by the existing labour surplus. Case-studies which show sectoral agglomeration but also technological stagnation and low remuneration for labour are called upon to illustrate this 'conditioning' factor. As stated by Schmitz:

> If in the low labour surplus regions of South Germany and the Third Italy the dynamic is more one of high wage/high technology/high quality, in vast labour surplus LDC's the dynamic tends towards low wage/low technology/low quality [1990:21].

Other studies, however, indicate that this competitive trend cannot be generalised. Some small-scale industrialists in developing countries have successfully embarked on the high technology/high quality route but, it is said, combining innovation with sweat labour [Schmitz 1990]. Pyke and Segenberger (1992) also found examples of sweatshops operating alongside relatively high paying small firms using the latest technology. They concluded that small firms can compete when organised in the appropriate way and this competition need not take place on the basis of inferior working and payment conditions. They distinguish between two approaches by which firms, industries and regions have tried to meet challenges of international competition. The first is called 'low road' to restructuring and consists of seeking competitiveness through low labour cost, and a deregulated labour market environment. This approach leads to a kind of destructive competition because poor wages and terms of employment hinder the firm in acquiring and keeping the labour required for efficiency and flexibility, and rarely induce the firm to invest in its labour force to make it more productive. The second is the 'high road' of constructive competition which is based on efficiency enhancement and innovation. The key to attaining this is better organisation and a better mobilisation and utilisation of productive labour, providing economic gains and hence wage gains and improvements in social conditions which, then, permits a better use of technology. Moreover, their research indicates that the cheap labour, low labour standard route of development (low-road strategy) is neither necessary nor desirable. This alternative may result in a vicious, downward-spiralling cycle [Segenberger and Pyke 1991].

Recent studies challenge the assumption that labour surplus and related issues, e.g. low wages and labour conditions, can become the competitive advantages of small firms in a cluster context in some developing countries.[3] An examination of autoparts production in a regional agglomeration of small firms in Argentina shows that the combination of old machinery and the intensification of the work process with no investment in new technologies, no workers' training or education and no skill upgrading seems to lead to a production system which does not offer any possibility of transition into first world markets and of sustainable development.

> This low-price strategy offers no viable insertion into First World markets and no future for sustainable growth. The plight of Victoria's manufacturers who settled for a precarious balance between cost reduction/high quality, and of those who chose or fell into the low-price-only path and are now tensely searching for lost regional niches, indicates the temporal and quantitative limitations of this view [Roldan 1994:36].

A recent study on the carpentry and building industries in Zimbabwe shows that, with few exceptions in the former sector, inter-firm linkages within a group of enterprises which supply or co-operate with each other do not exist. The low degree of mechanisation and enterprise specialisation inhibit inter-firm co-operation [Rasmussen and Sverrisson 1994]. In the metal-working cluster of Campinas/Brazil, no form of inter-firm co-operation was detected among small firms. Events like borrowing tools, sharing a large order at peak times, exchange of technical/commercial information, frequently mentioned in the literature on industrial districts, were not observed among the clustered firms. The identified client-supplier relationships in the shoe-makers cluster of Vale do Rio dos Sinos/Brazil cannot be directly associated to the concept of collective efficiency. Horizontal inter-firm linkages through which possible co-operative efforts among producers of the same product could be developed were not observed [Ruas et al 1994]. Similar findings are reported by a case studied on the Argentine autoparts production. In this cluster,[4] vertical inter-firm linkages were not easily performed due to technical economic and fear of being copied (lack of trust among members) factors. The 'leading' firms do not subcontract more than 3 to 10 per cent of their production process. A number of horizontal productive linkages and institutional networks have been established in the 1990s by the 'intermediate' firms. The smallest firms, however, are trying desperately to set up new networks such as trading organisations, consortia, a common platform in national industry discussion, etc, so far with little success. This study concludes by asking to what extent will sectoral and geographical concentration be conducive to external economies based on firms' networking if the assumed common basis for shaping those linkages does not exist?

In Indonesia, two clusters of small firms involved with shoe production show that the majority of enterprises there can be characterised as technologically stagnated enterprises, surviving on the basis of commercial and industrial subcontracting relationships with larger firms rather than as independent units closely linked to each other. In one cluster, firms invest in retailing directly to the consumer. In the other, they link themselves with larger production enterprises or with large wholesalers in the nearby cities. In both cases, collective efficiency is not achieved within the clusters considering the limited interaction among member firms [Smyth et al 1994].

In addition, the lack of interaction between small and large firms has been pointed out by these studies as a limiting factor to technological upgrading, specialisation or 'mere survival' of the former. The smaller firms' limited access to the 'complementary assets' provided by large firms appears as one of the causes related to the smaller firms' weaknesses and/or failure. In the case of the batik industry in Indonesia, Smyth et al (1994) reports, "small and medium scale establishments either placed themselves into subcontracting relations with large industries or shut down and transformed their working places into hotels and restaurants for the tourist market". Also, in the rattan industry, they observed that the most crucial relationship between firms is that which render small firms entirely dependent on the large exporters for their raw materials, credit, and marketing [Smyth 1994:26]. Rasmussen and Sverrisson (1994) indicate that linkages between building material suppliers and large distributors in Zimbabwe are either anonymous or non-existing, often forfeiting potential mutual gains of co-operation. They observed that enterprises in this sector remain atomised and therefore "the learning effects, especially from more advanced business partners, are limited, and this adds a further impediment to specialisation and mechanisation" [Rasmussen and Sverrisson 1994:15]. In Argentina, small providers of autoparts to the domestic spare parts market complain about the lack of support from other autoparts producers of any piece which could be vertically linked to theirs and, principally, large firms' lack of interest in establishing alliances with them. This lack of support from or access to large firms' complementary assets does not offer smaller firms without investment, without machining recycling, with low level of automation and using very traditional technology, any hope of survival in an open economy where competition is based on higher quality/low cost products [Roldan 1994].

The above examples of industrial clusters are not the result of 'new' attempts to overcome mass production's limitations but, on the contrary, these economic and social organisations of small firms coexist with the dominant regime and have, in some cases by passed mass production. Indeed, they are examples of industrial organisations which exist for a very long period of time and are not, therefore a 'new' setting. They are really a survival alternative to the smaller firms. They are old forms of organisation established without planning, whereby small firms try to minimise their weaknesses and serve a 'lost' niche market. However, these can be improved through institutional arrangements (private and/or public) which provide technical, financial, managerial and training support to the cluster of small firms as commented on below.

III
Institutional Networks

The experience of advanced industrialised countries has accentuated the importance of institutions in promoting innovative co-operation and in fostering and ensuring technological dynamism in networks. In developing countries, recent studies have shown that the lack of these institutions is an obstacle to the development of the small firm sector and clusters even if they are addressed to the internal market. For instance, in Zimbabwe, the lack of support programmes/measures to assist small firms in easing some of their problems, especially capital and services (transport, repairs, auditing, leasing, legal and technical advice, etc) is one of the key constraints to the 'desirable and feasible' development of flexible mechanised enterprises [Rasmussen and Sverrisson 1994].

Other studies illustrate how the creation or strengthening of common institutions has facilitated the technological upgrading and enhanced international competitiveness of the firms within the cluster. In Argentina, through new or revitalised associations, the network of small autopart firms tries to persuade the government in favour of internal market protection, credits, export subsidies, tariff control, etc [Roldan 1994]. In the early 1980s, a joint marketing enterprise which acts as an export agency for some 25 small- and medium-sized saw-mills and manufacturing firms in the wood-processing sector and provides marketing and export services was established in Chile. Besides marketing, the enterprise's staff give advice on technology, maintenance techniques and necessary new investment. It carries out regular quality checks, and arranges meetings of all saw-mill managers at irregular intervals for discussion of normally similar technical and organisational problems encountered by the firms. Horizontal co-operation is also pursued through an entrepreneurs' organisation. The association, through the creation of joint marketing channels, tries to minimise the high transport costs and offers a diversified range of products to the group. It establishes contacts between producers and buyers and organises joint participation in trade fairs, the result of which has been a more intensive exchange of information on design, technical problems, etc. among the member enterprises [Messner 1993].

These case studies suggest how SMEs' growing export orientation has to be accompanied by a complex organisational and technological adaptation and stresses the importance of inter-firm and institutional networks in the process of developing their international competitive position.

Through the Small Urban Producers Programme (SUPP), run by the ILO/UNDP, a participatory support strategy for small producers combining: (i) financial instruments (mutual saving and loan associations), (ii) a technical and production promotion instrument (common facilities workshops), and marketing strategies (market development and diversification); (iii) training activities which are group-oriented and aim at promoting organisation; and, above all, (iv) the promotion of independent socio-occupational federations (as a new social actor) has been implemented since 1982 in 15 towns in Mali, Rwanda and Togo [Maldonado 1994]. Among the principles underlying this programme are those which support the concept of ID, especially the 'peaceful' merge of co-operation and competition. They are: (i) gradual mobilisation of the participants' own financial, technical and human resources with a view to their self-reliance; (ii) organisation and participation aimed at stimulating the participants' desire for improvement and affirming their social identity, and (iii) institutional recognition and representation of participants, enabling them to negotiate, assert their rights and cope with the constraints inherent in their unfavourable economic and institutional environment. This approach realises that the vulnerability of small-scale production units is due primarily to their isolation, rather than to their small size. As argued by Maldonado "they must therefore co operate through flexible and loose networks to establish effective contact and support structures controlled by the producers themselves" (1994:3).

These experiences in setting up small enterprise associations and organisations in developing countries for providing group-based production support services and information to a large number of small firms sectorally concentrated suggest that FS cannot emerge spontaneously in a developing country context. The lack of an institutional framework necessary to promote co-operation and stimulate innovation within the cluster is a major obstacle.

Moreover, the above mentioned case studies also indicate that small firms' flexibility and specialisation based on a skilled labour force, operating multi-purpose machinery and willing to change products/processes according to highly differentiated markets is not the main picture in developing countries. In Zimbabwe, 12 out of 26 enterprises in the carpentry sector employ unskilled and semi skilled labourers on a regular basis, in addition to trainees and casual labourers. The construction enterprises employ mostly unskilled labourers, which makes the sector one of the most important for absorption of the lowest level of unskilled workers. In the garment industry, the small enterprises employ mainly semi-skilled workers. The low skill level of the labour force has been attributed to the limited level of mechanisation of the firms surveyed and the relative simplicity of the products demanded [Rasmussen and Sverrisson 1994]. In Indonesia, shoe production is specialised in middle and lower middle class leather shoes. The clusters of small firms do not compete for the upper class markets. In these clusters there is no evidence of flexible markets and flexible products as claimed by the FS literature [Smyth et al 1994].

Therefore, the evidence reviewed shows that despite the existence of flexibly organised enterprises in developing countries they can adjust to changing demand conditions due to a diversified capacity to provide different but unsophisticated products. These are directed to lower income groups and produced by unskilled and casual workers operating single purpose machinery and hand tools. This trend is particularly true for clusters of small firms directed to internal markets which are not stable nor sophisticated. The demand is mainly for simple products or copies of mass produced items which depend on the income of the urban and rural customers.

This observation indicates that there is a dichotomy between flexible organisation (FO) and flexible specialisation (FS). These concepts cannot be interpreted in the same way in both developed and developing countries. In the case of advanced countries, FS requires intra- and inter-firm FO based on the use of advanced techniques and the availability of a skilled labour force. In a developing country FO is not based mainly on advanced technology but on traditional technology to cope with customised demand that does not require or cannot afford the use of advanced technology. In addition, the lack of local expertise or technological capability are also limiting factors. Therefore, in the case of developing countries, small firms can manufacture varied products through a kind of FO which does not always require the use of multi-purpose equipment and multi-skilled workers. FS is not, in this case, a requirement for flexibly organised enterprises devoted to a small portion of the low-value local market.

Furthermore, these small firms – especially when trying to cope with the limited, stagnated or recessive internal markets – are not technologically advanced neither minimally mechanised. They may require some flexibility in products and processes but this is mainly based on the use of single function machinery and the work of unskilled or semi-skilled labourers who can handle several broadly defined tasks.

The evidence reviewed suggests that a model of industrialisation based on flexibly organised small enterprises as experienced by some advanced industrialised countries/regions cannot be expected to emerge spontaneously in countries which have as

yet only taken the first steps towards industrialisation.

IV
Skills and Employment Implications

According to the FS model, designers must be so broadly qualified that they can envisage product and production together; production workers must be so broadly skilled that they can shift rapidly from one job to another, and more important, they must be able to collaborate with designers to solve the problems that inevitably arise in execution. It is also argued that "as skills become more generally useful, more and more employers will compete to hire the well-rounded worker" [Piore and Sabel 1984:273]. As a result, the latter's wages will be driven up widening the gap between these and the wages paid to unskilled workers whose job opportunities will diminish in the long run. The creation of this highly skilled workforce seems to generate a segmentation of the workforce into core and peripheral workers which may have pervasive consequences for the already segmented third world workforce.

This core/periphery model of workforce segmentation is, however, a conceptual simplification of the complex, close and often crucial working relations inside and outside organisations as illustrated by the labour market particularities in the shoe manufacturing industrial cluster in RS/Brazil. The core labour market which comprises workers who are employed by the firms on a regular basis is characterised by low wages, low skill, low inter-firm mobility and lack of formal training policies. The peripheral labor force is less skilled than the core since they are engaged in manual tasks, not having to deal with sophisticated equipment in workshops. They are mostly formed by women who are also involved with their household tasks, while their husbands are in general employed in the core market. This peripheral work conducted by women is however, of a 'core' importance to raise family income.

There is also the case of the 'core' worker who (i) moves to the periphery where he participates as a foreman in workshops, helping the owner to supervise and train the unskilled workforce, or (ii) decides to open a subcontracting workshop. Moreover, within the core, multi-tasking is associated with several degrees of skill in a variety of work situations that evolve from lower skilled jobs to highly skilled jobs.

The existing fragmented empirical evidence suggests how difficult it is to set up a clear division between skilled and unskilled workers and, therefore, between 'core' and 'periphery'. The definition of skilled, semi-skilled and unskilled workers cannot be explained entirely by technical qualifications or schooling level and does not always correspond to the skill levels of the workers. In some cases, these categories are, unfortunately, much more related to the gender of the workforce as well as the remuneration of work. As observed in the batik industry in Indonesia most of the tasks performed by men in the factory-based system and considered as 'skilled' work were done by women in the home-based cottage industries with lower wages [Smyth et al 1994:31].

Gender asymmetries seem to be exacerbated by the accentuated dualism of the labour force working in flexibly organised enterprises. Women and older workers are found in the periphery more often than their young male counterparts. Furthermore, women are often either displaced or relegated to the least paid jobs when individual firms or branches grow in size and upgrade their technologies of production.

In terms of employment, it seems too early to make generalisations. There are some indications, however, that employment may expand if support conditions were offered for the development of flexibly organised small firms in a cluster context. In backward developing countries/sectors, a low-road strategy may create a demand for unskilled and casual labour which may have substantial significance. In other countries/sectors following a more advanced or high-road strategy, skilled and semi-skilled workers will be required. The combination of these strategies in an economy, however, seems to generate more opportunities for employment rather than limiting it. However, much more data and systematic analysis is needed to reach firm conclusions.

V
Conclusions

FS is characterised as a single model with a definite set of labour consequences. The empirical evidence, however, shows that the reality is much more varied. In developing countries, the case studies on small firm clusters cover countries and sectors with extremely divergent levels of economic and industrial development. Although they result in a mixed experience regarding technology and production organisation patterns within the clusters and among them, some common features were observed. First, the assumption that labour surplus can be the competitive advantage of small firms in developing countries does not correspond to the evidence provided, principally that based on clusters of small firms producing for export sectors. Second, horizontal inter-firm linkages and co-operation are not a general trend. In most of the cases, small firms do not interact and co-operate with each other because of their low level of mechanisation and specialisation and/or fear of being copied or lack of trust relationship among them. Third, a collective ability to deal with changes in the market and innovate, i e, collective efficiency, was not observed in several clusters due to the limited interaction among member firms. Fourth, institutions to promote co-operation and foster innovation as well as to provide capital and services such as technical advice, training, credit, leasing, transport, repairs, etc, to the firms within the cluster are much needed, the lack of which seems to be a major obstacle to the emergence of FS in a developing country context.

The flexible production and organisation of small firms geographically concentrated in such context seems to be a survival strategy of enterprises struggling for a market niche which is, in general, a 'lost' local market, i e, that market which does not attract the interest of large companies. Moreover, this strategy is not based on skilled workers and general-purpose machinery but, on the contrary, on the available unskilled and semi-skilled workforce operating with 'second-generation' equipment in general. These idiosyncratic circumstances suggest that a kind of flexible production based on the use of new technologies and a skilled labour force to compete in highly demanding and differentiated markets where competition is based on product quality cannot be replicated willy-nilly by uneducated and unskilled third world labour forces.

The actual low level of skill encountered in the cases/sectors surveyed seems to be a limiting factor to the generation of a qualified labour force so crucial to the successful implementation of flexible production in such a context. The demand for unsophisticated products, and the existing simple machines or manual tools in the small firms do not stimulate the formal training of workers because they are not required. Market influences the type of goods produced and the technology used. Since the market is limited or constricted, efforts to technological upgrading are also limited. Therefore, industrial processes with a relatively low level of mechanisation, involving a series of very simple and independent operations which demand little specific skills from the worker, are performed by a large number of available unskilled workers changing tasks according to the fluctuating demand. This kind of flexible production organisation based on the unskilled labour surplus seems to induce a 'vicious circle' that does not render developing countries any opportunity of achieving international competitiveness.

A kind of high-road strategy, on the contrary, seems to be able to generate the synergies necessary for industrial growth, skill upgrading and employment promotion in a developing country context. This strategy, however, appears to exacerbate the segmentation of the workforce into core and

periphery This pattern of employment may have detrimental consequences for the already segmented third world labour force, in particular for the female labour force which is relegated to the periphery a long as industrial clusters adopt flexible production organisation

Notes

1 See, for example, Stoper (1989) Scott (1988) Saxenian (1991) and Hirst and Zeitlin (1989) The latter advocate that I S has much usefulness in explaining the relatively bad British manufacturing performance which they attribute to the persistence of MP methods and mentalities They say that 'those national economies and regions that have weathered the crisis of the 1970s and 1980s best seem to be those whose firms have gone furthest down the route of flexible specialisation or have managed to introduce elements of flexibility into mass production' [Hirst and Zeitlin 1989 11]

2 See, for instance the papers presented at the symposium on 'The Role of Industrial Districts in the Application Adaptation and Diffusion of Technology' organised by UNCTAD, in co-operation with the German Appropriate Technology Exchange Centre of the Federal Republic of Germany [UNCTAD 1994] and the views expressed in the *IDS Bulletin* (1992)

3 See Roldan (1994), Smyth et al (1994), Rasmussen and Sverrisson (1994) and Ruas et al (1994)

4 In this cluster the networking strategies vary between two extremes On the one end, there are firms following a kind of 'high-level' strategy for growth and competitiveness in external markets based on international technical and quality standards On the other 'crisis' firms following a kind of 'low-level' strategy which is based not on product quality but rather on reducing costs without investment in a protected internal market are found [Roldan 1994]

5 Inter-firm relationships can be explained by a conceptual framework developed by Teece (1986) This framework suggests that a firm seeks collaboration with other firms in order to get access to complementary assets that are indispensable to the successful commercialisation of an innovation This view is interesting because it emphasises not only the importance of the knowledge accumulated in the firm but also other, not less relevant assets such as skills, know how and services like marketing, competitive manufacturing, specialised information and after-sales support [Galhardi 1994]

Understanding Capitalism

Indira Rajaraman

Global Capitalism and the Indian Economy by C T Kurian; Orient Longman, New Delhi, 1994; pp 127, Rs 45.

'TRACTS for the Times', the title of the series of which this monograph is the sixth, has the flavour of an earlier time, when the pace of intellectual life was less frenetic than it is today. Scholars had the leisure to advance values and opinions and others had the leisure to read them. Which is not to say that there is no need for such discourse in India today. The Indian experiment in all its vastness and diversity is surely in need of continued evaluation and debate.

However, the intended contribution of the Kurian tract is not very clear. It is not addressed principally to the post-1991 economic reforms in India, which occupy less than one-fourth of its total length. The canvas is altogether broader; it is capitalism, the global embrace of it, not the Indian embrace, or attempted embrace, in particular. On capitalism, the author makes plain his position very early and very succinctly in the preface, thus: "When you begin to understand capitalism you realise that you cannot be neutral about it: you are either for it or against it. I am against it, and will press and work for an alternative though I know that at present I have to live with it and within it."

Perhaps it is because they do not understand capitalism sufficiently, but there are a number of thinking people who are neither for nor against capitalism, but quite simply see it with its many defects as one way by which to order economic relations which does not constrain human ingenuity and initiative. They would be quite willing to consider alternatives of the kind that Kurian would press and work for, but he does not suggest any. He merely confines himself to saying that the global economic system "...will have to be replaced, but at present a feasible global alternative does not exist. But then alternatives have to be contextually evolved, rather than taken out of any ready-made blueprint" (p 84). Even if a ready blueprint is not available, the author makes no attempt to outline the kind of non-capitalist direction towards which the global system could be moved or nudged from the present-day context. A writer of a tract cannot stop at saying what he is against. He has to say what he is for.

Neither does the author, as he certainly might have been expected to do given his global focus, examine the causes of the failure of experiments in this century with systems that for want of a better term may be labelled 'anti-capitalist'. An account of why the forces of capitalism emerged victorious would have provided grounds for debate or discussion. In the face of silence on that issue, without any recommended alternatives either tried or untried, the reader is at a loss to know where the tract intends to go.

Perhaps the purpose is to advance the understanding of capitalism as a system, the better to draw the lines of battle between its detractors and supporters. If that is so, it does not help to say that the Great Depression of the 1930s "indicates that capitalism has a logic completely alien to normal logic" (p 16). After Keynes, after the enormous literature on the Great Depression, after all the post-Keynesian work on the micro foundations of macro-economics, that sentence struck me as sorrowfully ill-informed. There are other passages such as the following: "But the capitalist's quest for profit is ceaseless 'Accumulate, accumulate' – is the motto of capitalism" (p 14). In the late 20th century, when the focus of attention is on the wide and persistent differences in the rate of accumulation between different capitalist nations, the naivete of that sentence severely strains credulity.

The author distinguishes between "trade meant to exchange goods (without or with the medium of money)" and "trade meant to make money" (by which he means arbitrage, presumably) (p 90). The first is described without qualification as "advantageous, particularly between national economies, and should be encouraged". That sentiment is at variance with an earlier description of how the Ricardian theory of comparative advantage, developed for "independent countries at about the same level of development freely entering into trade", was conveniently misinterpreted by English colonialists who "used the theory to put forward the argument for 'free trade' as such" (p 29). So then, the reader wants to know, is trade between national economies not at the same level of development a bad thing? Should such trade be discouraged? There are other internal contradictions. Take a passage such as the following: "Capitalism in the 1980s and 1990s has manifested not its noble or progressive features, but rather the tendency to exploit and exclude, to segment and restrict" (p 91). Nothing in the pages that precede that statement, nor in those that follow, suggest that capitalism has any good features whatever, let alone nobility or progressivity.

The chapters on the post-war global economy contain passages such as the following: "One of the operational assumptions of monetarism was that an increase in rate of interest was the best way to fight the inflation that was becoming widespread by the late 1970s. This was the policy that the Reagan administration adopted in the early 1980s" (p 72). Monetary policy is independent of the executive in the US, and was particularly so during the early 1980s, when the tight money policy of the then chairman of the Federal Reserve Board did not, as it happens, find favour with the Reagan administration. On the oil price hike of 1973, the author commends the OPEC nations, who "did not belong to the big league of capitalist countries" for having named their price (p 50). However, after having committed themselves to making available "part of their new windfall gains for developmental activities in the LDCs", they went back on that commitment. "This was largely the handiwork of private banks in the US" (p 51). As it happens, however, OPEC funds were held outside the US, and the handiwork should more correctly be attributed to private banks in Europe, not all of which were European branches of US banks.

Large sections of the tract are devoted to denouncing *laissez-faire* capitalism at a time when the need for intervention has long been conceded and debate centres on the degree and nature of that intervention; and to criticising standard causes of market failure that are generally accepted. That global markets can be imperfect is known. Fresh evidence of this for a particular product or commodity would have been a scholarly contribution, a mere blanket assertion of its existence is not. That speculative flows of short-term capital are destabilising is known. A scholarly contribution to what is by now a considerable literature on the phenomenon, and how to curb it, would have been a welcome addition; a mere denunciation of it is not.

Continuing with the class of unexceptionable statements, here is another: "...there is nothing to guarantee that an increase in aggregate growth by itself is a good thing;... Where the vast majority of people need drinking water, growth in the value of 'Indian manufactured foreign liquor' is no compensation" (p 92). That aggregate indices of growth conceal the composition of the flow of goods and services is surely well known. On drinking water, which the state has failed to provide, surely the task of withdrawing from direct engagement in manufacturing is necessary, if not sufficient, to release energies for the provision of basic public goods. The author does not agree: "The state requires economic power – a production base and command over capital; in brief public sector units – to deal with capital adequately. Such units must fulfil at least three major requirements. First, they

must demonstrate productive efficiency; they must derive the maximum possible output from a given combination of inputs. (It may be noted that this is very different from market efficiency, which is what counts in a capitalist order.) Second, they must be able to generate a reinvestible surplus. And third and most important of all, they must become instruments in the hands of the state to demonstrate how capital under social control can be made to function. Here, public sector units should show that the role of capital can be different from searching for the highest monetary gain, that capital can be utilised to initiate, sustain and augment productive activity in different spheres of the economy as socially determined. To put it differently, public sector units are required for the state to demonstrate how capital should behave and thereby indicate to private capital, both domestic and foreign, what the priorities and expectations are. Private capital cannot be expected to toe the line, but there must be guidelines to indicate to what extent deviations will be tolerated. That is the way to discipline capital. In principle at least, this is how China is dealing with foreign capital" (p 116). This is not the place to get into an argument on how China is dealing with foreign capital. The starting point was drinking water in our country. Why is it, after all these years of sizeable state command over capital, that there is still insufficiency of drinking water, on which at least all of us agree? Why is it that capital under social control did not show how capital should behave, and show the right priorities?

On the pre-reform phase of Indian economic development, the author has this to say: "Import substitution and the complementary step of concentration on basic industries, initiated during the Second Five-Year Plan period, were eminently reasonable for the long-term development of a strong and self-reliant Indian economy. Considerations of nationalism more than economic growth had influenced this choice" (p 33). If the choice was the correct one, and in the national interest, why was it that "The policy measures adopted gave a tremendous boost to those industrialists who already had enormous resource power, enabling them to have a more comprehensive grip on the economy and the apparatus of state power"? The only explanation offered by the author for this is that "indigenous capitalism was ready to be aggressive". Why was it that state intervention in production was not able through exemplary performance to exert disciplinary control over capitalist forces, however aggressive those forces might have been?

On the inequalities that developed during the 40 pre-reform years, the author adds, "Economists in general were not particularly bothered about this; they subscribed to the 'trickle down' theory which maintained that while the economic benefits of growth would initially go to well-to-do sections, gradually and in the long run, they would percolate down to everyone" (p 93). This is a condemnation of economists which is unwarranted and unfair. The vast literature on income distribution and poverty which began in the 60s, and resulted among other things in the employment provision programmes which continue to the present day, are sufficient evidence of the overwhelming concern of economists, with the misdirections of policy during that long period.

I can do no better than to close with one final quote: "Hence, to be convinced about the beneficial aspects of global capitalism one needs much more than strong theoretical arguments. Substantiating evidence is called for and the burden of proof is definitely on those who make the claims, not on those who challenge them" (p 91). Substantiating evidence is at hand, right next door in east Asia, as it happens, where country after country has successfully used the global capitalist framework to pull out of poverty. It is for us either to accept that evidence, or to remain unpersuaded, and wait for more evidence to come our way.

HOUSING THE URBAN POOR

Policy and Practice in Developing Countries

Edited by **Brian C Aldrich** and **Ranvinder Singh Sandhu**

This important volume presents original case studies drawn from most major developing countries. It provides a clear sense of the direction in which the housing field is moving. The breadth and variety of the experiences presented provide an understanding of the patterns and dynamics of this problem which transcends any particular country.

CLOSING THE TECHNOLOGY GAP

Technological Change in India's Computer Industry

Hans-Peter Brunner

Dr. Brunner provides a reinterpretation of the history of India's computer industry using a novel method for measuring price-performance or quality gaps. This is perhaps the first policy-oriented study which simultaneously suggests ways by which countries which are still developing economically can achieve technological parity with industrialized countries.

Uncertain Future of Public Enterprises

Ramaswamy R Iyer

Public Enterprises in India: Changing Perspectives by S N Raghavan; Asian Institute of Transport Development, New Delhi, 1994; pp xii+227, price not mentioned.

THE book under review is a well-meant undertaking obviously motivated by a degree of sympathy for and commitment to PEs. Unfortunately, the first impression of a well-structured and scholarly book did not survive a careful reading: the book is of surprisingly uneven quality. Nevertheless, the earnestness of the author and the importance of the subject demand a detailed review of the book.

We need not spend too much time on instances of careless writing: (a) the use of the term 'public sector', in the title and in the body of the book, as a variant for 'public enterprises'; the repetition in the Introduction of the old idea of a dilemma in reconciling autonomy and accountability which the author himself rejects later (p 52), and the reference to "the inefficiencies associated with PEs" (p xi), which conflicts with the author's own later evaluation (see Chapter 3 as also p 149). However, a word needs to be said about the reference in the Introduction to "heavy dependence on budget support". This is an unthinking repetition of a common and erroneous perception. Budgetary allocations for approved plan outlays are acts of public investment and not 'budget support' (implying a favour done to PEs); and far from being 'heavy' such allocations have been woefully inadequate in recent years. The governmental provision of funds to cover the losses of deficits of some PEs is indeed 'budget support', but it is a very minor component of the overall fiscal deficit; and 'heavy dependence' is a wrong description, as what the PEs in question want is not 'budget support' but solutions to their sickness or structural problems, which only the government can find - a responsibility which the government has failed to discharge.

A more important weakness of the book is the curious failure to make significant use of the vast body of material that is available on a wide range of themes and topics relating to PEs making one wonder about the extent of the author's familiarity with it. That remark needs to be at least briefly substantiated. The following is an illustrative listing of material to which there is no reference either in the text or in the bibliography:

(i) official documents such as the Industrial Policy Resolution of 1948, the IP Statements of 1977 and 1980, the Ministry of Finance Memorandum of 1969, successive Plan documents (the book refers only to the IPR 56 and the IPS 1991);

(ii) the Reports of Committees and Commissions, e g, Paul Appleby's report on the government's industrial and commercial enterprises (1956), the Krishna Menon Committee's Report (1959), the Reports of the Administrative Reforms Commission (1967), the reports of several parliamentary committees, including one by COPU on Accountability and Autonomy (1987-88) and the Report of the Eighth Plan Working Group on PEs (1989);

(iii) management literature: the writings of (among others) V V Ramanadham, Laxmi Narain, Mary Shirley, Prajapati Trivedi, the present reviewer, Leroy Jones (on the evaluation of PEs in Pakistan and South Korea), Sebastian Morris and Nagaraj; the discussion on 'holding companies' in the July-September and October-December 1988 issues of IIMA's journal *Vikalpa*, the March 1990 issue of *Public Enterprise* (the journal of the International Centre for Public Enterprises, Ljubljana), and the papers of a seminar organised by the Institute of Public Enterprises, Hyderabad, in collaboration with the now defunct Bharat Business International at New Delhi in November 1990, the material on privatisation (Samuel Paul's article in *EPW* and the discussions that followed, the books on the privatisation experience in developing countries and in the UK edited by V V Ramanadham, *Selling the State. Privatisation in Britain* by Cento Veljanowski, and books edited by T L Sankar/ Y V Reddy, Geeta Gouri, and S R Mohnot.

Perhaps the author is indeed familiar with all this material but has put it aside on the basis of some curious kind of selectivity. Be that as it may, the historical/analytical review of PEs (chapters 1 to 5) suffers from many weaknesses.

For instance, in the account of the origins and evolution of PEs in India, the discussion is largely in the language of economists ('market failure', 'externalities', 'natural monopoly', 'allocative efficiency', 'lumpy investments', etc). It is useful and interesting, but a more extensive use of official documents would have given us a better idea of the actual thinking – objectives, expectations, concerns – of planners, policy-makers and their advisers. There is not much reference in the book to ideas which were rightly or wrongly influential from time to time: 'machines to build other machines' (the Mahalanobis model), 'self-reliance', 'socialistic pattern of society', occupying 'the commanding heights of the economy', ideas of regional development, the development of backward areas, the generation of employment, and so on.

It has been stated that the establishment of the Food Corporation of India was "sought to be justified on the grounds of social and equity objectives" (p 4). The objectives (market stabilisation, price support to farmers, assurance of supplies at affordable prices to consumers) were genuine and not mere rationalisations; and they were being handled departmentally before the establishment of FCI as a corporate body. The crucial question about the FCI is a different one which the author fails to recognise: given the entirely non-commercial nature of the functions, and the fact that the FCI acts as an agent of the governments and that all the critical decisions are taken by the government, was it right to set up a corporate body? Should not the government have continued to perform what are essentially governmental functions direct through a departmental set-up? (There is some discussion regarding this in the literature.)

The two chapters on the growth of the PEs and their performance are undistinguished. They do not go much beyond the rudimentary classifications and categorisations of the Public Enterprises Survey. (Similarly, in a later chapter the author uncritically accepts the simplistic 'taxonomy' devised by the DPE.) There is not much fresh analysis and hardly any new insight. The author fails to see that tables showing the 'share' of PEs in the total economy or in particular sectors do not really tell us much. They merely give us an idea of the PE presence in the economy (which is a reflection of the prevailing philosophy) but not what that presence succeeded in achieving, and whether (hypothetically speaking) the situation would have been significantly different in the absence of the PEs. On this too, some discussion is available in the literature.

Again, despite the later acknowledgement on p 39 that evaluation in aggregate terms is not useful, that is precisely what is done in chapter 3. (Incidentally, Baldev Raj Nayyar's comparison of public and private enterprises is mentioned on pp 38-39; the author fails to see that the comparison is biased and is vitiated by the choice of enterprises representing the two sectors. This has been pointed out elsewhere by this reviewer.)

There are repeated references to 'autonomy' but there is no detailed examination of a host of issues having a

bearing on this, such as the corporate form and its logic; the complex and dysfunctional relationship between the government and PEs; the manner in which the CAG's audit of PEs is conducted; the 'vigilance' arrangements and their inhibiting effect; the kind of scrutiny and control that parliament seeks to exercise; the Supreme Court's rulings that PEs are 'state', and so on This has been extensively discussed in the literature. A simple recommendation of 'autonomy' without coming to grips with these problems and complexities has very little operational value.

On 'holding companies' as a measure of reform, the crucial point is the distancing of the subsidiaries from the government. that is what prevails in Italy, and that was what the Sengupta Committee had in mind. Unfortunately the government of India has never accepted this principle, and so the advocacy of this particular organisational device does not seem very useful in the Indian context. In any case, during the last few years, the holding company idea has ceased to be a topic of current debate. (Incidentally, the reference to SAIL as a holding company on p 59 is misleading and ignores history SAIL is indeed a holding company in relation to IISCO but not in relation to Bokaro, Bhilai, Rourkela and Durgapur, which are divisions and not subsidiaries The author must be aware that SAIL was established as a holding company in 1973 but was restructured as an integrated company in 1978)

As for the discussion of the MOU system it contains some erroneous statements and shows a less than complete understanding of what has been happening. The author could have improved his understanding through detailed discussions with those who have been actively concerned with the operation of the system. (It does not appear that the author made much use of interviews in writing his book)

Turning now to the impact of the new economic policy (NEP) on PEs, we find that here again the treatment is thin. For instance, one of the elements in the NEP is the re-demarcation of areas for public investment: these were reduced first to eight and then to six. What does this imply for the existing PEs (quite a number) whose activities fall outside those six areas? Have they lost their legitimacy? Will they on sufferance waiting to be privatised or phased out? Will they be frozen in their present form and prevented from taking decisions indicated by their corporate plan, on the ground that they are in areas no longer earmarked for public investment? There is no governmental pronouncement on these questions, but surely the book should have gone into them

Again, the book does not squarely face the fact that July 1991 was a watershed in the history of PEs in this country, and that their very basis and rationale have been undermined. In practice, of course, things go on: the existing PEs continue; and the government does not talk about privatisation. However, the logical implications of the NEP need to be made explicit and discussed The book fails to do that, but gives an innocuous account of the 'reforms' (a question-begging term); uncritically accepts the specious argument that disinvestment is a measure of reform; seems to find much wisdom in the rather perfunctory report of the Committee on Disinvestment; and then proceeds to make recommendations about PEs, using concepts and categories (collective goods, common pool goods, core industries, etc) which are drawn from an earlier philosophy and are alien to the NEP.

It would have been far more useful if the author had undertaken a detailed enquiry into the manner in which PEs are in fact responding to the changes The disappearance of import control, the sharp reductions in custom duties, the introduction of certain import-facilitating schemes to favour exporters, the abandonment of old pricing systems, the welcome extended to MNCs, and so on, have had a major impact on Indian industry in general and on some PEs in particular (for instance, SAIL, BHEL, Hindustan Zinc, Hindustan Copper, IPCL, Hindustan Organic Chemicals). STC and MMTC have lost their old roles and are looking for new ones. None of these PEs is retreating into a corner and sulking: they are all strenuously working out their own strategies for coping with change and surviving. One would have expected the book under review to examine the responses of a selected number of PEs to the challenges before them, make an assessment of their future, and make recommendations for governmental policies in the light of that assessment. (Such an examination would of course have required a series of structured interviews)

The last chapter entitled 'Directions for the Future' contains recommendations couched in general terms with no attempt to work out the operational implications. "Greater functional autonomy": but through what means? How shall we overcome the difficulties experienced in the past? "The control of the Ministry has to be removed" – yes, but how? "Accountability has to be ensured through CAG and PAC": accountability through the CAG and to parliament already exists and is itself in some ways dysfunctional. (Incidentally 'PAC' is surely a mistake for COPU.) All these recommendations are weakened by a failure to recognise longstanding and much-debated problems.

Turning to the restructuring of PEs, one can readily agree with the propositions that restructuring has to be guided by clear objectives, that a complete review of all PEs should be undertaken, that incurably sick PEs should be closed, and that the BIFR route is not the most appropriate one for dealing with sick PEs There is nothing new in all this.

The one interesting recommendation is the establishment of a 'Trust' for performing a variety of functions relating to PEs: analyses, monitoring, restructuring, deciding on revival/closure of sick PEs, managing the disinvestment process, administering the proceeds of disinvestment, disbursing funds for restructuring, managing the National Renewal Fund, etc. A number of questions arise. In the first place, is a Trust the most effective form of organisation for the purposes in view? The author envisages a statutory body: if so, should it not be a Commission? Secondly, the author recommends the transfer to such a body only of those PEs which are not to be retained in the public sector: but who will take that prior decision? Would it not be better to provide for the mandatory transfer of all PEs to the Trust/ Commission (if that is legally feasible)? Thirdly, should there be one Trust or Commission or several such bodies performing distinct functions? Fourthly, will the political difficulties involved in closure, exit policy, the restructuring of the labour force, etc, disappear merely because a statutory body is set up? Lastly, the National Renewal Fund is in principle supposed to cover both PEs and the private sector; should there be a separate PE Disinvestment Fund into which the disinvestment proceeds will go and from which resources will be made available for the restructuring/rehabilitation of PEs, and if so how can we ensure that it is not bureaucratised?

The purpose of that series of questions is not to throw cold water on the idea of establishing a statutory body or bodies to handle some of these matters. There is some merit in the idea and it deserves serious consideration. Unfortunately, as put forward in the book it is a nebulous proposition: much more work needs to be done to make it an operational recommendation.

It is a pity that having embarked on an ambitious undertaking, the author has failed to do justice to it. However, the book certainly provides an occasion for thinking about an important subject, and raises some at least of the major issues. Despite its inadequacies, it can serve a useful purpose and must therefore be welcomed.

Communalism and Indian Princely States

A Comparison with British India

Dick Kooiman

In the study of communalism, the colonial policy of separate electorates for religious minorities has often been put forward as a powerful explanatory factor. But a comparison of British India and the princely states of Baroda and Travancore, which had no separate electorates, suggests that such arrangements had less influence on the formation of communal identities than has generally been assumed. Rather, the demand for separate electorates may have been an effect rather than a cause of communalism.

THE problem of communalism looms large over present-day India. In the study of its emergence, the policy of the British colonial government to provide religious minorities with separate electorates has often been put forward as a powerful explanatory factor. This distribution of political privilege along lines of religion is alleged to have divided people into mutually exclusive, often hostile, if not openly fighting social groups, culminating in regular outbursts of communal violence.

Since these hotly disputed separate electorates were introduced only in the provinces under direct colonial rule, this study will make a comparison between constitutional developments in British India and those in two of the major indirectly administered areas, the princely states of Travancore and Baroda (Vadodara). These states continued a semi-autonomous existence till 1947 and were largely left free to make their own electoral arrangements, if they wanted to make any at all. In making this comparative analysis I hope to improve our understanding of the emergence of the communal problem and to place the colonial factor in a more proper perspective.[1]

Communities generally define themselves by drawing certain boundary lines demarcating their own community. In India these boundaries cross-cut and overlap one another in all possible ways. The culturally defined shared characteristics represent competing criteria and do not define one single group. Having more than one set identity, an individual can belong to several communities at the same time and may be mobilised along different, mutually exclusive lines of communal identity [Alavi and Harriss 1989:223; Shah 1994:1133]. Therefore a community is never a socially homogeneous unit. And there is more to it than that. In spite of sharing relevant common identity markers, the objective conditions of the people that make up a community may also be extremely dissimilar.

Nevertheless, the distinctive characteristic of the phenomenon called communalism is the belief that a group of people, because they have one ascriptive identity in common (religion, language, etc), also share common interests in all other fields (political, economic). By placing all emphasis on that shared cultural attribute, an earnest attempt is made to overcome a disturbing internal diversity by postulating a higher but largely 'imagined unity'.[2] Depending on the selection of attributes, the imagined unity may refer to the political community of a nation [Anderson 1983], but also to a religious, caste or linguistic community. Under colonialism, the religious definition of community has become so predominant that in common discourse communalism has become more or less synonymous with communalism of the religious variety.

Historiography of Communalism

Studying the question of how communal identities in south Asia could emerge and change into active and even virulent forms of communalism, two different forms of analysis can be distinguished, an approach from below and one from above. The analysis from below starts from the assumption of a continuing importance of primordial attachments among the people of India at the grass roots level. These attachments based on language, religion, place of origin and kinship connections are supposed to flow more or less naturally into modern communalism. A major objection to this essentialist interpretation is that it does not care to explain in what particular historical contexts these primordial sentiments become available for translation into political action. Apart from that, primordial identifications like religion and language are always subject to change and, as Brass (1991:73) has argued, may be constructed "after-the-fact, as it were".

The other school of analysis starts from above. It sees communalism and social self-identification as resulting from a deliberate manipulation of selected community symbols by an interested elite or as the outcome of mischievous colonial policies of divide-and-rule.

Speaking about communal riots after independence, specialists such as Dipankar Gupta and Asghar Ali Engineer also direct their criticisms primarily at the elite. They argue that the manifestation of communal tensions in Indian politics is not so much an outcome of popular grass roots passions, as it is a creation of vested political interests which try to identify their own aspirations as those of the entire community [Engineer 1984:34; Gupta 1991:573]. To further their ends the leadership is also said to take advantage of the growing economic and social disruption under the capitalist system. The problem with this approach is that it is heavily leader-oriented and does not seem to take religious feelings very seriously.

Stretching the discussion back to the pre-colonial period, Van der Veer (1994:30ff) draws attention to factors of the 'longue duree' in the construction and clash of communal identities. He emphasises the importance of pre-colonial modes of religious communication, like expanding saintly networks, ritual and pilgrimage which have been gaining new importance in (post-)colonial conditions.[3]

In this article I want to focus on the colonial period. Many historians working on this period have adopted a top down approach by trying to establish a direct connection between colonial policies and present-day religious communalism. Even if we accept that the massive state project to gather knowledge about India and its people was solely meant to facilitate the working of the administrative machinery, the result could be that communal distinctions became manifest and assumed political significance. From the 1870s the decennial census operations reinforced existing social divisions by creating a countable Hindu majority and Muslim minority. This colonial propensity for enumeration and classification became the basis of electoral, representative politics and introduced what I would like to call the tyranny of the numerical order.

Both Baroda and Travancore could boast of a proud record of educational achievement. In Baroda, the government had assumed direct responsibility for the establishment and management of a large school system. One of its most spectacular innovations was the introduction of compulsory education (1906).[6] Official efforts showed encouraging results and from 1891 to 1931 the rate of literacy rose from 8 to 21 per cent. In Travancore on the other hand, the government had entrusted the major part of education to private agencies, assisting them with a generous distribution of grants-in-aid. This policy enabled missionary societies to dominate the Travancore educational system, especially at the primary level. The number of schools was high and so was the rate of literacy. It increased from 10 per cent in 1891 to 30 per cent in 1931, stimulating a flourishing local press[7] and active political participation.

Both Baroda and Travancore state spent a large part of their revenue on education. But due to the prevailing social inequality, the benefit of education was very unevenly spread between men and women, high castes and low castes, Christians and Muslims. Nevertheless, literacy rates were much higher here than in the neighbouring Madras presidency or British Gujarat, which in 1931 had reached only 11 and 13 per cent [Census Baroda 1932 I:315, 334ff; Census Travancore 1932 I:56 and 1942 I:155, 159; BAR 1944-45:58).

A major difference between Baroda and Travancore, finally, concerned the economic conditions in both states. Partly by virtue of its favourable location on the main railway lines, the state of Baroda was drawn rather closely into the process of commodity production in neighbouring British India. This offered local merchant groups a suitable climate for profitable investment and participation in a wider market. Apart from that, the Baroda government became a zealous patron of industrial development and followed a liberal policy towards industry [Streefkerk 1985:48-49, 111-14]. In spite of all these efforts, almost until the early 1940s local industry was rather narrowly based, with textile mills accounting for the bulk of the labour force as well as invested capital. This local textile industry was almost exclusively controlled by a few leading firms from the Gujarat vania and patidar castes [Erdman 1971:6ff; Mahadevan 1991:165, 187].

The economy of Travancore had become more integrated with the international commodity market. European coastal firms, generously supported by the government, had made large-scale investments into plantations and agro-processing industries, exercising almost complete control over the principal spheres of commercial and financial activity. As a result, the Travancore economy had become "an essentially export-oriented agro-based industrial complex characterised by the overall predominance of foreign capital" [Mahadevan 1991:167]. This subordination was not particularly favourable to the growth of a well-developed entrepreneurial class. Local entrepreneurs, mainly from the Syrian Christian and ezhava communities, started investing in plantations and later also in commercial banking, but there was no large-scale investment in modern industry, most probably because local merchants and capitalists did not feel encouraged by official attitudes.[8]

Constitutional Developments in Baroda

In the constitutional set-up of Baroda the ruler was considered to be the fountainhead of all power, authority and justice in the state. The actual administration was delegated to a dewan and real power was vested in his hands and those of a small number of high officers. At the end of the 19th century a system of local administration was introduced, including the elective principle, meant to serve as the foundation for a larger representative framework. In 1908, as a natural sequel to the elaboration of these local boards and municipalities, a legislative council was inaugurated which was entrusted with the task "to advise His Highness' Government in the arduous task of legislation" [BAR 1907-1908:18].

"There has been a strong popular element in the council since its inception, and this idea tends to increase", the *Gazetteer of Baroda* (1923 II:242) observed with hardly concealed satisfaction. Of the nine non-official members, however, three were nominated by government to represent interests that might otherwise remain unrepresented, like Muslims and depressed classes, and the remaining six members were chosen by the district boards from among their own members. Neither did the new council have much of an effective influence. It may have been "endowed with potentialities of administrative power", as the dewan declared at its opening session [BAR 1907-1908: iii], but these potentialities remained as yet largely unused. All decisions were in the nature of respectful recommendations to the maharaja. In later years the total number of councillors was gradually raised but a more fundamental change in Baroda's legislative council had to wait for the Constitution of 1940.

There was hardly any echo of the Montagu-Chelmsford reforms to be registered in Baroda. In its reply to these reforms to the government of India the Baroda darbar only stressed matters like the preservation of the honour and dignity of the Indian princes. There was no reason for concern, after all, as the paramount power adhered to its policy of non-interference and raised a protective umbrella above the states to prevent them from democratic experiments that might not suit local traditions. As the *Manual of Instructions for Residents with Indian States* stipulated, it was not the policy of the paramount power to give open encouragement to the granting of representative institutions by the rulers to their people.[9]

In Baroda the constitution of the legislative council was not substantially changed. There was, however, one important amendment to the way members for the 10 general seats were elected. In 1928 the district boards were abolished and their prerogative to elect council members was transferred to the larger division boards on whose recommendation councillors were to be nominated by the government [BAR 1931-1932:20]. This means that the popular element in the council was not increased but weakened, as election made place for recommendation and the constituencies were farther removed from the people.

The four division boards were largely the domain of the patidars. These dominant Gujarati landed proprietors had utilised the new electoral opportunities by capturing through the ballot box more than their due share of seats. In 1931 patidars numbering one-fifth of the population held more than half the number of elective seats in these division boards [Census Baroda 1932 I:411]. Their complete command of the situation in the countryside can also be seen from the aborted 'satyagraha' in Petlad district. Hardiman, describing this satyagraha (1978:126ff) explains its failure by pointing at the structural alliance between government and landholders on which the Baroda state actually rested. State officials always showed extreme sensitivity to peasant demands, and peasant elites had more to gain from subtle dealings behind the scenes than from an outright confrontation. Therefore, the Petlad patidars had no need for Gandhian satyagraha, as it was a weapon of urban intellectuals who lacked influence in society.

Baroda offered a picture of overall political tranquillity these years. When in 1930 Gandhi launched his civil disobedience campaign from Sabarmati ashram, the national political movement came very near to Baroda's borders. The government of India was afraid that the movement might spill over to Baroda,[10] but there was hardly any manifestation of political unrest, apart from some movement among the students of Baroda College. In a different guise, but not less constructive, support for the nationalist cause came from the Baroda government itself. The maharaja was an enthusiastic supporter of Gandhi's swadeshi movement encouraging indigenous industries and his government provided local entrepreneurs with loans, tax concessions and transport facilities. Among those able to capitalise on these favourable conditions were relatives

or close associates of the Congress leaders Sardar Vallabhbhai Patel and Gandhi [Erdman 1971:7-12].

Nevertheless, the civil disobedience inspired the Baroda Praja Mandal to greater activity. The Mandal, a people's organisation founded in 1917 [Handa 1968:89], worked for the improvement of the conditions of all the state's people. In the 1930s its members toured the districts to preach the gospel of swadeshi and total prohibition When Sardar Patel became president of the Mandal, it became a more patidar-dominated body with a better chance of linking up with the peasantry of the state.[11] Yet, in spite of a growing influence of the Congress, the Mandal maintained a formal political independence and did its utmost to preserve good relations with the state authorities.

The Baroda police commissioner, a maratha, declared that the Indian National Congress had no support among the general populace. Yet, the British resident did not wish to be deceived. He reported a latent but strong sympathy for Congress and noted that the slogan 'Gujarat fo the Gujaratis', associated with Congress policies, was increasingly resented by maratha officials.[12] Under the old regime a Maharashtrian elite, following in the wake of the maharaja's conquests used to dominate the higher ranks of the administrative service. However, with the spread of education Gujaratis were increasingly claiming their share of official appointments. When in 1939 Patel visited Baroda city and touched upon the sensitive issue of Gujarati under-representation in the services,[13] large-scale violence broke out leaving many injured and one maratha killed.[14]

At the same time the Congress' attitude towards the princely states changed. Congress had always followed a policy of non-interference in states' affairs but in 1938 its session at Haripura, immediately adjoining Baroda territory, decided for the first time to support, at least to a certain extent, movements in the states asking for responsible government. In Baroda the change became immediately apparent in the political resolutions of the Baroda Praja Mandal. In August 1938 the Mehsana branch of the Mandal asked not only for the usual reduction in land revenue and total prohibition, but also for responsible government. Since then, the latter demand became a recurrent theme at Mandal meetings all over the state.[15]

After the old maharaja had passed away in 1939, his grandson and successor immediately declared to support the recommendations of a committee for constitutional reform instituted the previous year. With only slight alterations these recommendations found a place in the Government of Baroda Act of 1940. The act provided for a legislative assembly of 60 members. Of these, 23 members were nominated including representatives of minorities and backward communities, 10 members represented special interests like industry, commerce and labour, and the remaining 27 members were elected from territorial constituencies on a wide franchise, about 8.5 per cent of the population.[16]

The government declared to have given "most anxious consideration" to the question of communal representation. Still, it had decided to make no arrangements for separate electorates or seat reservation in view of the "identity of interests among the different classes of the people in the state and His Highness' government".[17] Commenting on this, the *Amrita Bazar Patrika* could write:

> The Indian nationalists have long been demanding such liberal reforms in their own constitution and they must congratulate the people of Baroda for getting them in advance.[18]

Less satisfactory to nationalist expectations both within and outside Baroda was the lack of any form of responsibility in government under the 1940 Act. The assembly was to advise on all legislative matters and the budget, but the executive council appointed by the maharaja remained responsible only to him.

As soon as the reform proposals had become known, the Praja Mandal under the presidentship of Sardar Patel heavily criticised them, especially for their complete lack of any reference to "responsibility in government remote or elementary" (*Bombay Chronicle*, March 7, 1939). But after the enactment of the new constitution the Mandal decided to accept it for what it was worth. An appeal was made to all the people of Baroda to vote for Mandal candidates, and at the 1940 elections the Mandal secured 24 elected seats in the new legislative assembly.

The Muslims in Baroda were less willing to work the reforms. From the appointment of the constitutional reform committee they had started worrying about their future place in Baroda society and in India in general. At local conferences resolutions were passed along the lines of Muslim League in British India demanding separate electorates in the new legislative assembly and all local bodies. The constitution of 1940 only reinforced existing fears among Muslims that they stood no chance of being elected to the assembly, and therefore they called upon their co-religionists to abstain from participation in the forthcoming elections.[19] Trade-union leaders and caste associations joined the chorus of those demanding more adequate representation,[20] but the assembly convened according to rule and the protesting communities gradually adjusted to the new arrangements.

Whereas in British India separate electorates were introduced as early as 1909 in Baroda nobody seemed to have cared to ask for them. Only on the eve of independence Muslims and a few other minority communities started to demand separate representation in defence of their political rights. Most relevant to our central problem is that communalism also was practically unheard of prior to 1947, which seems to confirm the assumed relationship between separate electorates and communal feeling. The Baroda Administration Report (1939-40:2) proudly stated that

> the spread of modern education ... is steadily softening the edges... of different faiths and the resulting broad sense of toleration reduces the chances of religious tension which was never acute in the state.

Unfortunately, the same statement recurs in earlier and later reports and its routine character clearly affects its credibility.

Nevertheless, the reports of the British residents also contribute to this picture of traditional communal harmony. Of course, one may doubt the diligence of the average British resident in writing his fortnightly and other reports on local political events. However, even after the government of India had expressly asked the residents in 1933 for timely intimation of any communal trouble that might arise in their states[21] the general thrust of the Baroda reports did not change. The only major trouble of a communal nature occurred in 1939 when there were riots in Baroda city between Gujarati and Marathi speakers. One might argue for a latent but powerful communal tension hidden somewhere below the social surface, but the conclusion must be that this tension never led to explosions serious enough to leave an imprint on the documentary evidence used for this study.

One of the few minor conflicts between Hindus and Muslims that were reported had to do with municipal elections at Sidhpur in the north of Baroda state. Significantly, the trouble started in a general constituency that had one Hindu and one Muslim candidate. Both parties were waiting for voters outside the polling booth and tried to persuade them to vote for their candidate, which led to an exchange of words, serious fighting and a number of people injured or arrested[22]. Separate electorates are said to harden religious distinctions into much broader antagonisms. Still, one might argue that a separate electorate offers no compelling need to appeal to religious sensibilities, as both voter and candidate move wothin the same social boundaries without rival communities competing for the same seats. On the other hand, in a general electorate candidates and their supporters may feel more easily tempted to invoke religious affiliations and to fight political opponents along lines of communal differentiation.

After independence, Baroda merged with British Gujarat and was integrated into the new Bombay state that later split into the

linguistic states of Gujarat and Maharashtra. The new constitution of India with its adult suffrage unqualified by anything like separate electorates could not save Gujarat from communalism It would have been too much to ask More and more cities and towns fell prey to communal violence and from 1956 Gujarat was plagued by a long series of violent incidents and movements. Wood (1984) has tried to differentiate British from princely legacies in post-independence Gujarat politics, but unfortunately he did not include communalism in his analysis The intricate territorial mingling of directly and indirectly ruled areas before 1947 would have made such an attempt extremely difficult Local observers agree, however, that the cities of Ahmedabad and Baroda, the old capitals of British Gujarat and the maharaja's state, both share the dubious honour of being the preferred habitat of communal violence, though of late Surat seems to outrival both of them [Shah 1984; Chandra 1993:1883; Lobo and D'Souza 1993:152; Breman 1993].

Constitutional Devlopments in Travancore

In Travancore also the maharaja was the source of all power and a representative institution could only come into being as a grant from the king to his people. In 1988 he granted them a small legislative council, followed in 1904 by a popular assembly. Whereas the council was meant for the making of laws and regulations [ATR 1887-88:1], the assembly had no legislative powers at all. It was primarily aimed at promoting good understanding between Travancore's many castes and religious communities whose growing antagonisms at that time already were causing the state much trouble.

Most of the assembly members were elected from territorial constituencies. There were no special electoral provisions for castes or religious communities, but the government carefully spread a number of nominated seats among ezhavas, Latin Catholics,[23] Muslims and other weaker sections of the population. The assembly also obtained the right to recommend, and thus indirectly elect, the non-official members of the legislative council [Koshy 1972:18] Soon after the institution of council and assembly the maharaja received petitions from several communities, particularly the Syrian Christians, who complained of under-reprsentation in these bodies.

After completion of the Montegu-Chelmsford report the Travancore government expressed a warning that the political relationship between the government of India and the princes "should remain unaffected by the constitutional changes contemplated in British India" [24] There was not the slightest reason for uneasiness, and Travancore used its relative freedom to remodel its legislative council till it got its final shape in 1921. The dewan had informed the British resident that the political reforms were to follow the lines adopted in British India,[25] but the Travancore council had considerably less power than the Montford councils in British India The most important difference was the absence of any provision for communal electorates or seat reservation The only comfort for communuities who felt unjustly deprived of representation was the possibility that the government might nominate one of their members to the remaining seats [ATR 1921-22:39; TPPP 1934: Chap I]. The assembly lost its right to recommend members for the council and, without legislative powers or constitutional basis, it faded into oblivion.

As the franchise qualification was mainly based on landed property, it was especially favourable to a community like the nayars who were evenly spread over much of the state. The Syrians, actively involved in plantations and banking business, were concentrated in a few divisions and could count on getting only a small number of seats. Other large groups like the ezhavas, Muslims and depressed classes could hardly hope to get representation at all. In consequence, the legislative council after 1921 was controlled by the nayars who numbered 16 per cent of the population but held the large majority of elected seats. This glaring imbalance in political participation was greatly resented by leaders from the under-represented communities who started to mobilise protest against this unequal opportunity structure by appealing to ascriptive identities of caste and religion.

In response to the growing agitation for legislative reform, the Travancore government decided to publish the main outlines of its reform proposals meant "to secure adequate representation of all interests" (June 1932).[26] As these proposals did not allude to any communal safeguards, ezhavas, Muslims and different Christian sects immediately forwarded their claims for representation in the legislative bodies, commensurate with their numerical strength in the population. To achieve that purpose they demanded separate electorates or at least reserved seats and, in case adult franchise was impossible, a widening of the existing franchise so as to guarantee proportional representation. Their main argument was that in the prevailing conditions in the state a community which had not its own champions in the representative institutions could hardly hope to get its claims satisfied [HFMK 1972:II 334ff; TPPP 1934:4; Chiriyankandath 1985:224].

The constitutional reforms announced a few months later fell far short of these political aspirations. The government made it perfectly clear that it considered separate electorates and even reserved seats to be unsuited to conditions in Travancore. Such measures were thought to contribute only to the creation and multiplication of existing communal cleavages and to the promotion of sectional interests, endangering the larger interests of the state. In its stead the government preferred direct election combined with the compensatory principle of nomination.

The reforms introduced a bicameral system consisting of an assembly (72 members) and state council (37 members). Of the 62 non-official assembly members 43 were elected by general constituencies and five by special constituencies representing planning, commerce and industry. Fourteen seats were reserved for the nomination of members from communities who were considered unable to secure adequate representation by general election A similar arrangement applied to the council. The number of those enfranchised was only about 3 per cent of the population, which was hardly an increase compared to the 1921 reforms [TPPP 1934: Appendix 64ff]. As far as powers were concerned, both houses could initiate and pass legislation, but they had no control over the executive which remained firmly vested in the sole authority of the dewan

When these reforms became known, communal organisations of Christians, ezhavas and Muslims held a large number of protest meetings Realising that their interests might be better served by joining forces, their leaders established a Joint Political Conference (December 1932). The demand for communal electorates was dropped but the JPC argued instead with increased vigour for reservation of seats in joint electorates (or multi-member constituencies) for the major communities in proportion to their share in the population. Some weeks later representatives of the constituent organisations of the JPC met again and passed the important abstention resolution, saying that the Christian, ezhava and Muslim communities should abstain from taking any part in the forthcoming elections so long as government did not

> make provision for the representation by election of all considerable communities proportionate to their populations in the Legislature [TPPP 1934:36-37; HFMK II 1972:343-45].

In a few long letters exchanged immediately aftr the start of the abstention movement the different positions were clearly marked out. The government rejected the reservation of seats to all communities in the state, including brahmins and nayars, as a contradiction in terms having no counterpart anywhere else. The JPC stipulated in reply that in the case of the nayars, reservation was actually meant not to protect but to prevent that community's long-standing but undue predominance in the legislative bodies. The government also

said to fear that the reservation of seats would only increase communal bitterness and hinder the growth of popular parties on political lines The JPC, on the other hand, contended that the reforms proposed by the government actually placed all other communities under the dominance of one group, the nayars, and that this unequal distribution of power was the basic cause of the present intensification of communal strife. The subsequent elections of 1933 turned out to be a poor show, and the British resident reported grudgingly that the abstentionist movement had achieved a considerable measure of success.[27]

In another field the communities behind the abstention movement were more successful: in 1935 the government accepted the principle of communal reservation in recruitment to the various classes of the administrative services. The new rules recognised eight Hindu caste groups, the Muslims and six Christian denominations as officially entitled to a fixed share of all appointments based on a mixture of efficiency and communal considerations. Yet, it was not long before the under-represented communities started to complain that most of the key positions were still falling to brahmins, nayars and the more established Jacobite Syrians.[28]

The inauguration of provincial autonomy in British India (1935) strengthened a similar urge for more responsible forms of government in the states. In the same year the government of Travancore decided to reconsider the thorny question of the revision of the electorates in order to bring about a just and equitable representation in the legislature.[29] In a public statement the government explained that it could not conceive of a legislature in which the elected seats were parcelled out in strictly mathematical proportions among no less than 12 to 14 communities, as had been done shortly before in the administrative services. Therefore, the major contingent of seats remained to be filled in open competition which would involve a trial of strength between the major rivals, the nayars and the Syrian Christians. Communities who were small or backward, though, would continue to have their interests served by the door of nomination. Furthermore, the government expressed willingness to introduce seat reservation for those communities who were numerically strong and politically conscious and yet by the manner of the distribution of their population in the state were unable to command a majority in any constituency.

Following these broad guidelines, ezhavas, Muslims and Latin Catholics lost virtually all their nominated seats in the assembly and council to weaker communities like scheduled castes and Protestant Christians. Because of their geographical distribution, even universal suffrage would not have helped ezhavas and the others in securing the minimum number of seats in both houses as promised under the reforms. To ensure them that minimum it would have been necessary either to take recourse to the principle of separate electorates or to reserve them seats in multi-member constituencies. The Travancore government, supported by the British resident, was definitely of the opinion that the second possibility was 'less objectionable'. Therefore, it decided to grant ezhavas, Muslims and Latin Catholics a large number of reserved seats (18) in general constituencies and appointed a commissioner for franchise and delimitation to make, in line with these general considerations, detailed proposals regarding the delimitation of constituencies.[30]

One year later the commissioner submitted his report. On the strength of his recommendations the government passed orders (August 1936) dissolving the 43 existing electoral divisions and dividing the state into 17 new multi-member constituencies returning 43 members to the assembly, and 10 similar divisions returning 16 members to the council. These multi-member joint electorates included 18 seats having a reserved qualification In constituencies returning only one member no reservation was made The enfranchised percentage of the population was raised to 10-12, a proportion similar to that in British India following the Government of India Act.[31]

Although no definite assurances were given to all of the many Christian sections, the supporters of the abstention movement reacted favourably. At least a large part of their demands were conceded. The delimitation of the new constituencies was such that, in view of their voting strength, 10 of the 29 generally elected assembly seats were likely to go to the nayars, 10 to the Syrian Christians and four to other Hindu castes, leaving only five seats for really open competition. This meant that especially the nayars, who till then had controlled most of the elected seats, had to face a painful loss of influence, which they accepted, at least for the moment, "with remarkable good grace".[32] Deputations by nayars, who after having had second thoughts came to the dewan to vent their misgivings over the recent electoral reforms, were set at ease by the assurance that, in case the new regulations would not give them an equal opportunity for self-expression, the government would not be party to perpetuating that kind of injustice.[33]

The 1937 elections took place in a quiet atmosphere that was free of the more extreme manifestations of communal tension. The JPC captured 25 of the 48 elected seats in the new assembly and became the largest single party. The protected communities gratefully secured their reserved seats and both nayars and Syrian Christians succeeded in sending 12 of their number to the assembly. However, there was no change in the constitutional set-up of the state. Whereas in the provinces of British India responsible ministries were being formed, in Travancore the executive powers remained firmly in the hands of the maharaja and his dewan, Sir C P Ramaswami Aiyar. Therefore, the new demand that was raised was for the introduction of responsible government.

In defence of his autocratic rule the dewan took the position that a devolution of political responsibility was impossible in view of the existing treaty obligations of the maharaja to the paramount power. His statement raised a storm of protest, but a definite answer came across the seas: the British government declared in the house of commons that "the Paramount Power would certainly not obstruct proposals for constitutional advance initiated by a Ruler" [quoted in Ouwerkerk 1994:128].

What followed was a civil disobedience campaign that was full of bitterness and personal recriminations, but in the end the dewan managed to hold its own. The campaign only deepened the existing hostility between the dewan and the Syrian Christians. During the civil disobedience their largest bank, the Travancore National and Quilon Bank, went into liquidation There were strong suspicions that this bank crash was orchestrated by the dewan, as the bank managers, two Syrian Christian businessmen, had incurred official displeasure by supporting the local opposition movement It may serve as an additional explanation why local capital shied away from large-scale investments in the economy of the state.

Neither was responsible government drawn any nearer to a first stage of realistion by the civil disobedience campaign. The maharaja's government was definitely of the opinion that the recent constitutional reforms presented the maximum that could safely and properly be given in Travancore at that time. It pointed out that the state's subjects now enjoyed practically the same constitutional advantages which British Indians enjoyed under the Montford reforms. Tacitly, it took for granted that political developments in Travancore were lagging more than 20 years behind those in British India.

Speaking about the British provinces, separate electorates were introduced as early as 1909 and there was no great struggle needed to get these communal claims conceded. They were granted with suspicious ease. In Travancore on the other hand, no separate electorates were ever granted, although several communities joined in a desperate campaign to wrest them from a reluctant government. Yet, in spite of the important fact that no separate electorates

were ever introduced, we have seen that there were fierce communal rivalries, not only in the field of political representation but also in that of government employment, right from the beginning of this century. The reports of the British residents abound with complaints that the population was "unhappily stricken with the plague of communal animosities" and that communalism had intruded into every government department.[14] The dewan, Sir C PRamaswami Aiyar, was even of the opinion that people in Travancore were much more inclined to think and act in terms of a specific communal identity than was usual in British India[15] and, it might be added he made clever use of it.[16] Therefore, Travancore presents us with a case of widespread communalism without any separate electoral arrangement, a position somewhere between British India and Baroda.

When the Indian Independence Act of 1947 released Travancore from all its obligations to the British crown, it was first merged with the state of Cochin and later, together with the British district of Malabar, incorporated into the new Malayalam-speaking state of Kerala. This new state has been more or less free from the violent communal outbursts that have plagued large parts of northern India. Nevertheless, less overt but deeply ingrained, Kerala politics are marked by community-based political parties and vote-banks. Some scholars contend that Kerala politics should be understood as the extension of caste and religion to the public domain.[17] Over the past few years Kerala has become a fresh recruiting ground for the Rashtriya Sevak Sangh (RSS), a communalist party which has established powerful strongholds especially in Trivandrum, the former capital of Travancore. These manifestations of communalism in the new Kerala state do not come as a complete surprise. They may be seen as a continuation of the tensions and conflicts that have plagued Kerala, particularly the former Travancore part of it, for a much longer time.

Baroda and Travancore Compared

A question that remains to be answered is why there was such a striking difference in communal relations between the states of Baroda and Travancore in the period before independence. And how can we explain the emergence of communalism in Travancore, if there is no government to be blamed for dividing the people by separate electoral arrangements? I will try to answer these questions in the final sections of this article.

One of the main features that sets Travancore society clearly apart from the situation in Baroda is the large number of Christians living in this state. When in the 18th century Travancore rose as the single-most powerful force on this coast, it was the Syrian Christians who joined the nayars in the centre of the new political order. As Susan Bayly (1989) has shown, they proved to be trusted allies of the state as commercial agents, warriors and office-holders. In the 19th century this political system collapsed under the restrictions imposed by British paramountcy, and as part of the resulting disintegration the Syrians lost much of their privileged position. Supported by British residents and Christian missionaries, who mistook Syrian decline as caused by age-long heathen oppression, they were able to exploit the new opportunities and emerged as the state's most literate and enterprising community. Nonetheless, as non-Hindus they became ritually excluded from the most important offices of the state. Their presence as a socio-economic elite without political power offered fertile ground for communal leaders to build upon.

With a variation on the sanskritisation model, one may say that Syrians fitted a 'participation model'. Resenting their lack of influence, it were mainly, though not exclusively, leaders from the various Syrian sections who attempted to translate educational and economic achievement into political participation and status. Their demands found no favourable response from the Travancore government. From the 19th century census figures show a steady increase in the number of Christians in the state. This increase was almost exclusively due to an inflow of converts from the lower Hindu ranks to Latin Catholicism and Protestantism, but it created an atmosphere of distrust and fear that (Syrian) Christians were going to take over the kingdom Therefore, the government was not inclined to offer concessions. Whereas in British India electoral safeguards to Muslims might help to maintain the empire, in Travancore political concessions to Syrians, the most prominent Christian community, were viewed as threatening the kingdom that became increasingly connected with Hindu orthodoxy.

In a princely state like Travancore, popular participation stood much higher on the political agenda than national liberation. Since the late 19th century nayars had been able to monopolise the key positions in the centre of power alongside the small group of foreign brahmins. Their preponderance in the state's representative institutions and administrative services was threatened by other aspiring groups, first the Syrian Christians and later also the ezhavas and the Muslims. Their leaders appealed to communal identities and interests to strengthen their own demand for a redistribution of political privilege within an already largely Indian bureaucracy. In British India, the government granting separate electorates could pose as an impartial arbiter between warring communities and at the same time serve its imperial interests by a selective conferment of political rights on deserving communities. In Travancore, with only a handful of British officials, the administration itself had become the property of a few high castes who were the maharaja's most loyal supporters, and here the struggle for power assumed almost inevitably a more directly communal character.

In Baroda local elite groups had much less reason to mobilise for opposition against the government. Whereas in British India, and partly so in Travancore, the landowning peasantry had very little say in the administration, the patidar peasant elite in Baroda could act as effective leaders of their communities as Hardiman (1978) has pointed out, they were well represented in the state bureaucracy which looked adequately after their interests. What was still more important, the government proved most eager to comply with their wishes, as it could ill afford to lose their support. Apart from that, patidars occupied the best part of all seats in the local bodies, especially the division boards, which from 1931 had the right to select members for nomination to the legislative council. Therefore, the peasant elite was well-entrenched inside the bastion of power and had no need for communal agitation to press for more democratic systems of government. Demands for more representative institutions came chiefly from a select circle of urban intellectuals which the government of Baroda chose to ignore

The same contrast in political behaviour may be observed between the economic middle class in Travancore and Baroda Travancore, with its extensive potential for plantation development, welcomed foreign capital which soon dominated the principal spheres of commercial and financial activity. The local entrepreneurial classes, largely composed of Syrian Christians and a few ezhavas, could not depend upon a similar preferential treatment on the part of the government and had to compete with the European coastal firms on very unequal terms. They felt thwarted in their efforts by their own state, which they perceived as one of the main obstacles on their way to economic progress. It is true that local capitalists were gradually able to extend their influence in the estate economy, primarily in rubber, but they had to fight their way up all alone. An appeal to a separate communal identity and organisation, partly reflective of class interests, was an obvious method to get their voices heard in the right places and to wrest concessions from an un-cooperative government.

In Baroda, on the other hand, the government was very active in creating conditions that were favourable for the emergence of local industry. Vanias and

some patidars were quick to

even though many results at first were rather disappointing, economic life was overwhelmingly dominated by 'home-grown' industrialists. These merchants and industrialists saw the state as their chief ally and were as a result not inclined to challenge government policies. Erdman (1971:7) observes that in the 1960s some of Baroda's older industrialists were still looking back somewhat nostalgically on the good old days of princely rule. This feeling of contentment offered barren ground for political opposition, communal or otherwise. Those industrialists who associated with the Praja Mandal generally pressed for caution and emphasised the importance of good relations with the administration.

Finally, there may have been no separate electorates in Travancore, but the specific delimitation of constituencies introduced in 1936 had an inherent need to mobilise sentiments of religion and caste. Yielding to strong pressure from the opposition, the government decided to delimit the constituencies in such a way that major communities like Syrians and nayars might gain a number of seats commensurate to their population ratio, if only all Syrians and nayars in their respective majority constituencies, would vote for a candidate from their own community. The results of the 1937 elections proved that this message was not lost on the enfranchised members of these communities. Maybe, we touch here on one of the major reasons for the prevailing communalism in this part of India: this specific delimitation of constituencies enabled political leaders to build their own communal vote-banks as a kind of informal separate domain.

Political Retardation

Finally, there is another matter that should be taken into consideration. Demands for political participation grew in force especially at times when new positions of power and influence became available. The report of the Indian statutory commission, speaking about British India, did not merely explain Hindu-Muslim tension away by the usual reference to "religious practices which are only too likely to provoke mutual ill-feeling [ISC I 1930:26]. It also pointed at a deeper cause: so long as people had no part in the conduct of their own government, there was little for members of one community to fear from the predominance of the other. The gradual introduction of constitutional reforms, however, greatly stimulated communal tension as it aroused anxieties and ambitions among many communities by the prospect of their place in India's future political set-up [ISC I 1930:29].

The observation that a devolution of political power, however modest, might arouse communal tension should not be confined to British India. It also applied to the princely states. As we have seen in the case of Travancore, the mere announcement of political reform in 1932 sparked off a wave of communal unrest. The relative progressive pattern of socio-economic development in this Indian state had given rise to great expectations of political participation. The resentment harboured by groups who felt left out, still reinforced by large-scale, educated unemployment, created a climate suitable to the rise of communal animosities.

The same happened in Baroda when in 1939 the government announced its intention to implement recommendations for the expansion of the legislature. It was to be the first major instalment of constitutional reform since the establishment of the legislative council in 1908 and promised a significant increase in popular influence by having almost half the membership directly elected by general constituencies. When these recommendations became known, Muslim leaders in Baroda for the first time raised the demand for separate electorates to protect the interests of what they called their endangered community. The fear that they might not get fair share of power, later compounded by the prospect of being lost in a larger Indian union, led to an upsurge of religious communalism where there was none to be found before.

Conclusion

The main conclusion to be drawn from this brief study seems to be that separate electoral arrangements for religious groups or castes had less influence on the formation of communal identities than has generally been assumed. One step further and maybe more provoking, I would like to argue that in the emergence of communalism separate electorates as well as the demand for them may have been an effect rather than a cause. Both Baroda and Travancore had important elite groups in agriculture, commerce and industry. But in Baroda, the landowning and industrial elite was well represented in the administration and the legislature, and its interests were well served by a sympathetic government. In Travancore on the other hand, an important part of the elite was not so favourably situated, and in its fight for political power and status it had to deal with a government that was much less co-operative and mainly in the hands of a rival elite. This situation meant a clear invitation for those leaders who felt excluded from privilege to press their demands by mobilising their own community and stressing their separate identity. Here, separate electorates were not an instrument in the hands of the government to weaken the ranks of the opposition, but were eagerly sought after by the underprivileged communities themselves as an important means to wrest a minimum number of council seats from a reluctant government

Notes

1 I would like to thank Gita Bajpai of the history department of M S University, Baroda for the opportunity to discuss my preliminary findings with her staff and students. A more elaborate version of the argument presented here can be found in my book *Communities and Electorates* (1995).

2 Here I follow the definition of communalism as given in the work of Bipan Chandra (1984; 1988 398ff). More recent research by Ghanshyam Shah confirms the validity and usefulness of this definition. In a survey carried out by him in Surat during the summer of 1993, about 525 people were asked about communal divisions and related issues. Except for a small minority of 3 per cent, all subscribed to the view that members of the same 'quam' (caste or religious community) have common socio-economic interests, even though (maybe characteristically!) most of them were vague as to what these common interests actually meant [Shah 1994:1136-37].

3 A conclusion pointing in the same direction was reached in a recent issue of *Afrika Focus*. Papers collected in this special issue question the assumption that ethnicity is a colonial creation imposed upon Africans from outside and contend that in the current discussion on the dynamics of ethnicity in Africa the formative influence of the colonial state is overestimated. In correction of this view the contributors emphasise the continuity with pre-colonial processes of group formation and argue that many ethnic groups in Africa had formed before the advent of the colonial state [Schilder and Van Binsbergen 1993, 3, 7-8].

4 Statement by secretary of state for India in the house of commons (1919), quoted in letter from government of India, foreign and political department, dated July 10, 1919, in OIOC, R/2(883/136).

5 At first the foreign department was responsible both for foreign affairs and relations with the princely states. By the beginning of the 20th century, when the burden of work became too much for a solitary departmental secretary, a political department was created (1914) within the foreign and political department to take charge of relations with the states. Only under the 1935 Government of India Act the political department became a separate and independent office.

6 The *Gazetteer of the Baroda State* (II 1923:311ff) contains an interesting description of the many practical problems involved in the introduction of compulsory education in an agrarian society accustomed for ages to use its children in the fields, and the administration by local authorities of the penalty system for offenders under the act.

7 According to Handa (1968:65, 126) there was not a single independent paper appearing from any of the states, no liberty of the press and no freedom of expression. This statement is certainly not true for Travancore where in

the 1930s over a hundred dailies and weeklies were printed and circulated, even though they were always in danger of having their licences cancelled and their presses attached As Ouwerkerk (1994 65) observes, Travancoreans were a nation of newspaper readers (and hearers) who early developed the art of agitation through the press

8 Isaac and Tharakan (1986) argue that Syrian Christians, who had both the potential and capacity to assume entrepreneurial roles, were prevented from investing in modern industry by the discriminatory policy of the state. Mahadevan (1991) tries to reduce this overemphasis on the attitude of the state as an explanatory factor

9 Note by political department (P J Patrick) on representative institutions of government in Indian states, 1929, in OIOC, L/P and S/13/886

10 Correspondence between government of India, foreign and political department, and resident of Baroda 1930-1931, in OIOC, L/P and S/1007

11 Fortnightly reports from Baroda for these years in OIOC, L/P and S/13/1007, *United India and Indian States*, August 16, 1930, Hardiman 1978 129 30.

12 Fortnightly report from Baroda for the second half of February 1932, in OIOC, L/P and S/13/1007

13 The census figures, for all their shortcomings, showed that after a prolonged decline the Marathi share of top level appointments was indeed on the increase from 17 per cent in 1921 to 24 per cent in 1931, but this growth was largely achieved at the cost of the Muslims, and the share of Gujarati Hindus and Jains had remained stationary at 62 5 per cent (Census Baroda 1921 II 114-21 and 1932 II 78-83)

14 The dewan's report in HPO, Confidential File no 134, was copied almost verbatim in the resident's fortnightly report from Baroda for the second half of January 1939, in OIOC R/1/1/3394 Whereas the *London Times* of January 26, 1939 reported that in Baroda "a new form of communalism" had come up between people from different provinces, the 1979 Vadodara district gazetteer observes that the hostile reception of the sardar revealed "the anti-national attitude of the state" (*Gazetteers, Gujarat State, Vadodara District* 1979:137). The 1979 gazetteer wrongly dates these events in February 1939.

Impact of Institutional Change on Productivity in a Small-Farm Economy

Case of Rural West Bengal

Badal Mukherji
Swapna Mukhopadhyay

West Bengal is the only state in India which has for the last nearly two decades been operating a system of democratically elected local self-government. It is also the one state which has successfully carried out certain land reform measures. This paper attempts to estimate the impact of these institutional changes on total factor productivity in the production of rice in the state.

I
Introduction

ONE of the major factors behind the persistence of rural poverty in developing countries can be traced to the low productivity of labour on small and marginal farms on account of a variety of reasons. Lack of access to complementary inputs, insecurity of tenancy and dependence on the rural rich in a situation of asymmetric power relations and interlinked factor markets all militate against achieving a high level of productivity on small and marginal farms. Yet as the size-productivity debate in Indian agriculture has clearly established, productivity on small farms may in fact be higher if one could net out the impact of factors of production other than labour.[1]

In other words, low land productivity on small farms is more a reflection of constraints other than just farm size. The state of West Bengal in India provides an interesting case study of what a small-farm rural economy can possibly achieve if some of these constraints could be even partially lifted. This has happened through the institution of the Panchayati Raj – a three-tier system of elected representatives entrusted with the task of decentralised planning and rural development. The purpose of this paper is to measure the impact of this institutional factor on growth in rice production in the state.

In recent years, West Bengal has emerged as the largest rice producing state in India. Compound annual growth rate of production which was around 1.1 per cent between 1970-71 and 1980-81 has shot up to 4.8 per cent in the 1980s. About three-fourths of this growth can be attributed to growth in yield, while area expansion, especially through growth in multiple cropping, explains the rest. Rice being the single most important crop comprising over 90 per cent of total foodgrains production in the state, this clearly suggests that the rural economy has had a shot in the arm in recent years.

The interesting thing about this phenomenal growth in output is that it is difficult to figure out simply by looking at the statistics on input use exactly what could have spurred this growth. The data do not suggest a corresponding increase in factor use on a similar scale as in output growth. The extent of farm mechanisation has been minimal in the state and has shown no massive increase in recent times. The state accounts for less than 2 per cent of all registered tractors in the country. Area under HYV seeds is as yet lower than the country average, although much of the increase in gross cropped area has occurred under Boro rice, which is a HYV crop. Fertiliser consumption, while increasing at a reasonably fast pace, was only 81.7 kg per hectare as of 1989-90, and is still much lower than the corresponding figures for most other major rice producing states in the country like Andhra Pradesh at 131.1 kg per hectare or Punjab at 158.6 kg per hectare. Although use of minor irrigation, especially shallow tubewells, to meet complementary water requirements does show a sharp upward swing in recent years, as late as in 1991-92, the state had barely 1 per cent of the total energised pumpsets in the country. Judging from the fact that as of 1991-92, barely 3.2 per cent of the total power use in the state of West Bengal took place in the agricultural sector, as compared to 35.6 per cent in Andhra or 39.8 per cent in Punjab, it is clear that production in the agricultural sector is as yet much less power-intensive than in some other rice producing states which have had a record of steady growth in rice production. The picture that emerges suggests the image of a small farm economy where the number of farms with 10 acres of land or more has in fact declined very sharply, not merely in relative but also in absolute terms over the last 15 years, and the average size of holdings has steadily declined to a level which currently stands much below the country average. This process took place during a period when the average size of holding had actually increased in a state like Punjab by over 35 per cent and the number of large farms with 10 acres and above had shot up in states like Andhra Pradesh or Orissa.

However one change that has taken place in rural West Bengal which has not happened anywhere else in the country so far has been the advent of the institution of democratically elected local bodies down to the village level for the formulation and implementation of local level plans. It is the only state which has had a record of nearly 15 years of uninterrupted local level elections since the late 1970s when the current state government came into power. In the early years of its rule, the Left Front government started implementing certain land reform measures which aimed, among other things, to render a degree of tenurial security to share croppers by registering their names in order to prevent wilful eviction by big landlords or 'jotedars'. A determined effort has been made in the country-side to project the image of the ruling party as a propagator of policies benefiting the small farmer, through political campaigning and other kinds of conscientisation processes. Elections to the three tier bodies called the Panchayats have been held every five years since 1978. The fourth one is scheduled for May 1993.[2]

In this paper we make an attempt to estimate the impact of these institutional changes on total factor productivity in the production of rice in the state. The next section lays out the model and the data used for the estimation, followed by a section on the results. The last section concludes and summarises.

II
The Model and Data

For estimating total factor productivity in the rice economy of the state we have used the trans-log variable cost function. The rationale behind using a variable rather than a total cost function stems from the argument that the assumption of instantaneous adjustments in the use of some factors, especially capital, is particularly unwarranted in the analysis of agricultural

productivity, which is usually marked by substantial year-to-year fluctuations. Thus, capital is treated as a quasi-fixed factor in our model.[4]

The basic trans-log variable cost function with a single output, three inputs, one quasi-fixed factor, and a quadratic time variable is as follows.

$$\ln VC = \alpha_0 + \alpha_y \ln Y + \alpha_k \ln K + \sum_{i=1}^{3} \beta_i \ln P_i + \tfrac{1}{2}\delta_{yy} (\ln Y)^2 + \tfrac{1}{2}\delta_{kk} (\ln K)^2 + \sum_{i=1}^{3}\sum_{j=1}^{3} \gamma_{ij} \ln P_i \ln P_j + \sum_{i=1}^{3} \rho_{yi} \ln Y \ln P_i + \sum_{i=1}^{3} \rho_{ki} \ln K \ln P + \theta_{ky} \ln K \ln Y + \gamma_t t + \tfrac{1}{2}\gamma_{tt} t^2 \quad ...(1)$$

where VC is variable cost per unit of output, Y is level of output, K is the quasi-fixed factor, P_i s are the input price indices and t is the time variable.

To test for a structural break in the post-panchayat years we used a dummy variable D such that D = 1 for post-panchayat years in the state of West Bengal and D = 0 otherwise.

The dummy is allowed to interact with output and capital variables over and above operating as a shift parameter for the intercept term. The variable cost function with the dummy stands as follows.

$$\ln VC = \alpha_0 + \alpha_D D + \alpha_y \ln Y + \alpha_{Dy} D \ln Y + \alpha_k \ln K + \alpha_{Dk} D \ln K + \sum_{i=1}^{3} \beta_i \ln P_i + \tfrac{1}{2}\delta_{yy} (\ln Y)^2 + \tfrac{1}{2}\delta_{kk} (\ln K)^2 + \sum_{i=1}^{3} \rho_{ki} \ln K \ln t + \theta_{ky} \ln K \ln Y + \gamma_t t + \tfrac{1}{2}\gamma_{tt} t^2 \quad ...(2)$$

Of the 29 parameters to be estimated in the above equation, 3 can be dropped without any loss of generality by imposing symmetry on the γ_{ij} coefficients. Also the condition of linear homogeneity in input prices can be shown to translate to the following parameter restrictions:

$$\sum_i \beta_i = 1, \sum_i \gamma_{ij} = 0 \ \forall\ j,$$

and $\rho_{ki} + \rho_{yi} = 0 \ \forall\ i$.

The variable cost function (2) above has been estimated along with two of the three cost share equations

$$P_i X_i / VC = S_i = \beta_i + \sum_{j=1}^{3} \gamma_{ij} \ln P_j + \rho_{yi} \ln Y + \rho_{ki} \ln K_i; \quad i = 1,2,3... \quad (3)$$

Estimation has been carried out using Zellner's technique of estimating seemingly unrelated regression equations.[5]

The major source of data for the exercise is the 1991 government of India publication titled, "Cost of Cultivation of Principal Crops in India". This provides detailed state level cropwise data on itemised cost figures aggregated over household level information on various cost categories, as well as input use data from crop cutting experiments in all the major states of the country since the early 1970s.

To handle the degrees of freedom problem we have used time series data on cost of cultivation of rice in nine major rice producing states in the country supplemented by similar information obtained from other sources for later years for some of the states. Thus the sample utilised for estimation is a cross section of time series data (cf Appendix). The coefficient estimates derived from this matrix of observations have been evaluated at sample means of West Bengal state figures to arrive at the estimates of total factor productivity of rice in the pre- and post-panchayat years in the state.

There are several cost estimates provided in the cost of cultivation data depending on whether specific items of cost are included or not (Appendix). Our variable cost figures are calculated by using the COC estimates to include all items of variable costs as well as imputed value of family labour but excluding interest on fixed capital and imputed value of owned land. The three input prices P_1, P_2 and P_3 are derived from the COC data to represent price of human labour, price of animal labour and a weighted price index for the composite input of seeds, fertilisers and manure respectively. Output is measured as yield per hectare of paddy.

We have two indices of fixed capital. The first of these is computed from the Central Statistical Office annual time series estimates of value of agricultural capital in the country as a whole and the value of agricultural output in the states. Assuming constant capital/output ratios across the states every year, a series on the value of agricultural capital was generated for all the states in the sample. Our first index of capital is based on the matrix of agricultural capital thus generated by setting the overall country average for 1980-81 equal to 100. Our second capital index is derived by adding the COC data on interest on fixed capital with depreciation estimates. This is used as a surrogate for fixed capital. The index is developed as before by setting the sample average for 1980-81 = 100.

III
Results

A number of versions of the equation system 2 and 3 were estimated using the Seemingly Unrelated Regression Technique, with and without the quadratic term in the time variable, and with alternative capital indices. Results appear to be sharper when we use the second capital index rather than the first one which we had constructed from the CSO data. It may be recalled that this index was constructed under the assumption of identical capital/output ratios across the states. However, part of the anomaly in the growth of agricultural output in post-panchayat West Bengal has precisely been that production seemed to have gone up in spite of no commensurate rise in input use - specifically, no corresponding increase in agricultural capital. Thus the assumption of identical capital/output ratio that we had to make to construct the capital variable since no time series statewise data on value of agricultural capital exist, would *inter alia* partially defeat the very purpose for which it has been constructed. To our mind this explains the comparatively weaker

performance of the first capital index. Tables 1 and 2 provide estimates of a translog variable cost functions obtained on a sample of 102 observations with and without a quadratic term in time with the second capital index. Below we present results using a linear and a quadratic time variable with the second capital index.

The all important shift parameter D1 has a t-value almost equal to 2. It has to be kept in mind while interpreting this result what the model has required this variable to do. The data sample covers all the major rice-producing states with huge variations in the quality of state level data. We have per force pulled this data and, with prior knowledge of a structural break in exactly one of the states, have required the latter to explain the variation in the entire data set. Under the circumstances, therefore, we feel that the estimate with a quadratic time trend (Table 2) has performed reasonably well. We reiterate the point that within the time period under consideration there has been no report of any technological or institutional break in any other state of the economy.

There are two ways of measuring total factor productivity using a cost function, which can be shown to be equivalent if and only if there are constant returns to scale. The alternative ways of measuring total factor productivity can be defined as either the growth rate of output over time when all inputs are held constant, or the common rate at which all inputs can be decreased over time-keeping the output constant. The returns to scale parameter is the ratio of the first measure to the second. In the case of variable cost functions, each of these measures needs to be corrected for the effect on the elasticity estimates of the presence of the fixed factor which enters the cost function symetrically with the output variable. The formulae for alternative measures of total factor productivity and the returns to scale parameter derived from a variable cost function with single output and a single quasi-fixed factor are as follows.

$$PGY = -(\partial \ln CV/\partial t) / (\partial \ln CV/\partial \ln Y)$$

$$PGX = -(\partial \ln CV/\partial t) / \{1 - (\partial \ln CV/\partial \ln K)\}$$

$$\text{and } RTS = \{1 - (\partial \ln CV/\partial \ln K)\} / (\partial \ln CV/\partial \ln Y)\}$$

where PGY is output growth rate keeping inputs fixed. PGX is the rate at which inputs can be reduced keeping output fixed and RTS is the returns to scale parameter.

Table 3 presents the results of a range of estimates we have obtained for the alternative measures of total factor productivity in rice production in the state of West Bengal before and after the year 1977-78 when panchayat polls were first held in the state. These have been evaluated at the mean values of variables for West Bengal using coefficient estimates from Tables 1 and 2.

It can be seen from Table 3 that there has been a spurt in productivity growth in the latter period which cannot be explained by the growth in material input use alone. This can be looked upon as the effect of better management, better project selection at the local level and better utilisation of resources under the auspices of the Panchayats.

IV
Summary and Conclusions

The state of West Bengal has been the only state in India which has for the last 15 years been operating a system of democratically elected local level government. It is also the one among all the Indian states which has successfully carried out certain land reform measures. Critics have argued that the area of ceiling surplus land that has been actually distributed is not very much. It has also been pointed out that the process of registration of share tenants under Operation Barga has covered only a fraction of the share croppers in the state.

But even if one accepts the argument that land reforms in the state have at best been incomplete, the fact that they were undertaken to the extent they were, must certainly have transmitted a political message to the rural masses. It is irrelevant in the present context to try to unearth the rationale of the ruling party's rural development strategy. It could have been spurred purely by political motivations, as some have argued. For our purpose, it is immaterial. What we would want to emphasise is that there is little doubt that, whatever be the reason, the urgency with which the state government had gone ahead with the job of instituting the elected panchayati structure as a forum for ground level planning would surely have been greeted as a change for the better by the majority of the rural poor. That these measures by themselves may have led to a significant increase in production in recent years is a perception which is shared universally by all categories of people covered in the survey we have recently carried out in the rural areas of the state. In this paper we have made an attempt to test this hypothesis by estimating total factor productivity in rice production in the state using a variable translog cost function framework. Our results support the view that institutional factors have played a major role in raising production and productivity in the post-panchayat years.

There is reason to believe that if we had access to more recent data on cost of cultivation of rice in West Bengal, it may have strengthened our results considerably. Production figures have shot up significantly in the late 1980s and have continued to rise in the early 1990s. There does not seem to be any drastic change in technology, although fertiliser consumption has increased in recent years and so has the use of groundwater resources.

One final observation about the absence of water resources as an input in our model. There is an anomaly in using the cost of cultivation data for estimating total factor productivity insofar as the market for groundwater resources, perhaps the leading input in rice production in West Bengal, is far from perfect. Water has been excluded from our set of inputs because of two reasons: one, irrigation charges recorded in the COC data are insignificant fractions of total operating costs, and two, since there is no information on water use, it would have been impossible to calculate the price of water from the COC data. However, to the extent that pumpsets are privately owned, one hopes that they would have been included in our capital index. Even so, if data had permitted a more adequate treatment of water resources in our cost function estimates, it is possible that our estimates of total factor productivity in the state would have been lower.

Appendix

Dependent variable VC: Operational cost per hectare. The Cost of Cultivation data present six different cost estimates.

Our variable cost figures are obtained as follows:

$VC = A_1 + (C_1 - B_1)$

Where A_1 = Sum of all variable items of cost including casual, attached and family labour, hired and owned bullock labour, seeds, fertilisers and manure, insecticides as well as water charges and rent paid for leased-in land.

and $C_1 - B_1$ = Imputed value of family labour.

Independent Variables

Output Y: Yield per hectare

Input price P1: Price of human labour, calculated as a weighted average of price of casual, attached and imputed value of family labour with cost shares as weights.

Input price P2 : Price of animal labour, calculated as weighted average of hired and owned animal labour

Input price P3: Weighted average of prices of seeds, fertilisers and manures.

Capital Index I: Index of gross capital in agriculture per hectare calculated by assuming identical capital/output ratio across states and assigning capital in proportion to the value of agricultural output in the states.

Capital Index II: Depreciation for charges + interest on fixed capital.

All variables have been indexed by setting the sample average for 1980-81 = 100.

Sample The sample used in estimating the equations reported in Tables 1 and 2 consists of annual observations from the following states.

State	Period	No of Observations
Andhra Pradesh	1971-72 to 1983-84	13
Assam	1971-72 to 1986-87	16
Haryana	1977-78, 1979-80 1984-85 to 1987-88	6
Madhya Pradesh	1972-73 to 1977-78 and 1981-82 to 1986-87	12
Orissa	1971-72 to 1978-79 and 1980-81 to 1986-87	15
Punjab	1974-75, 1978-79 and 1981-82 to 1987-88	9
Tamil Nadu	1971-72 to 1981-82	11
UP	1975-76 to 1977-78 and 1980-81 to 1983-84	7
West Bengal	1971-72 to 1981-82, 1983-84, 1984-85	13

The year 1982-83 in West Bengal has been dropped from the sample as an obvious outlier.

Notes

[The paper owes its origin to some questions that occurred to us while conducting a study on the process of decentralised planning under the auspices of the Panchayati Raj system in rural Bengal. The study is being sponsored by the Planning Commission, government of India. We have benefited considerably from the logistic support provided by the State Planning Board of the government of West Bengal. While this particular piece of work does not directly use the information we have collected in the process of carrying out a survey of government officials and elected representatives associated with the three-tier panchayati structure, the core hypothesis of the paper is based on the perceptions of the people surveyed at all levels as well as our own impression gathered during numerous field visits and interviews carried out during the last year and a half.]

1 Summing up the long-drawn out size-productivity debate that Sen himself initiated in the 1960s, Ashok Rudra and Amartya Sen in a paper published in the *Economic and Political Weekly*, 1980 weigh the pros and cons of small farms as follows: 'The advantages of peasant cultivation (chiefly in labour use) have to be balanced against its disadvantages (chiefly in the use of capital)". Primarily, it is the unequal access to complementary inputs which in their judgment can explain instances of lower productivity on smaller farms. Cf Ashok Rudra and A K Sen, 'Farm Size and Labour Use: Analysis and Policy', *Economic and Political Weekly*, Annual Number, February, 1980. For an analysis of 'the stubborn persistence of small peasantry" in the face of technological change in agricultural production, see G Parthasarthy, 'HYV Technology, Polarisation and Immiserisation Controversy', *Economic and Political Weekly*, June 29, 1991.

2 See the 'Statistical Abstracts: West Bengal', Bureau of Applied Economics and Statistics, Government of West Bengal, various issues. Also, 'Basic Statistics Relating to the Indian Economy', Vol II, Centre for Monitoring the Indian Economy, September, 1992.

3 For an account of land reforms in West Bengal in general and Operation Barga - the movement for registering share tenants - in particular, see Bandyopadhyay (1980), Bandyopadhyay (1985) or Ghosh (1986). For an analysis of factors explaining the urge for land reforms and decentralised planning in the state, see Mukherji and Mukhopadhyay (1993).

4 For an analysis and estimation of variable cost functions as an example of a model of temporary equilibrium, see the articles by E R Berndt and M A Fuss, Charles R Hulten and C J Morrison in the *Journal of Econometrics*, Volume 33, No 1/2, October/November 1986. Among the earliest writings on the issue are two papers by Caves, Christensen and Swanson in the *Bell Journal of Economics*, 1980 and the *American Economic Review*, 1981 respectively. Also see Dogramaci (1988).

5 One of the three share equations has to be dropped to avoid the problem of singularity of contemporaneous covariance matrix. The estimates thus obtained are asymptotically equivalent to maximum likelihood estimates. Cf Caves, Christensen and Swanson (1981).

Evaluation of Narmada Projects

An Ecological Economics Perspective

H Jack Ruitenbeek
Cynthia M Cartier

Ecological Economics focuses on the theoretical and applied analysis of activities having potentially significant economic, ecological and social equity impacts. This paper illustrates how concepts of scale, uncertainty, and ecosystem health should be central to any decision-making and evaluation process. Disregard for these factors for the Narmada Valley projects largely invalidates the results of many previous analyses which have typically relied on incomplete traditional cost-benefit analysis approaches.

I
Context

Background

LARGE infrastructure projects on India's major river systems historically have been an important component of India's economic development strategy. They have provided power and irrigation benefits to areas that suffered from low levels of development, while concurrently improving agricultural productivity and the reliable supply of food crops.[1] Many of these schemes have, however, also resulted in negative externalities, as the scale of activities has threatened the integrity of the social and environmental fabric. Recent controversy surrounding the projects in the Narmada valley is a case in point: the potential displacement of up to one million people and disruption of environmental quality has spawned some vehement opposition to development in the region. Ironically, much of the controversy is occurring at a time when policy-makers in India are professing heightened environmental awareness and, indeed, acting on these convictions.[2] For example, the Supreme Court ordered the shut-down of about 200 industrial units in Uttar Pradesh in September 1993 because of unacceptably high levels of environmental impact. Also, recent initiatives in the ministry of environment and forests have proposed a $ 2 billion investment to reduce ozone depleting substances. In all of these cases, policy-makers are faced with the difficult challenge of identifying, assessing and managing unprecedented environmental and economic development trade-offs.

The traditional approaches to dealing with such trade-offs have been well documented for smaller projects. Assessment techniques relying on some form of cost-benefit analysis (CBA), for example, can be used to determine if there are net gains in social welfare from a given project or policy.[3] Incorporating environmental and distributional impacts into such assessments is also, in principle, relatively straightforward if the impacts are well-defined and relatively small.[4] While a number of such analyses have been conducted for various components of the Narmada valley projects,[5] the analyses have been riddled with both practical and theoretical shortcomings.[6] At an applied level the uncertain nature of project environmental costs have often caused analysts simply to ignore potentially significant items. Moreover, the theoretical valuation methodologies are in some instances suspect where, for example, double-counting of benefits has occurred or cumulative effects have not been addressed. Finally, some aspects of current project development and phasing bear little resemblance to those assumed in earlier project assessments; this has cast doubt on the actual relevance of the analyses that have been undertaken. As a result, the evaluations of the projects have become almost as great a source of controversy as the actual impacts of the projects themselves.[7]

The purpose of this paper is to provide a perspective on some of the evaluation issues and controversies from the discipline of ecological economics (EE). EE provides a prescriptive framework for project evaluation that is particularly appropriate for large projects having widespread – but uncertain – economic, ecological and equity impacts. EE attempts to address explicitly the factors often left out in conventional applied CBA procedures. The paper critiques a number of flaws in conventional CBAs of these projects that are based on marginal analyses and that focus on efficiency and risk. The paper proposes a more holistic perspective based on EE principles that, while addressing efficiency and risk, will also pay particular attention to: (i) project scale; (ii) distribution of impacts; and (iii) ecosystem dynamics and uncertainty. Although it is beyond the scope of the paper to conduct a complete analysis of every project component, empirical analyses are presented in each of these three areas to demonstrate the principles. The paper concludes with a discussion of the precautionary principle as an operational tool for pursuing any further development in the Narmada valley.

Project Overview

The Narmada river originates in the central Indian state of Madhya Pradesh. For some 1,300 km it flows west through the states of Maharashtra and Gujarat until it empties into the Gulf of Cambay and the Arabian Sea. The Narmada Valley Project is a basin wide development scheme to harness the river for irrigation, electricity generation and domestic water consumption. The project consists of 30 major, 135 medium and 3,000 minor dam projects to be built in the river basin over the next 50 years. The Sardar Sarovar Projects (SSP) and the Narmada Sagar Projects (NSP) are interconnected components of this larger family of projects. The SSP consist of a dam (Sardar Sarovar), an irrigation canal network, a riverbed powerhouse, a canal-head powerhouse and power transmission lines. The Sardar Sarovar is under construction about 100 km east of Bharuch, Gujarat; it is the terminal dam on the river system. Its operation is critically dependent upon the upstream hydrological management of seasonal flood waters. The NSP to be built about 100 km south-east of Indore in Madhya Pradesh consist of one large dam (Narmada Sagar) and two medium-sized dams (Omkareshwar and Maheshwar). About 90 per cent of the Narmada River's annual runoff occurs in the monsoon season – June through September. The upstream NSP is designed to capture and store flood waters to provide regular releases to the Sardar Sarovar during the dry season.

The Sardar Sarovar and the Narmada Sagar are the two largest dams planned for the Narmada River basin. The Sardar Sarovar, will dam the river to a full reservoir level of 139 m. The reservoir will be 200 km long, inundating about 37,000 ha of land. From the dam-site and irrigation system head at Kevadia in Gujarat, the main irrigation canal will run 458 km to the Rajasthan border. A 75,000 km network of canals, requiring 85,000 ha of land, will then irrigate 1.8 million ha in central Gujarat, drought-prone areas of Saurashtra and Kutch, and a small area (75,000 ha) of southern Rajasthan. At the dam-site, firm hydroelectric power

generation capacity is to be 300 MW, eventually dropping to 150 MW. The Narmada Sagar will submerge 90,000 ha and irrigate 1,23,000 ha of land area in the East and West Nimar districts of Madhya Pradesh. In its initial phase, firm hydro-electric power will be 223 MW, dropping to 118 MW in its final phase. The associated Omkareshwar and Maheshwar dams will together submerge 14,000 ha and irrigate 1 29,000 ha. They will provide firm power benefits of 223 MW and final power benefits of 104 MW.

Land for SSP infrastructure at Kevadia was expropriated in the early 1960s, but major construction of the SSP did not start until 1987. Construction cost estimates fall in the range of US$ 3,500-5,700 million (at 1993 prices). Sardar Sarovar Narmada Nigam is the state-owned corporation in charge of construction. Major construction on NSP has not yet begun, although the government of Madhya Pradesh signed construction contract documents in mid-1992.

Development of the Narmada river basin required agreement by the three states through which the river passes - Gujarat, Madhya Pradesh and Maharashtra. In 1969, the Indian government established the Narmada Water Dispute Tribunal. A decade later the Tribunal's award was presented. As a basis for the apportionment of the benefits, it was agreed that with 75 per cent dependability, there were 28 million acre-feet (maf) of water available (run-off) from the Narmada river. That quantity would be apportioned as follows: 18.25 maf to Madhya Pradesh; 9 maf to Gujarat; 0.5 maf to Rajasthan, and 0.25 maf to Maharashtra. Should the actual run-off deviate from 28 maf the percentage shares would remain the same. Run-off was not allocated for river flow downstream of the Sardar Sarovar dam. Electrical power and energy benefits would also be shared. 16 per cent to Gujarat, 57 per cent to Madhya Pradesh, and 27 per cent to Maharashtra.

The resettlement and rehabilitation (R and R) of persons displaced by the SSP is a focus of national and international criticism. Lack of early planning and public consultation by the three states has resulted in relocation efforts which are unco-ordinated and insensitive to the cultural and socio-economic characteristics and needs of the people involved. Moreover, the number of people to be displaced was underestimated and sufficient resettlement land is still not available. Further complicating R and R efforts, the three states have differing policies regarding the entitlement of compensation to various categories of 'oustees'. Categories include, landed, landless, encroacher, major son, oustee due to submergence, and oustee due to dam infrastructure. Resettlement entitlements attached to each of these categories depend on the oustee's home state. Consequently, the ability of many oustees to maintain their standard of economic and social well-being is severely curtailed. Studies by the Tata Institute, which has the mandate of monitoring performance of the R and R programmes, indicate that many of those being resettled are not achieving minimum nutrition standards, although before resettlement they were at or above acceptable subsistence levels.[7]

The environmental assessment of the Sardar Sarovar and Narmada Sagar projects has been severely criticised. The assessment process failed to achieve compliance from the project's proponents, accepted a *pari passu* approach, and treated the NSP and the SSP as unrelated initiatives. In 1983, plans for both the NSP and the SSP were submitted for clearance to India's ministry of environment and forests (MOE and F). Clearance was denied due to data deficiencies. Clearance was continually denied until 1987 when political pressure from the state governments extracted a 'conditional' clearance for both projects. Conditional clearance meant, among other things, that detailed surveys and studies would be submitted by 1989, and that environmental impact assessments would be done as construction proceeded – the *pari passu* approach. Most of the conditions set by the ministry were not met by 1989 and many remain to be met. Project proponents used the *pari passu* clause as a means to justify their position that they need not apply for an extended clearance.

The NSP and the SSP had not yet received environmental clearance from the Indian MOE and F when, in 1985, the World Bank approved a US$ 450 million credit and loan agreement for the SSP. Despite the interconnectedness of the two projects, consideration of the NSP was deferred pending progress on the SSP and an environmental assessment of the NSP. For the SSP, the bank required an environmental work-plan to be completed by the end of 1985. The bank also required state plans for resettlement and rehabilitation of oustees. Between the 1985 loan agreement and early 1993, continual requests for the plans were met with obfuscation from project authorities. The plans were still not completed in March 1992, when pre-empting the World Bank, India cancelled its loan agreement and the remaining US$ 170 million disbursement.

In March 1991, in response to growing controversy, the World Bank commissioned an Independent Review of the SSP. In June 1992, the review panel presented its findings, key among which were the following:[8]

- The R and R of all those displaced by the SSP is not possible under the prevailing circumstances. Resettlement policies differ among the states, eroding the oustees' right of choice. Madhya Pradesh, with the bulk of the total displaced population, is reluctant to make land available to oustees. Gujarat's resources are strained to settle its own people affected by the submergence, the canals and the town; yet it is supposed to settle oustees from Maharashtra and Madhya Pradesh.
- Although the Sardar Sarovar and Narmada Sagar projects are inextricably linked, there was no attempt to assess their cumulative impacts. Furthermore, because the NSP are not being built concurrently with the SSP, as originally assumed, the benefit stream to the SSP will not be as assumed.
- With or without the NSP, the SSP will not operate as planned. Without the NSP, regular releases during the dry season from upstream storage will not be forthcoming. Even with the NSP, however, analysis of hydrological data indicates that water availability is overestimated. In either case, the target amounts of water will not be delivered and project benefits should, therefore, be adjusted downward.
- Environmental impacts in the irrigation command area are unknown and likely to be significant. Lack of planning for adequate drainage to counteract water logging and salinisation will reduce the agricultural benefits of the irrigation component.
- The effects of sedimentation are underestimated in the case of reservoir siltation and ignored in the case of the 'backwater effect'. The siltation rate of the reservoir will be higher than assumed, reducing its useful life and associated benefits. Sedimentation at the upstream end of the reservoir will create a delta and result in the submergence of significantly more land than was originally anticipated. Downstream ecological impacts of the dam are not considered. No allowance for river flow below the dam was made and the consequent impacts on brackish and freshwater fisheries are unknown. The number of downstream fisher families is unknown. Also unknown are the impacts of salt water intrusion on the domestic water supply of downstream urban centres.
- Measures were not taken to prevent the spread of health hazards such as malaria. There has been a total collapse of vector control measures and the incidence of malaria, and death from malaria, increased in the irrigation command area.
- Upstream afforestation measures are poorly conceived. Afforestation to replace submerged forests is planned on marginal lands, while high quality forests are being cleared for resettlement. The result will be a net decline in the quality of Indian forest land.

Despite loss of World Bank and other international backing for the SSP, India and the riparian states are moving ahead with the project, which at this point is about half

finished. SSP authorities are still targeting completion by the year 2000. In addition to national and state government funding (Gujarat is using more than 80 per cent of its irrigation budget for the SSP), funds are being sought from the private sector through bond issues and through privatisation of project components. Sardar Sarovar Narmada Nigam floated a US $ 100 million bond issue in late 1993 which was over-subscribed and eventually returned almost US $ 120 million; and Gujarat has plans to privatise partially the power component of the project.

Successful resettlement of those displaced by the SSP is unlikely. In July 1993, with the onset of the monsoon, the partially complete Sardar Sarovar dam started impounding water. News reports indicate that hundreds of families in the first villages scheduled for submergence were not yet resettled. Only a fraction of those who will be eventually submerged by the reservoir have accepted resettlement packages. Of those, many have found their resettlement package to be significantly deficient. Protest demonstrations against the dam escalated during 1993 as hundreds were arrested, thousands pledged to drown rather than move, people were forcibly evicted from their homes, and reports of human rights abuses proliferated.

In response to mounting national and international pressure not to commence with flooding until all appropriate studies had been done, another independent review of the SSP was commissioned in August 1993. The report of a five-member panel was intended to be ready by mid-November 1993 but was not yet complete at year-end 1993. In any event, its recommendations are not legally binding. Moreover, it is notable that in December 1993 the environmental sub-group of the Narmada Control Authority (NCA) advised the NCA that it should not close the sluice structure that would inevitably lead to inundation. While the initial response of the NCA was to heed this advice, in late February 1994 work started at the foot of the Sardar Sarovar Dam that would close the sluice gates. If inundation in fact is allowed to occur, it shows that the NCA has effectively abandoned its approach to *pari passu* as R and R is not yet complete.

II
Theoretical Discussion

Interest in ecological economics (EE) has evolved from an increasing concern that economic policies and environmental policies need to be better co-ordinated.[9] It draws on decades of experience from multiple areas of investigation in the natural and social sciences. Some of its key policy prescriptions – such as the 'polluter-pay-principle' and the 'precautionary principle' – have found their way into policy discourses of industrialised and developing countries alike. Although some of the roots of the discipline are found in the neo-classical conventions of environmental economics, EE draws more on current ecological thinking to describe system behaviour and to prescribe appropriate policy interventions.

The rapid changes being experienced in many countries provide a need for rational planning approaches that will ensure that the limits of the economic, social, and environmental systems are not breached.[10] As EE addresses the interactions of these three dimensions, EE plays a potentially important role in rational planning. These three components – the economic dimension, which captures aspects of efficiency, the environmental dimension, which captures aspects of ecological significance; and the social dimension, which captures aspects of equity – all form important theoretical and practical cornerstones to EE approaches.

Perhaps foremost, EE relies on a number of reference assumptions which are subtly different than those under which conventional neo-classical economic analyses often occur. First, EE explicitly acknowledges that system behaviour is scale-dependent, in particular, natural ecosystems that are critical to human life support functions are finite in extent (and often have no substitutes) and will generally become less stable as the scale of development activities expands. Maintaining the functionality of such 'natural capital' through limiting the scale of activities can therefore be of key importance. Second, the uncertainty of ecosystem-economic linkages is explicitly acknowledged and, in particular, a 'viable' general equilibrium cannot always be assumed to exist. Precautionary planning approaches which provide some flexibility in project design are therefore generally favoured. Finally, maintaining the self-organising capacity (e g, 'health') of the broader ecosystem is regarded as a potential objective in its own right. This does not necessarily imply that people's lives are sacrificed for the sake of the broader ecosystem; people are, however, treated as an integral component of the ecosystem and their interests are inextricably tied to the well being of the larger system.

Lessons from Ecological Economics

The theoretical discourse and applied work within the EE discipline has resulted in a number of important lessons which are of relevance to project assessments of the sort required for the Narmada Valley projects.

Ecological economics explicitly treats 'scale' as an important third dimension in project assessment: economic efficiency and distributional equity are the other two dimensions.[11] The basic arguments for incorporating such a measure are quite straightforward. The 'scale' dimension essentially provides a feasibility constraint to the overall system. One might imagine a project, for example, which is apparently completely optimised for efficiency and has an equitable distribution of costs and benefits. If the presumed project is not, however, sustainable because it exceeds physical constraints of a bounding ecosystem, then the project would not be viable. Such instances typically arise for water which may be a limiting resource in many instances.[12] It might be argued that if the implications of the project were properly analysed in the first place, then the supposed efficient and equitable allocation alluded to here would not have been selected. However, by explicitly recognising scale as a project variable, analysis can ensure that it falls within the carrying capacity of the broader ecosystem. To operationalise this approach, applied techniques usually focus on the scale of project activities relative to the values of other activities which are supported by the broader ecosystem.[13]

The above notion of scale is relatively static; it asserts simply that projects should be designed within certain limited criteria. One might imagine, then, that a project could (and possibly should) approach this theoretically limiting scale. A second lesson from EE, however, asserts that the ecosystem's resilience to stochastic exogenous shocks is reduced as projects approach the limiting scale of the ecosystem. In simple terms, 'surprises' become more likely as scale increases. The limiting scale then itself becomes a function of how a project or policy set can adapt to changing circumstances that, for example, lead to the collapse of key ecosystem functions. In practical terms, such factors tend to be most critical when ecosystem boundaries are relatively well-defined[14] or where a series of apparently small projects and policies have significant cumulative effects. Indeed, much of current environmental assessment attempts to address the issue of cumulative effects.[15]

Ecosystem behaviour is inherently uncertain. The uncertainty is manifested in the sense that many of the consequences are unknowable (as opposed to knowable consequences to which some probabilities might be attached). The reason for this is primarily the non-linearity of ecosystems; the expanding science of chaos theory tells us that such systems may flip from one state to another relatively quickly if certain stresses are applied.[16] Non-linear chaotic behaviour is becoming increasingly recognised as a component of economic systems.[17] But such behaviour is so pervasive in ecological systems that it is problematic to apply the usual 'marginality' assumptions of economic analysis to these types of systems. As noted previously, the behaviour becomes more pervasive as the 'scale' of some activity becomes larger; 'surprise' fisheries collapses

in many parts of the world are being attributed to activities which approached the limiting bounds of the available stocks.

Inherent uncertainty in ecosystem behaviour, an incomplete understanding of how various components of ecosystems interact and an incomplete understanding of how ecosystems interact with human economic behaviour, are all part and parcel of the current state of theory in this area. As a result, it has been impossible to formulate and to prove an 'integrated existence theorem' which allows us to assume that a concurrent well behaved general equilibrium of ecological and economic systems exists.[18] Current existence theorems used to assert a general equilibrium within the economic discipline effectively assume that bounding systems equilibrate. But an integrated existence theorem that does not make this assumption is critical for larger projects if, as in standard economic analysis, we are to use valid assumptions regarding project evaluation parameters. The only 'integrated existence' theorem which is currently provable is the rather uninteresting case in which ecosystems flip into a new equilibrium which excludes human activity: 'death is always the final equilibrium'.

An important concept arising from the ecological sciences is that of 'ecosystem health'. The general idea is to draw some analogy to human health, implying that a certain set of measures (equivalent to pulse, blood pressure, etc.) can be derived to describe the general state of ecosystem functioning. While research in this area is still at a relatively early stage, a number of important lessons have been learned to date. Foremost, because ecosystem behaviour is inherently uncertain, maintaining an ecosystem's ability to adapt to changing circumstances can in itself be regarded as an important policy goal. This adaptability is generally referred to as its 'self-organising capacity'. A critical component of this is, indeed, the *human* element of the ecosystem, which has the ability to nurture and protect overall ecosystem health in its own self-interest. Projects which pose a potential threat to this self-organising capacity might be rejected outright (in the case that they threaten key life-support functions) or might be adjusted to include explicitly adaptive capacity.

In summary, to reflect these lessons, common elements of many EE policy prescriptions include: (a) a call for precautionary policy formulation that does not threaten critical environmental support systems; (b) a call for increased attention to the social equity dimensions of policy design; and (c) stronger decentralisation of decision-making authority to resource users, or to individuals directly experiencing the impacts of resource use. These types of policies, as a general set, have been referred to by the International Institute for Environment and Development as 'primary environmental care' (PEC) to reflect the idea that economic, environmental and equity goals should all be addressed simultaneously.[20] The 'decentralisation' theme arises from the abundance of evidence that such decentralisation jointly achieves three goals of sustainable development: it improves economic efficiency; it leads to improved environmental management; and it increases social stability through giving individuals a greater sense of empowerment. Examples of greater decentralisation include: establishment of some form of property rights, reliance on price and market signals for environmental management (as opposed to regulations); and, delegation of environmental responsibility to local authorities, with concomitant enabling fiscal powers.

Implications for Project Valuation

The use of *properly-formulated* CBA is achieving renewed interest as it provides a means for quantifying economic and environmental effects using a common numeraire. Although the theory of CBA is well established and has not undergone profound changes over the past decade, much of the criticism of CBA has been levelled at its improper application; while the theory clearly calls for consideration of social, environmental and other impacts, these are often not addressed in practice because of the difficulties associated with specifying or valuing the impacts. When honest attempts are made to consider these impacts, however, they provide a useful tool for project appraisal and planning. There are, however, still a number of important theoretical constraints to adopting CBA.

Even within the accepted theory of CBA, it is important to recall the limiting assumptions of its validity. Foremost, typical valuation assumptions *require* that the project be a relatively small project which does not undermine the general equilibrium (GE) of the economic structure. Analysis of large projects, or of projects which involve massive income redistribution, requires estimation and consideration of new GE conditions.[21] In addition, for such large projects, shadow-pricing and project feasibility assumptions must reflect potential macro-economic financing constraints and the fact that projects may themselves be correlated with national income.[22] In particular, this may require explicit acknowledgment of risk within the project appraisal; at a minimum, this requires use of expected values instead of model values.

In addition, however, EE points to a number of other limitations of CBA. First, standard economic theory tells us that large projects require explicit calculation of GE effects. Because the lack of an integrated existence theorem implies that such GE modelling cannot satisfactorily incorporate environmental effects, the use of CBA on large projects having a scale that approaches the resilience limits of some ecosystems should be regarded as suspect. This also applies to small projects that, when taken cumulatively with a number of related projects, approach a relatively large scale.

Second, the unquantifiable *uncertainty* discussed earlier limits the applicability of CBA to situations which have reasonably well-defined potential outcomes. Where such outcomes are not well-defined, analyses must explicitly attempt to account for uncertainty. The general approaches to do this in the literature involve either sensitivity analyses, risk analyses based on probability distributions, risk analyses based on adjustments to the discount rate, or explicit calculations of option values. Sensitivity analyses are not generally very instructive in practice, and probability-based analyses do not address the problems of unquantifiable uncertainty. Also discount rate approaches have largely been discredited as an appropriate form of risk analysis for environmental problems: there is no *a priori* reason for assuming that either an increase or a decrease in discount rates will be more representative of an environmentally sensitive appraisal in a world in which the social discount rate is assumed as exogenous.[23] Where ecological uncertainty from non-linear systems arises it would, for certain projects, require that negative discount rates be used for appraisal.[24] Moreover, even if a multi-generational general equilibrium did exist, then discount rates are in fact endogenously determined under a 'sustainability' constraint; such discount rates should therefore not simply be assumed as exogenously applicable to all appraisals.[25] In short, valid discount rate approaches themselves require knowledge of the interactions between various system components. Where this information is unavailable, 'option value' methods remain as a potentially applicable technique. Essentially, these approaches place a value on 'undisclosed future information': the literature dealing with critical ecosystems, however, clearly shows that rational choices under such calculations generally lead to flexible, precautionary policies and projects.[26]

Third, the issue of ecosystem health essentially raises the question of how much should rightfully be incorporated within the objective function of a CBA. Many attempts at evaluation of environmental impacts essentially assume that trade-offs are possible. If, on the other hand, maintaining the self-organising capacity of the ecosystem is taken as a separate 'higher-order' objective, then any subsequent CBA can be used only to the extent that it evaluates projects or policies that operate within this

constraint. Although it is acknowledged that, in theory, some degree of optimisation of a system's self-organising capacity may be appropriate, such fine-tuning is generally rejected in practical terms. The favoured approach explicitly separates the ecosystem health constraint, if it can be demonstrated that the potential risks to ecosystem or human health are relatively large.[27]

In closing, it is relevant again to note that much of the above can, in theory, be incorporated within a well-formulated CBA if objective functions are properly specified and if the existence of technical feasibility constraints is acknowledged. The complexity of undertaking such a CBA in applied work, however, extends far beyond that which is typically attempted in standard project appraisal. In the case of large infrastructure projects – such as those in the Narmada Valley – the scale of the proposed projects and the lack of information relating to environmental impacts and linkages seriously undermines the tractability of such an exercise. For this reason, there is an increased call for mutli-criteria analyses (MCA) to be conducted on large projects with high uncertainty and potentially substantial ecological impacts.[28]

III
Empirical Discussion

Numerous analyses have been undertaken of various components of the benefit and cost streams that might be associated with the Narmada Valley projects. Some of these have involved simply qualitative statements whereas others have attempted more rigorous estimates of the physical and monetised impacts. An overview of the general extent of some of the benefits and costs is provided in the figure; this inventory is meant to be indicative only of the nature of some of the more potentially significant impacts.[29] There is, as noted earlier, significant controversy over the actual extent and value of a number of these impacts. The purpose of this section is to highlight selected impacts and to show in greater depth three of the issues – relating to scale, uncertainty, and ecosystem health – of interest to ecological economics.

Many of the original objections to the CBAs of the projects focused on the fact that they either completely ignored important externalities or that they effectively double-counted certain project benefits. In some cases, the original CBAs simply ignored even significant market transactions. For example, most project descriptions assert that significant benefits will accrue because of domestic water provision, yet the formal project definition excludes the technical components (and costs) related to such provision. These costs are estimated to be as high as Rs 5,000 crore.[30] Subsequent criticisms of the CBAs focused on the technical assumptions under which they were undertaken. For example, original evaluations neglected evaporation losses and seepage from the canals, resulting in overstated benefits for irrigation.

While criticisms of this sort are legitimate challenges to the integrity of the analyses, they overlook the broader issue of whether such CBAs should, in this case, be regarded as valid analytical tools. The previous section demonstrated that CBAs which ignore scale, uncertainty, and ecosystem health are inherently flawed if these three issues can be demonstrated to be important factors. The following provides analyses of these issues to demonstrate that, in the case of the Narmada Valley projects, they are indeed relevant issues. The analyses are based largely on information already available for these projects, yet the information is cast within the context of these three issues.[31] The general approach is to provide selected monetised estimates of costs to illustrate that within the context of other project costs, these issues are indeed significant.

Measures of Scale in Environmental Impacts

A major issue of project scale with the Narmada Valley projects is the extent of the linkages and dependencies between the SSP and the NSP. The independent review noted that the SSP would not work as anticipated because the design of the SSP in fact required that the NSP were in place upstream to provide the required water control; under the circumstances, many of the asserted benefits of the SSP would be quite specious. A complete analysis must consider the cumulative effects of all of the major project components which, in this case, include the upstream Narmada Sagar projects.

It is instructive to consider some of the more significant potential environmental costs associated with basin-wide development in comparison to the construction costs of the SSP and other economic indicators within the region:

	(in 1993 millions of US $)
Construction of SSP only	3,500-5,700
Construction of SSP and NSP	4,800-7,000
Downstream impacts-mitigative water management	2,200-3,500
Upstream impacts – Environmental costs of forest loss (approximately)	23,700

The downstream impacts represent the mitigative costs associated with ensuring that the water supplies are indeed available for domestic and livestock use. Given that salt water intrusion is likely, these estimates include provisions for mitigating impacts of salinisation. It is important to note, however, that these estimates are *modal* values; while there is some chance that costs will be less than this, there exists a possibility that severe aquifer damage from upstream watershed modifications will substantially increase the mitigative costs associated with this water supply. The upstream environmental impacts from (primarily) the Narmada Sagar projects are almost an order of magnitude greater than the actual construction costs of the projects themselves. Again, however, these are modal estimates of the immediate land-use impacts; greater impacts are conceivable if unforeseen hydrological effects occur as a result of forest cover losses.

When these figures are placed in the context of direct project costs and of other economic factors in the region, it is clear that the scale of the impacts is unprecedented. The state of Madhya Pradesh, which is one of the lesser developed states in India,[32] has a GDP of approximately US$ 11,000 million annually. Gujarat and Maharashtra GDPs are approximately US$ 13,000 million and US$ 26,000 million respectively. Even though the impacts will be spread over some years, the scale of the potential impacts is quite significant. Given that many of the forestry losses will be in Madhya Pradesh, massive economic adjustments would occur in this state given its relative poverty. As it is not possible to predict the general equilibrium impacts of this type of environmental disruption, the application of traditional forms of CBA is highly suspect.

Measures of Uncertainty in Distributional Impacts

There is little question that persons will be displaced by both the SSP and the NSP because of the dam infrastructure, the irrigation canal networks, and the reservoirs. One of the key issues with the projects, however, relates to the uncertainty of the distribution of impacts. This arises from a number of factors. First, the actual impacts on population displacement are relatively uncertain. Second, the manner in which the people will adjust to that displacement is also highly uncertain. In the case of the SSP, conservative estimates indicate that 245 villages with a total of 1,00,000 people will be displaced by the reservoir. The displaced population of Madhya Pradesh will be about twice as large as the combined displaced populations of the other two states. The canal network will affect about 1,40,000 farming families, 24,000 of which (some 1,20,000 people) will lose at least 25 per cent of their land. About 5,000 people have already been displaced by the dam-site and irrigation head infrastructure. In the case of the NSP, estimates done in 1988 indicate that about 2,00,000 people will be displaced by the reservoir alone. The Narmada Valley project as a whole is expected eventually to displace over one million people. Not included in any of these estimates are the affected persons who live upstream and downstream of the projects, and those who live in areas to which persons displaced by the projects are resettled. Given the current

regional disparities extant in the area," failure to address this uncertainty can be expected to lead to significant social tensions and – potentially – to increased economic hardship.

In economic terms, the nature of the impacts may be quite significant. The potential ranges of economic costs associated with population displacement from all of the projects are estimated to be as follows:

	(*US $ million/year*)
Losses from displacement (lower estimate)	100
Losses from displacement (upper estimate)	>530

These are order-of-magnitude estimates based on the lost production from current economic activities. Most of these costs would be borne in Madhya Pradesh, which is at greatest risk from more extensive flooding because of backwater effects and risks associated with deforestation and ineffective reforestation programmes. To place this in perspective, it is significant to note that the direct costs (of resettlement and land acquisition) have been estimated as a one time budgetary requirement of about US$ 275 million for the SSP area and an additional US$ 425 million for the NSP area. If the higher estimates of losses are in fact realised, this budget level is likely to be wholly inadequate. Moreover, the unavailability of suitable land noted by the independent review suggests that compensation budgets may be inadequate in any event.

Under these circumstances, it is again clear that many of the traditional assumptions relating to GE in the region will likely not apply in this instance. The uncertainty poses a serious challenge to assessing the impacts, given that the uncertainty is derived from a combination of environmental impacts, labour movements, and economic opportunities in different parts of the region. While GE structures might (under ideal circumstances) be capable of accommodating some of the adjustments in labour markets and economic opportunities, the effects of uncertain environmental impacts can not be assessed at this stage. For CBA to have an application in such circumstances, however, it must be able to assess the GE impacts of any potential scenarios.

Impacts on Ecosystem Self-Organising Capacity

An important issue in measuring ecosystem integrity is to maintain its self-organising capacity intact. Threats to an ecosystem's resilience can, over the long term, lead to a breakdown in the system's ability to deal with exogenous shocks. This is most readily seen in the aspect of human health. People are, in all respects, an important element of the broader ecosystem and, to a large degree, human health can over the long term be regarded as an indicator of broader ecosystem health. In the Narmada Valley project area, the single most important threat to human health is the potential impact through water-related diseases. A World Bank report stated that malaria presented a serious threat in the vicinity of the canal network and the potential for schistosomiasis existed throughout the area. The Independent Review noted that malaria outbreaks and deaths had occurred near the dam site; schistosomiasis has been confirmed in at least one village in Maharashtra. In this example, an analysis of the potential economic impacts of the increased incidence of malaria illustrates that, here too, the magnitude of the impact suggests that there is a real threat to overall ecosystem health.

Estimating the economic impact of malaria is relatively complex. In principle, the correct economic valuation is based on an assessment of how much compensation individuals

Figure. Selection of Asserted Benefits and Costs from the Narmada Valley Projects
(SS = Sardar Sarovar, NS= Narmada Sagar, 1993 prices, values in crore = 10 million Rs)

Benefit	Description/Nature of Benefits
Irrigation	Irrigated area of 1-2 million ha. Area served by SS depends on upstream control at NS
Power	SS has installed capacity of 1450 MW; additional capacity of 1590 MW from NS projects
Domestic water	From 25-40 million people will have improved access to domestic water supply.
Livestock water	In the northern part of Gujarat, pastoral families will have improved access to water.
Industrial water	Narmada Water Disputes Tribunal Award allocated 0.207 maf to industrial uses
Pisciculture	Estimated improvements of the order of 70 crore for NS project area
Flood control	Flood control exists from Narmada Sagar projects as upstream control structures.
Reduced imports	Increased foodgrain and oilseed production reduces need for imports
Cost	**Description/Nature of Costs**
Dam construction	Dam works at each of the NS project (4,200 crore) and SS project (11,000-18,000 crore) areas will be constructed
Catchment area treatment	Demarcation of degraded areas, nursery development, and action programme for treatment of catchment area at cost of approximately 1,100 crore
Command area development	Provision of surface and sub-surface drainage and pollution control measures to mitigate waterlogging, maintain water quality and optimise water use (2,500 crore)
Compensatory afforestation	An area of 90,000–97,000 ha of degraded forest will be afforested at a cost of approximately 1,700 crore.
Canal construction	Canal network will involve about 75,000 km of canals (including main, branch, distribution and minor canals) over 85,000 ha
Domestic water provision	Supplementary costs of water supply were excluded from earlier estimaes of project costs. Cost estimates range from 1,500-5,000 crore for SS project area.
Power consumption	Supplementary power requirements for lifting groundwater and operating domestic water distribution. Costs estimated in range of 2,700-3,400 crore for SS project area.
Resettlement and rehabilitation	Total direct resettlement and displaced persons estimated to be as high as 1.5 million individuals. Many are indigenous people. Total direct costs are 2,200\ crore.
Forestry loss and associated environmental losses	Submergence will cause loss of 43,000 ha of forest in NS proejct area and up to 16,000 ha in SS project area. Total direct costs of forest loss are about 600 crore. Total indirect environmental costs (excluding loss of genetic resources) associated with forest loss are 73,500 crore, using norms established by the Forest Research Institute.
Agriculture land loss	Submergence will cause loss of 44,400 ha of agricultural land in NS project area and 11,300 ha in SS project area.
Wildlife impacts	Loss of corridors will reduce habitat and threaten ecosystem biodiversity
Sedimentation and siltation	Sediments reduce useful life of dam, reduce power generation capacity, and create backwater effects which inundate upstream areas above submergence zone
Waterlogging	Soil degradation and fertility loss from waterlogging anticipated in 1,00,000 ha in Narmada Sagar project area.
Salinisation	Salt water intrusion of surface and ground water anticipated in downstream urban and rural areas. Mitigation requires supplemental pumping.
Health impacts	Increased incidence of malaria, filaria, cholera, gastroenteritis, viral encephalitis, goiter and some other water borne diseases in vicinity of reservoirs and canals.
Pollution	Increase in suspended sediments and retention of pollutants from decreased circulation.
Cultural heritage	Loss of important religious sites and tourism potential.
Earthquake risk	Recent events have tragically underscored the seismicity of the region. Fears exist that dam construction will increase seismicity.
Fishery loss	Hilsa, mullet and prawn species threatened. Losses will exceed 385 crore in Gujarat, much of which will be foreign exchange.

Note: The literature typically includes a wide range of cost and impact estimates for various benefit and cost components. Those presented in this table are intended to show order-of-magnitude estimates to provide a context for understanding the projects' implications. See text for references.

would be willing to accept for putting up with high malaria levels. Measuring this is problematic, and the best that rigorous economic methods can often provide is a measure of 'willingness to pay' for reduced malaria; this is typically somewhat less than the willingness to accept measure. But substantial research is required to estimate the willingness to pay, and a lower bound of this measure is often estimated based on the direct impacts on productivity and health care.

Illustrative calculations can be made for a typical scenario within the region, assuming that a malaria outbreak occurs as a result of the projects. If epidemic levels are reached, malaria incidence might be expected to approach approximately 200 cases per 1,000 of population at risk, with child mortality at 50/10,000 and general adult mortality of the order of 20/10,000. Given an 'at risk' population in the region of approximately 50 million people, the malaria incidence would involve some 10 million cases annually, 1 per cent of which would result in death. Although India has implemented successful malaria eradication programmes in the past, modern control programmes are becoming increasingly more expensive.[47] If India could control the malaria outbreaks at close to historical cost (US$ 3 per case averted), then the mitigation costs could be as low as US$ 30 million annually. If, on the other hand, more complex vector-control procedures are required to combat the particular strain, then eradication costs may in fact approach those in other developing countries. In this case, the economic impact would translate to malaria control costs of the order of US$ 400-1,100 million annually. The alternative to incurring these costs would be, of course, to accept the productivity losses from higher morbidity and death rates.

These costs are, in fact, a lower estimate because (a) they exclude a premium component that people are willing to pay for lower malaria incidence; and, (b) no productive economic value was attached to deaths averted. Again, however, the magnitude of the impacts illustrates that – if a major upset occurs in ecosystem integrity – the entire regional economic structure can be undermined. From the perspective of any CBA, such an upset would invalidate the assumptions under which the CBA is in fact a valid analytical tool. To maintain the integrity of the CBA, constraints should, in this case, be placed exogenously on the set of allowable outcomes to ensure that such a complete collapse in the integrity of the ecosystem does not happen.

IV
Conclusions

In effect, the discussions in this paper have argued that traditional methods of CBA are largely incapable of providing any meaningful guidance relating to the overall desirability of the Narmada Valley schemes. Partial empirical analyses demonstrate that scale, uncertainty in distributional impacts, and risks to ecosystem and human health are all potentially significant issues. Under such circumstances, 'precautionary' project development and policy approaches are appropriate; these will, in turn, constrain the potential development options and likely require increased reliance on smaller-scale solutions.[48]

Such approaches will generally attempt to ensure the continued functionality of critical life-support systems. Also, they will explicitly build in a higher degree of reversibility in decision-making than would otherwise prevail. Specifically, key policy interventions will likely be required in three key areas.

Cumulative Assessment and Planning

Planning approaches must recognise and accommodate the fact that cumulative environmental impacts of various project components may in turn threaten the presumed levels of benefits from these projects. In particular, this requires that the SSP and NSP not be planned and evaluated in isolation of one another. If inadequate information exists on a key system component, evaluation of related projects that depend on such components should be suspended until such information is available.

Distribution of Impacts

Uncertainty in the extent and degree of the distribution of impacts suggests that greater contingency planning is required in the event that benefits are not realised or harmful impacts are greater than those currently anticipated. In particular, this could be targeted to those individuals who were the worst-affected as a result of any unsuccessful resettlement and rehabilitation.[49] One potential mechanism to achieve this is to create a stand-alone precautionary fund that would be dedicated to dealing with unforeseen circumstances relating to resettlement or environmental problems. The fund should also be capable, in effect, of placing levies on project beneficiaries through, for example, water charges or surcharges on power use. There are numerous precedents for such mechanisms in other countries.[50] Also, although such mechanisms technically require the 'earmarking' of funds, such earmarking is becoming increasingly accepted even within the traditional concepts of public finance theory if it provides, in effect, a precautionary insurance focus for uncertain events.[51]

Maintenance of Ecosystem Functions

Perhaps foremost, precautionary policies require that one establish a set of operating constraints which ensures that the self-organising capacity of critical ecosystem components is not threatened. Where the impacts on ecosystem function are uncertain, a development strategy must include adequate reversibility such that if the constraints are breached, it will be possible to implement mitigative programmes. Such strategies in critical areas are typically characterised by smaller-scale, phased developments which are coupled to a monitoring network that allows policy makers to track impacts of activities.

One question the above points raise is, 'Is a development moratorium optimal?' The answer to this question must surely be that large-scale development should be halted, but that a development moratorium on smaller projects in the Narmada Valley is likely not optimal. A number of analysts have noted that, even once all of the information regarding environmental impacts is revealed, the SSP and NSP schemes may on balance be quite beneficial. Imposition of a moratorium on all development would, in effect, also imply imposing a moratorium on all of the necessary information on which rational decisions might be based. The problem is that with projects of this scale, the only way to generate the required information is through experimentation on progressively larger scales. In this context, a major criticism of the current scheme is that it proposes running the experiment immediately on the largest scale imaginable.

Although precautionary policies do not necessarily imply imposition of a broad-based development moratorium, they do imply an approach that will likely rely on a larger number of small projects.[52] It is, moreover, acknowledged that the construction costs of such smaller projects may be greater than that of the currently proposed scheme. The issue here, of course, is that such higher costs are justified because of the flexibility and options provided by such an approach; concurrent monitoring of environmental and social conditions will indicate whether development can progress more or less rapidly. Although, historically, large-scale developments may have been favoured, there is increasing evidence in India that smaller-scale approaches can also be an important development strategy where critical environmental or social issues are concerned. For example, almost Rs 30,000 crore has been committed within central and state budgets to improving renewable energy development during the ongoing Eighth Five-Year Plan.[53] Given that large-scale development potentially threatens the ecological integrity of the entire Narmada River basin, perhaps such smaller-scale approaches are also more appropriate to the Narmada Valley.

Notes

[An earlier version of this paper was presented to 'The Narmada Forum' Workshop on the Narmada Sagar and Sardar Sarovar', convened in Delhi, India on December 21-23, 1993. The workshop was organised under the Economic Security Programme of the Centre for Development Economics (Delhi School of Economics) in collaboration with the Institute of Economic Growth.]

Feminism at the Margins of Anthropology

Kamala Ganesh

THE responses to Dipankar Gupta's 'Feminification of Theory' (*EPW*, March 25) have comprehensively highlighted the extreme selectivity of his citations of feminist studies to make sweeping generalisations. In particular he has ignored the thrust of women's studies in India which has not only been alert throughout to the need for linking activism and academic work, but also been wary of any extreme descent into preciousness or esoterism. I would here focus only on his treatment of anthropology and postmodern anthropology (or the 'new ethnography', as it has often been referred to) and his silence on contemporary feminist anthropology. Gupta argues that more than any other social science discipline, anthropology by its very nature is particularly hospitable to postmodern tendencies and that "it is not at all surprising that feminists should borrow freely from this discipline, either from within or without". One naturally presumes that he will follow this up with examples from and analysis of feminist anthropology/anthropology of gender/anthropology of women (I am using the terms interchangeably) and with specific examples of feminist (non-anthropological) studies that have borrowed freely from anthropology. One waits in vain. Except for a passing reference to Mascia-Lees et al (1989) who in fact have developed in great detail an argument on why feminist anthropology is incompatible with postmodernism, there is no substantiation of what is surely a major peg in his argument.

Gupta's characterisation of the discipline of anthropology is as totalising and ahistoric as his characterisation of feminism. He seems to be ignoring the serious changes within the discipline in its different phases.

On the one hand, he argues that the field of the anthropologist often loses its objectivity, since nobody else is likely to ever go to the same locale and challenge his research. This is a moot point. Shostak who worked among the !Kung records that she had been preceded by several succeeding waves of anthropologists; Margaret Mead's material and interpretation have been challenged by Derek Freedman who went there years later. Fields are finite entities and cannot remain endlessly pristine for generations of anthropologists. Gupta's point has some validity for the early phase of the discipline, but then all the more reason why such unchallengeable anthropologists "in some dank and dreary rain forest" would claim scientific validity for their data rather than call it 'fictions' or 'creations of the mind' (thus undermining their own work at a stage when postmodernism was not yet an attractive option and scientificity was at a premium). The choice of metaphor, poetry and literary trope would be the convenient stance (if one wants to label it as pure stance) if others have written about the same field and do challenge him. This then would be attractive in a later (more contemporary) phase of anthropology rather than an earlier one, during which, in fact, anthropology with its 'four field associations' (physical anthropology, archaeology, linguistics and cultural anthropology) had greater claims on scientificity than other social sciences.

Though there is a trend in anthropology towards disclaiming scientific objectivity (for example, a big debate is going on currently and inconclusively in the pages of *American Anthropologist*), it should not be overestimated. Even so, such as it is, why is this trend (now) apparently stronger in anthropology? It is not that the anthropologist's field is somehow more subjective than other social sciences. In part, it is the discipline's distinct methodology of intensive fieldwork with participant observation, and its typical vantage point perched at the borders of two cultures that brings out in a rawer and more dramatic way, the difficulties of looking at categories in the field through categories derived from academic disciplines (and the vantage point does not necessarily or completely disappear when the researcher and the researched belong to the same broad culture, since the former is still formally trained in the discipline's characteristic mode). This problem is not absent in other social science disciplines but gets masked due essentially to the more focused and specialised nature of their gaze, though the field is the same: one's own or 'other' cultures and societies.

The 'blame your own discipline' syndrome in anthropology is not derivable from postmodern ethnography. It arose in the very definite context of decolonisation. Critical anthropology, and later 'action anthropology' that grew from it have brought to attention the apolitical surface of the discipline which allowed it to gloss over the wider context of inequality in which researcher-researched relationships operated. [For sharply articulated discussions, see Asad 1973, Gough 1968 and 1990, Huizer *et al* 1979]. The not inconsiderable phenomenon of 'native' or 'indigenous' anthropologists looking at their own cultures or those within their national borders, with its potential of bringing in polyvocality to the earlier situation of the monopolistic authorial voice over is not always explicitly or sufficiently acknowledged within the discipline. But it did create pressure points and marked a critical transition in the discipline's self-perception.

The new ethnography represents only one strand of this transition and development. Its primary focus is seen as the interpretation of the text and constitution of ethnographic authority as subjective and contested. There has been sharp criticism about its lack of concern for relations of power and politics [for example, see Keesing 1987 and Scholte 1987]. Indeed, the postmodern turn in anthropology has been seen as a defensive response to the displacement of the singularity of the male white anthropologist by not just the indigenous but the feminist anthropologist as well [Bell 1993:7].

Given feminism's and feminist scholarship's overall orientation towards looking at social reality from a gendered perspective, towards focusing on power relations, taking sides and acting for the transformation of women's situation (and while there are many fierce, internal debates over what constitutes valid action and intervention, there is a broad consensus on the need for it), there is a serious contradiction in equating it *in toto* with postmodernism. The striking commonalities lie in the project of dismantling of 'objectivity'. But the routes taken by the two streams are distinct and independent (and not one of the latter yielding to the former's directives, as Gupta puts it). Having arrived at an awareness of the importance of subjectivity in knowledge through the experience of being dominated, presumably further development in feminist studies may be along distinct routes too. Consciousness-raising through sharing of personal experience of discrimination as well as shared endorsement of the significance of the small and micro level processes of 'women's world' (while demonstrating the lopsidedness of objectivity as another name for male subjectivity) are too rooted in the daily grind of the real world to be postmodern in the currently accepted sense.

But to bring the discussion back to a disciplinary base, anthropology of women is not a recent area of research, nor were the earlier phases necessarily uninformed by feminist questions. Margaret Mead's work is often seen [as, for example, by Sanday 1990:23] as a forerunner to later feminist inquiries. Some of her contemporaries like Phyllis Kaberry and Audrey Richards also,

in some of their work, focused on women and politics are intertwined, that and what was considered to be 'women's sphere': the label was a subtle way in which their 'protofeminist' insights on cross-cultural differences and similarities in the position of women were excluded from serious incorporation within the discipline [see Gladstone 1992]. A more systematic and theoretically grounded critique of patriarchy was developed in the 1970s. It focused sharply on androcentrism but was not equally categorical about eurocentrism. [For a compact reading list, see Bulbeck 1991]. While there were two somewhat opposed positions on the issue of female subordination – universal versus historically evolving subordination – both were preoccupied with power relations between men and women as undifferentiated categories, and a casting of women as passive acceptors and victims. In current research assumptions and approaches of monocausality have largely disappeared, and differentiation of the category of 'woman' is very much on the agenda. Yet the earlier approach gave way to this one with rapidity, with internal linkages, through the weight of its own logic, and through engagement with concrete issues of cultural difference which were focused on by non-white feminists from the west and third world. Often the same people transited from one to the other position [see, for example, reflections by Schrijvers 1989 and Wieringa 1990]. In any case, they definitely stood on the shoulders of the earlier generation and that before it, sharing much in common, even though differing in certain respects. That is to say, contemporary feminist anthropology has a double descent from feminist movement as well as anthropological concerns and cannot be severed from its predecessors in the same genre. It is not derivable from postmodern studies much less postmodern ethnography. This, not-withstanding undoubted isomorphisms.

The areas where recent writings in feminist anthropology appear to be close to the new ethnography are in the greater consciousness of the need for reflexivity and dialogue in the mode of doing as well as writing up ethnography, a recognition of the subjective nature of the fieldwork process, stress on difference and experimental knowledge and on experimental writing of the ethnographic text so as to reflect the presence of the potential readers as well as the writer in addition to the 'field'. The point has been made strongly [by Mascia Lees et al : 11, but also, for example by Bell 1993, and Jennaway 1990] that feminism has anticipated by over two decades several things that postmodern ethnographers are saying now: that culture is composed of seriously contested codes of meaning, that language construction of the other entails relations of domination. But neither postmodern ethnography nor mainstream anthropology acknowledges it, much less engages explicitly with it, which fact itself ought to alert us to some principles inherent in a feminist position which militate against its subsuming in either of the two. Caplan (1992: 85) makes the point that in *Writing Cultures*, a major text of postmodern ethnography, the introduction cites Shostak's 'Nisa' as an example of experimental writing but has not included any feminist contribution as a paper in the volume: a typical left-handed compliment.

The compatibility of anthropology and feminism itself has been the subject of some debate. Strathern (1987), for example, has argued at length that the 'self' of each is constituted by a different kind of 'other' and hence that there are irreconcilable differences between the two. Feminist anthropologists have been conscious of its marginalisation in the academy, i e, within mainstream anthropology. Whereas other disciplines have used anthropological material and insights on women enthusiastically, within the discipline itself, it gets no more than a token bow. It has been allowed to exist, they feel, but not permeate the academy [see especially Caplan 1992 and Jennaway 1990]. The latter points out that this is in contrast to the relative ease and seriousness with which postmodern ethnography has been allowed to engage in centre-stage debate, and suggests that the reasons may have to do with the fact that anthropology continues to be underpinned by a 'paradigm or metatheory which takes as axiomatic the possibility of a neutral epistemology that posits the existence of a realm of pure logic in which cultural abstractions can be made amenable to scientific validation. Feminist anthropology rocks this particular boat in a way that postmodern anthropology does not since the former implies a radical reordering of social relations and the latter only a paradigm shift. According to Caplan (1992), the critical distinction between feminist anthropology and postmodern ethnography lies in the former's insertion of the political, and its sensitivity to power relations, a consciousness that is heightened (though not necessrily created) by women's experience as subalterns.

There is of course a fierce debate within feminism about the 'women as women' line of argument and about the viability of solidarity and sisterhood. It is a complex issue, difficult to take positions on, but one could in a limited sense, see a certain genre of writings of (in the main) women anthropologists (not necessarily feminist) as containing elements that have given anthropology its dialogic and reflexive orientation.

The reflexive tradition in anthropology is best expressed in the 'fieldwork account', that companion volume to the 'real' study

G S GHURYE AWARD FOR 1994

The G S Ghurye Award, instituted in the University of Bombay in 1976, is given to the best work in Sociology or Anthropology. It consists of a cash prize to be awarded annually to an Indian author for a book or monograph which, in the opinion of the Selection Committee, is the best published book of the calendar year. Books and monographs published in India and abroad are to be considered for the award.

The past recipients of the Ghurye Award include M N Srinivas, Veena Das, M S A Rao, Ratna Naidu and T K Oommen. Professor M S Gore has been given the Award for the year 1993.

Suggestions for the 1994 Award are hereby requested. The name of the author and publisher and the title of the book should be sent to the under-mentioned members of the Selection Committee as early as possible.

Professor A R Momin,
Head,
Dept of Sociology,
University of Bombay,
Santacruz (E),
Bombay 400098.

Prof Yogendra Singh,
Centre for the Study
of Social Systems,
School of Social Sciences,
Jawaharlal Nehru University,
New Delhi 110007.

Prof M N Srinivas,
Institute for Social
and Economic Change,
Nagarbhavi P.O.,
Bangalore 560072.

that was often apologetically presented. The process of doing of ethnography seems to catalyse the release of submerged perceptions of the constructed nature of social scientific knowledge. It has been argued that women fieldworkers have done this more deliberately and unambiguously than men [Bell 1993] due partly to working and writing as a woman in a predominantly male profession. Even in 1939 Richards, for example, pointed out how data gathered in fieldwork was selective, and consciously or unconsciously reflected the observer's interests or theoretical approach. Fieldwork was an arbitrary process dependent on the nature of the encounter between the subjectivity of the anthropologist and his or her informants. In this, both anthropologist and informant were affecting each other. Jean Paul Dumont (1978) has noted that publications on fieldwork – the nitty gritty the process – were mainly by women, while men were doing the 'real thing', i.e. when there were husband and wife teams. In such collaborations, women tend to adopt the anecdotal mode [see Caplan 1992]. According to Bell (1993:4) for the most part such accounts by women anthropologists reveal high levels of integration between their professional and personal selves, and by way of contrast Malinowski's 'Diary' in the strict sense of the term raises a host of questions between his professional pronouncements and private preoccupations. Earlier such reflexive accounts of field work were treated as self-indulgent confessionals, but now that men are doing it it is called experimental and given importance. She further shows how women ethnographers' writings show a preference for auto-biography biography and dialogue and suggest their search for a mode of reporting that represents their experience as affective and their knowledge as grounded in specific relations. "Forced always to acknowledge their partial perspective, yet knowing the specific truths of their ethnography, women are thus reflexively predisposed." [Bell 1993:7] In accounts of fieldwork, starting with Bohannon (1954) and Powdermaker (1966) women have been conspicuous for their consideration of the impact of their presence in the field as an element of their ethnography; their personal biographies, age, marriages, children and so on. Such reflections on the gendered nature of the field and fieldwork have made an important contribution to understanding and mapping experience-based knowledge. Yet, they have not been able to bring this into the disciplinary agenda so far.

A final point. What is disturbing as well as puzzling about Gupta's piece are its tonalities. Seemingly, his main attack is on contemporary postmodern feminism. But he is hostile to all kinds of feminism, and feminists except Simone de Beauvoir. The "Kate Millet variant", which he calls an intellectual cripple, was part of a phase where the developing critique of patriarchy had not lodged itself within disciplines and theories. Why brand it as something it did not claim to be and then criticise it for not measuring up? While he seems at one point to concede its activist dimensions by saying that "it served to get things in the open as never before" (and of course it is not surprising that in the given rankings of prestige, he rates activism lower than intellectual activity) but in the very next line he reduces what was brought out in the open to breasts, bodies and swear words and not to issues like domestic double burden, disparity in wages, sexism in the work place and use of women's bodies by the media, which were very much part of the concerns at that time [for example, see Morgan 1970]. While he is severely critical of women in this phase who, according to him, tried to become like men instead of being women in their own right, all he can conjure up by way of imagery when his wish did come true, is lipstick stains on cigarette filters, whereas one could equally evoke other images of partial truths: men (and women) with babies strapped on to their back carry, working in the offices, sharing the nurturing role or closer to home, the rolling pin and thali groups/demonstrating against price rise or even if one is influenced by advertising a sari clad woman going to work driving a snazzy scooter in the traffic jam. Why should contemporary feminists be "adorning board rooms"? Even if one disagrees with their theories surely they are complex and hard hittingly argued at the very least. And why should tinted hair bother him? Is it his case that feminists should not use cosmetics? It could be that Gupta's in expressing his feelings which others share but do not voice for fear of being called politically incorrect (remember Friedan's "the problem that has no name") is straining to make himself heard. If so, his language and style seem to be the equivalents of the nude marches, bra burning and dirty words which he reduces feminism to.

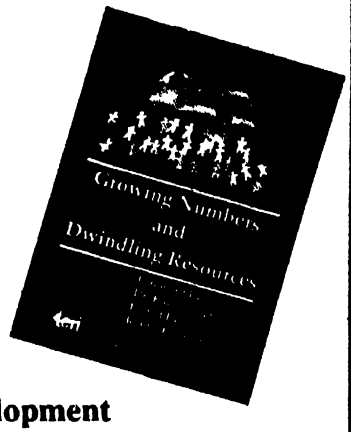
ALL THOSE STUDYING, TEACHING, AND WORKING IN THE AREAS OF ENVIRONMENT & DEVELOPMENT ISSUES



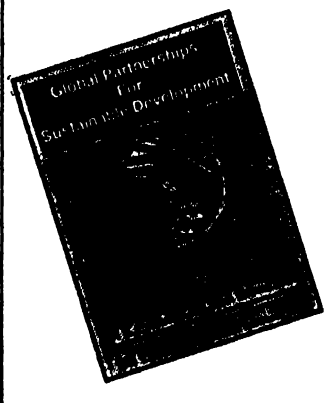
Mahatma Gandhi: An Apostle of Applied Human Ecology

T N Khoshoo

71 pp Softcover Price: Rs 95/- for (Individuals, NGOs); Rs 150/- for (Institutions, Libraries) (Indian) US$ 21.95 (Overseas)

"Dr Khoshoo is an environmental scientist, a dedicated strategist for human survival. This book has a scientist ennumerating the facts and hard hitting realities as espoused by the Father of the Nation..."

The Hindustan Times



Growing Numbers and Dwindling Resources

Edited by Rekha Krishnan, Foreword by Dr Karan Singh

188 pp Hardcover Price: Rs 440/- (Indian) US $44 (Overseas)

"A well produced book, compiling extensively researched papers on the theme of population, environment and development under one cover..."

The Hindustan Times

Global Partnerships for Sustainable Development

Edited by R K Pachauri & Leena Srivastava

150 pp Softcover Price: Rs 280/- (Indian) US $28 (Overseas)

It identifies and addresses vital issues in commercial technology co-operation among the affluent, not so affluent and poor countries and the role of foreign assistance in relation to indigenous capacity building at national, regional and local levels within the Third World countries.

Wealth from Waste

Edited by Sunil Khanna & Krishna Mohan

360 pp Softcover Price: Rs 350/- (Indian) US $40 (Overseas)

This book is an effort to put together the various options available to meet the twin goals of environment conservation and sustainable development. The book also deals with policy instruments and regulatory mechanisms which have been pressed into service in India.

And many more publications on global climate change, joint forest management, cogeneration, energy and environment.

NOW REOPENS FOR SALE
UTI's
PRIMARY EQUITY FUND

An Open-end Growth Fund with accent on Primary Equity

The Fund launched in April '95 reopens for sale now after lock-in period of 90 days. Sale and repurchase of units at NAV based price.

Salient Features

Minimum investment of 200 units and in multiples of 100 units thereafter • No maximum limit • 90% of the funds collected will be invested in equity and equity related instruments. Of the funds mobilised in the initial offer period, upto 50% have been ear-marked for investment in primary equity • Any long term capital gains arising out of the Fund will be subject to treatment indicated under Sections 48 and 112 of Income Tax Act, 1961.

For further details, please contact your nearest UTI branch, Chief Representative or Agent.

UNIT TRUST OF INDIA

For your better tomorrow

All investments in mutual funds and securities are subject to market risks and the NAV of schemes may go up or down depending upon the factors and forces affecting securities market. Past performance is not necessarily indicative of future results. Primary Equity Fund is only the name of the Scheme and does not in any manner indicate either the quality of the Scheme, its future prospects or returns. There is no guarantee that the Fund's objectives will be achieved. Please read the offer document before investing.

Economic Reform and Rate of Saving

The behaviour of domestic saving has been one of the key issues in the current debate on the process of adjustment in the Indian economy following the market-oriented policy reforms initiated in 1991. An important objective of the reform process is to improve the balance of payments position without sacrificing output growth. The attainment of this objective depends crucially on an improvement in the savings performance of the economy. Viewed in this context, the decline in the saving rate since 1991 is a matter of utmost concern and deserves careful examination. **2184**

Urban Planning for Delhi

The interval of almost a decade between the termination of the first Master Plan of Delhi (1962-81) and the beginning of MPD II has been a major factor in the unbalanced spatial expansion of the Delhi Urban Agglomeration and the further growth of a large number of unauthorised colonies, squatter settlements and slums. A review of the current status of urban and regional planning for Delhi and the National Capital Region against the background of these developments, the nature, objects and strategies of the two plans, the relationship between them and the adequacy of the two plans in meeting the objectives set for them. **2191**

Secularism: Beyond Heroic Thought

The sociological distinction between secularisation as a social process and secularism as an ideology is important. The usefulness of this distinction is seen in regard to the minorities question: secularism as ideology divorced from the process of secularisation contributes to the process of minoritisation, leaving the door open for its stated enemies to function legitimately in the political system. **2203**

Failed Ploy

The prime minister's attempt to bring the Planning Commission back to life by calling a meeting of the full Commission was part of his desperate efforts to win back lost political support through populist gestures, but it backfired. **2160**

Checking Malaria

The 1994-95 malaria epidemic in many parts of the country were undoubtedly a result of the breakdown of the administration of the National Malaria Control Programme, but the new action plan adopted recently introduces new technical features without tackling the administrative problems. **2172**

New Banking Culture

The new banking culture nurtured by the economic reforms is alienating not only the small borrower but also the small saver. **2169**

A Setback

The CPI(M)'s attempt to take the offensive by organising a 'victory rally' notwithstanding, the results of the Calcutta civic election, like those of the earlier municipal elections throughout the state, have been a [illegible] for the party. **2171**

Negative Lessons

In the sphere of centre-state relations what we have now is an altogether new ball game. If there are lessons from the past, they are about how not to mishandle problems. **2175**

Uniform Civil Code

Different ethnic, religious and linguistic groups have different traditions and cultures and their personal laws are based on them. Any uniform law will have to accommodate these diversities. **2165**

Agenda for Beijing

Women the world over are concerned that the Beijing Conference should not remain only a meeting point in the history of women's struggles enhanced by the characteristic celebratory space, but also be the time for genuine and committed negotiations when governments will set in motion policies and actions which will secure the advancement of women as equal social and political citizens. **2162**

Autonomy Only Solution

Only steps towards autonomy backed by credible guarantees will provide a lasting solution to the problem in Kashmir. **2167**

LETTERS TO EDITOR

Public Enterprises and Bureaucracy

IN my letter (April 29), I concentrated only on those aspects of Ramaswamy R Iyer's comments (August 20, 1994) on my paper (May 28, 1994) which specifically concern my paper. I naturally did not comment on the unsubstantiated/irrelevant observations made by him but only gave some examples. Iyer responds (June 24) by claiming that "I stand by the truth of that account" and by asking "what power can truth or logic or reasonableness have over an obstinate adherence to myth and fable". What he now actually offers as evidence in support of his statements is that he has received "confirmatory and appreciative letters from a couple of distinguished contemporary observers/actors". Henceforth one need not substantiate what one says: it seems it is enough to keep track of the number of confirmatory letters received! Following Iyer's style, I am prompted to say 'amazing performance', but unlike him I am not left speechless. I really do not expect much from some of our 'senior' bureaucrats. We are aware of their culture to consider what bothers them as truth and what others say as myth. Iyer ignores that his account is not the only one known to the readers. As mentioned in footnote number 3 in my paper, my discussion on the Planning and Development Division of the Fertiliser Corporation of India (P and D), which incidentally is only a very small part of my paper, is based on two studies. Neither of these studies supports what Iyer says. Between these two studies and what Iyer says, I have no hesitation in accepting the former because the opinions expressed are consistent with the logic and facts provided.

In my paper, I did not say that planning or public enterprises in India have not achieved anything. In the very first paragraph I pointed out that some PEs, e g, BHEL, have significant achievements to their credit. But I did say (which I think is generally agreed) that the performance of the PEs on the whole has been less than their potential and below the expectations with which they were set up. Without the industrial policies pursued particularly in the 1950s and 1960s, many of the PEs would not have existed today. But after being set up, if these PEs had received greater attention and support from our policy planners, then they would have been much stronger today. In fact, following the logic that zero is greater than a negative number, if some of our decision-makers in New Delhi in the later period had shown less 'interest', if they had left matters to people who understand technology and believe in indigenous development, then the situation would have been far better.

Iyer tries to defend the decision to go in for the 1,350 TPD ammonia plants initially by mentioning that the secretary (chemicals and fertilisers)... "agonised for a long period over the choice..." and now by observing that the induction of these plants was quite smooth and they did not experience any special problems in commissioning and thereby implying that if P and D had been given the responsibility then 'endless troubles' would have been faced. What P and D was trying to do was something new for an indigenous enterprise in a third world country. Naturally, problems are not unexpected particularly when compared with the much more experienced international organisations. We believe that with proper strategic planning and support, P and D had the potentiality to become an internationally competitive organisation. Such planning and support however were absent. In fact there was a lot of opposition to P and D. In view of the promise shown by P and D and the statistics quoted in my paper that 1,350 TPD plants were even internationally not the standard size and that at 80 per cent capacity, the smaller plants can be more cost effective, I think I am justified in questioning the motivation of the decision favouring the 1,350 TPD plants. I repeated these statistics in my last letter, thinking that Iyer had missed the relevant footnote in my paper. In his latest letter too he is totally silent on these statistics. Obviously he has more confidence in his opinion than in hard facts.

Iyer accuses me of sweeping generalisation. Let me again reiterate that I did not say that all bureaucrats/technocrats join World Bank/TNCs or that they do not pursue national interests. But I do believe that some of them, whether they join World Bank, etc, or not, do not pursue national interests.

SUDIP CHAUDHURI

Calcutta

Dissolution of Orissa Local Bodies

THE dissolution of the elected bodies of the panchayats and municipalities by the Orissa government on August 2 is a blatant attack on democracy at the grass roots level. Elections were held to these bodies in 1992 and they had a legal tenure of five years. The recently elected Congress(I) government of Orissa has taken a partisan decision to disband these bodies evidently because a little over a majority of them had Janata Dal in power. The habit of dismissing opposition party governments at the lower level has caused havoc with our democratic process. In a multi-party system each party in power has to co-exist with the others and politically compete with them at the legitimate time.

The Orissa government invoked Article 243N in case of the panchayats and 243ZF of the Indian Constitution for the municipalities and got a resolution passed in the state assembly saying that the laws under which these bodies were operating were inconsistent with the 73rd and 74th amendments and therefore they be dissolved. The publicly stated reason is hardly convincing because even the Congress(I) government at the centre had not pointed out the alleged inconsistency after the constitutional amendments. In fact the state law was modelled after the central draft which was already circulated.

It should be pointed out that unlike under Articles 243E and 243U there is no reference in these provisions to holding fresh elections within six months of the dissolution. In other words there may not be any elections to the panchayats and municipalities in Orissa for an indefinite period. This is in clear violation of the spirit of the Constitution 73rd and 74th amendments and the provision 243E and 243U. It is sad that the period of experiment in democratic decentralisation with one-third representation to women and other statutory forms of reservation has been cut short abruptly. Orissa which took pride in pioneering panchayati raj in the new phase has slipped back once again to the era of suspended institutions and irresponsible governance.

We call upon democratic forces all over India to protest against this decision and help people of Orissa in their struggle for panchayati raj.

MANORANJAN MOHANTY,
GEORGE MATHEW

New Delhi

Indian Entrepreneurship

NASIR TYABJI's article (July 29) made a refreshing change in the *EPW* agenda (July 29). I was under the impression that earlier than the establishment of the government Industrial Institute in Madras in 1919, similar efforts were in progress in the north at Modinagar, Kanpur, Calcutta and Benares. Manufacture of boiled lineseed oil, an important raw material for the production of printing ink and paints and varnish was taken up by industrialists like Gujar Mal Modi, Juggi Lal Kamlapati Singhania and some Bengali entrepreneurs in Calcutta and Benares. Eminent industrial chemist P C Ray also inspired Pandit Madan Mohan Malviya and one of the important activities in those days at Benares was the manufacture of boiled linseed oil, neem soap and washing soap free from animal tallow. These were based on Indian know-how.

It would indeed be quite useful if someone undertakes a study of such historical technological developments. I suspect that such industrial activity motivated Raja Baldev Das Birla to undertake the packing of meat to meet the armed forces' demand during the second world war. In those days this created a stir in Marwari society – that Birlaji should do this kind of work for money. Malviyaji did not disapprove and helped in arranging finances from the maharaja of Baroda.

S K SHARMA

Delhi

Farce of Drug Control

THE Drug Controller of India constitutes the final authority on the manufacture, sale and promotion of pharmaceutical products in the country. For aiding the controller and for the implementation of the Drugs and Cosmetics Act, 1940 two technical bodies are constituted, the Drug Technical Advisory Board (DTAB) which advises the state and central governments on the technical aspects of enforcing the act and the Drug Consultative Committee (DCC) to render advice to the governments and the DTAB. While the former is expected to give expert technical advice and therefore comprises technically competent personnel such as the directors of the Central Drug Laboratories, the various research institutes, the presidents of the pharmacy and medical councils, representatives of the Indian Medical and Pharmaceutical Associations and the Indian Council of Medical Research. In other words, the DTAB and the DCC are authoritative statutory entities invested with expertise whose advice, it would be presumed, is needed and heeded by the drug controller, except where administrative problems prevent such acceptance.

About 15 years ago, the Drug Consultative Committee, on the advice of the DTAB, had recommended that several categories of harmful/irrational fixed dose drug combinations be weeded out. The health ministry in a gazette notification of July 23, 1983 banned 22 of these categories. The date is an important one in the drug consumer activists' notebook, for the ban, challenged by drug companies at numerous levels and in different courts in the country, is yet to be enforced. Interestingly, industry's objections to the ban in most cases in court, had not questioned the experts' basis for banning the drugs. Many of these products had already been withdrawn in other countries by the companies themselves, standard textbooks and sources acknowledged that all of them were of doubtful efficacy, some were even dangerous and most of them had been recommended for withdrawal by several reputed authorities abroad. Faced with this state of affairs, the Drug Action Forum, Karnataka, a couple of years back petitioned the Supreme Court seeking implementation of the ban with the added plea, in a co-petition, to expand the list of harmful/irrational drugs to be banned. Given that this required a technical review of the ban list and taking into account the consumer movements' criticism that the DTAB had not given sufficient weightage to consumer needs, the Supreme Court instructed the DTAB to co-opt three experts of independent standing in late 1994.

What has happened subsequently is a mockery of the independent authority vested in the drug controller to regulate and monitor the production and sales of drugs in a manner that they benefit the large mass of the people. In a detailed note to the Supreme Court, the three co-opted members have pointed out the errors of omission and commission on the part of the drug controller who is responsible for convening and conducting the meetings of the DTAB. The note points out, for instance, that the briefs prepared for the DTAB members were never sent to the co-opted members before the meetings; while the material submitted by the drug companies was circulated among the members, the petitioners' contentions were unavailable; remarks made by the three members were selectively incorporated in the minutes of the meetings in such a way that they appeared to support the views of the drug companies. For instance, one of these members had opined that of the six drugs being discussed, two perhaps need not be banned. The report on the meeting deliberately left out the fact that the member had supported the move to ban the four drugs. Distortion of opinions has also occurred on the issue of the need for fresh clinical trials, which the drug companies had stated as being necessary in order to assess the drugs' relevance and efficacy. Curiously enough, the drug controller appears to have raised no objection to the fact that in the volumes of material submitted by the drug industry there was not a single quotation from a standard source and, further, that a large proportion of the material was irrelevant to the drugs under discussion and, even more interestingly, large sections were in German with no translations provided. In general, most of the references provided were from stray research studies, often of doubtful veracity.

It is not that the Drug Controller of India or his counterparts in the states have ever been held up as models of efficiency or objectivity. Nor have their offices been known for their committedness to the welfare of the people. The Lentin Commission, whose excellent report and extensive recommendations on the reorganisation of the Maharashtra state drug control authority have long been mothballed, had exposed the deep-rooted influence that drug producers have over the drug control authority. That the proceedings of the first and only public enquiry instituted by the DCI, again at the instance of the Supreme Court, on the issue of the estrogen-progesterone combination drugs were structured deliberately to favour the drug companies hardly needs to be recalled. If today India has this large array of unwanted, unnecessary and irrelevant but extensively promoted, advertised and marketed drugs which contribute to the spiralling private medical expenditures, it is a measure of the gross dereliction of duty by the drug control authority. And it is most unfortunate that the only agency today which may bring a semblance of balanced functioning to the DCI is neither the political nor the executive authority, but the judiciary.

PUNJAB

Limits of Patch-Work

THE assassination of the Punjab chief minister, Beant Singh, carries a lesson which goes beyond the narrow concerns for security of VIPs. The more fundamental issue of how to deal with armed militancy that is rooted in popular grievances has resurfaced. The bomb that killed Beant Singh has also blown to smithereens the assiduously cultivated myth that unfettered strong-arm tactics are enough to finish off insurgency in any part of the country. K P S Gill, the Punjab director general of police, who has been the main architect of this myth, was given a free hand by Beant Singh as demanded by him. Gill and the chief minister have been patting each other on the back all these months claiming that peace had returned to the strife-torn state. But Thursday's event proved that it was a deceptive peace.

It is apparent now that what Gill had managed to bring about during the last three years (since Beant Singh's assumption of chief ministership) was a temporary lull on the terrorist front, by forcing some of the terrorists to flee Punjab and take refuge in neighbouring states, and others to lie low. The main victims of Gill's anti-terrorist drive have been, as usual in such operations, innocent men and women of Punjab villages – as evident from frequent reports in the press and by human rights groups. It seems that taking advantage of the complacency fuelled by the lull, the terrorists – or at least one group (the Babbar Khalsa International which has owned up to the killing) – have regrouped themselves to strike back. The fact that the blast could take place inside the high-security precincts of the secretariat indicates the extent to which the group could infiltrate into Gill's own security apparatus.

In the Indian situation, peaceful attempts at governance by the civil administration and coercive efforts to impose law and order by the police and military are both equally vulnerable to perversion. Just as corrupt politicians and bureaucrats can buy their way out of the courts, terrorists and militants can buy their way into high-security areas – reducing the entire strategy of VIP-security to futility. As long as the political system and the administrative structures continue to wear thin and crumble, no amount of patch-work by the centre can change the ground reality either in Punjab or Kashmir.

The assassination in Chandigarh must have upset the centre's plans for Kashmir. The Punjab experiment – an elected ministry (in spite of a poor turnout of voters and boycott of the elections by the Akalis, the main opposition) followed by a combination of tough anti-terrorist steps and placatory economic measures to bring about a semblance of peace and prosperity – is being peddled by Narasimha Rao as the model for Kashmir. With this objective in view, Rao is planning to hold elections in Kashmir at the end of this year. If he can pull off the deal in Kashmir, he hopes to use it as a feather in his cap in the coming Lok Sabha elections.

But Beant Singh's assassination, apart from creating the immediate problem of deterring candidates from jumping into the election fray in Kashmir, should serve as a warning to the centre against its propensity towards cosmetic solutions of deeply entrenched political and economic problems. A hurriedly manipulated election, followed by the continuance of repressive policies (legitimised by so-called representatives of the people), can sweep under the carpet popular discontent and other problems for some time. But they will erupt into morbid bursting carbuncles on the body politic every now and then at unpredictable moments, as happened in Chandigarh.

KERALA

Clinging to Privileges

IN Kerala the dominant political view being taken is that the backward castes, including the scheduled castes and tribes have to be specially provided for in appointment to government jobs and promotions in addition to admissions to educational institutions, regardless of whether the beneficiaries of such reservations belong to the 'creamy layer', the layer of those among the backward castes and classes which has already made good economically. This view prevails among almost all political parties (there is no dearth of them in the state) except the CPI(M), a party with a major popular base no doubt. Given the prevailing view and the arithmetic of the partywise distribution of seats in the state assembly, it should not surprise anyone if the bill before the special assembly session to continue the existing reservation system, nullifying the Supreme Court order to the state to exclude the creamy layer, goes through. The statement of objects and reasons appended to the bill justifies the continuation of the existing reservation system on the grounds, first, that there exists a creamy layer among the backward castes and classes which has acquired the capacity to compete with the forward castes and classes and, second, that the backward castes and classes are still under-represented.

It is noteworthy that in both these arguments there is nothing really new that the present UDF administration in Kerala and the supporters of the move within even the opposition LDF are advancing. Denial of the existence of a creamy layer among the backward castes and classes, and that too in a state such as Kerala, is a charade. If there is one state where many among the backward castes and classes other than the SCs and STs have benefited enormously and risen substantially in the income scale, it is Kerala and the state should be proud indeed of this achievement instead of denying it. The reality is sought to be denied by political parties only to retain the electoral support of the articulate elite among these castes and classes who simply do not want to share the spoils that have nurtured them with those among them who have been denied the benefits of the reservation system. In this context, it ought to be noted that even the CPI(M)'s position is not totally in favour of abiding by the Supreme Court judgment on the issue. Its position, simply stated, is that while reservations should stay, the first claim to them should be of those among the backward castes and classes who are not from the creamy layer. Only if no one emerges from the non-creamy layer should the job, promotion or admission go to the creamy layer belonging to these castes and classes. So even the CPI(M) position accepts the continuation of reservation for the creamy layer; it only prioritises the choice within the backward castes and classes (this is not what the Supreme Court intended). The other parties are opposed to even this prioritisation within these classes. Why? Obviously, the creamy layer wants to hold on to its privileges.

CRIME AND POLITICS

Diversionary Tactics

WE did not need to be told how serious the criminal-politician-bureaucrat nexus is by, of all bodies, the Vohra committee – which has not dared even to mention the names of certain former chief ministers and politicians whose camaraderie with underworld dons is an open secret and some among whom actually figure in police diaries. The profound discovery by the committee that crime syndicates and mafia organisations in various parts of the country have established linkages with government functionaries and political leaders had long ceased to be news for the average Indian citizen. The people's daily experience in different states, and under political regimes of every hue, has forced them to accept criminalisation of politics, in much the same way as they have learnt over the years to take in their stride things like nepotism and skulduggery by ministers, racketeering by politicians whom they elect to state assemblies and parliament and bribery among government officials whose palms have to be greased to obtain services which in the normal course should be available to every citizen as a matter of right (such as free medicines in primary health centres in villages or telephone connections in cities).

Given this situation, the Vohra committee's report – if we accept the home minister's claim of its having been presented to parliament without any expurgation (as

alleged by the opposition) – is a d squib. The insipidity of its contents makes one wonder why the ruling party had been sitting tight on it for the last two years. Set up by the government in the wake of the 1993 Bombay blasts, the committee had come out with its report quite some time ago. The recent revelations about a Youth Congress politician's alleged murder of his wife in the capital sparked off a public debate on the patronage of criminals by political parties and put pressure on the ruling party to take a stand on the problem. As popular disenchantment with the Narasimha Rao regime got reinforced by the exposure of a high-profile member of his party being involved in a ghastly crime, Rao chose the moment to release the committee's report.

Although the move is being advertised as a mark of the government's readiness to be 'transparent' and share even a confidential report on a highly sensitive subject with the people, the Vohra committee's report actually serves to divert attention from the widespread public complaints about the criminal-politician-bureaucrat axis which has become a menace to the common citizen, whether in the villages or cities. The report highlights only the threat to national security, posed by smugglers mainly, who enjoy the protection of local political leaders and who allegedly were used by Pakistan's ISI to plot the Bombay blasts. What about the other dimensions of the axis, as manifested in the daily suffering of the dalit villager terrorised by criminal musclemen in the party of the local landlord-politician, protected by the district administration? Or the urban middle class citizen bullied into selling his/her property or into submitting to demands for extortion payments by the local mafia patronised by MLAs and MPs and protected by the police? By ignoring these everyday manifestations of the criminal-politician-bureaucrat nexus at the ground level and trying to turn our attention to the larger international nexus and elevating it to a threat to our 'national security' by concentrating on the Bombay smugglers' mafia and its responsibility for the 1993 blasts, the Vohra committee has offered prime minister Narasimha Rao the opportunity to use its report to reduce the entire issue of criminalisation of the Indian political system to one of a Pakistani conspiracy to exploit the Bombay underworld to carry out sabotage and subversion.

The simplistic explanation of criminalisation of Indian politics by blaming Pakistan is matched by the similarly puerile explanation, offered by the Vohra committee, for the Indian state's failure to tackle the problem. The submissions made to the committee by the various government agencies – RAW, CBI, IB, etc – have led the committee to the conclusion that it is the lack of co-ordination among these bodies that is mainly to blame. Following up on the committee's recommendations, therefore, the government has promptly set up another committee – a five-member so-called nodal cell which will be charged with co-ordinating the operations of the different intelligence, investigative and enforcement agencies. But is it the lack of co-ordination, or of the political will of the powers that be, which has thwarted effective action against the mafia dons and the criminals who terrorise the countryside? But why talk of even lack of political will when the actual situation is that influential politicians actively intervene to protect the criminal underworld with which they have developed a mutually-beneficial symbiotic relationship.

It is not surprising, therefore, that soon after the much-publicised submission of the Vohra committee's report to parliament, the home ministry has decided to wind up the special Delhi police cell that had been set up to investigate the killing of 3,000 Sikhs in the capital in 1984. Among those accused of involvement in the massacre – some of whom have in fact been indicted by judicial commissions – are prominent Congress leaders with underworld connections who continue to hold important positions in the party organisation.

A correspondent adds:

THE non-seriousness with which the government of India approached the issue of the criminal-politician-bureaucrat nexus is evident from the brief given to the N N Vohra committee. The government order of July 1993 had stressed the 'links' between crime syndicates and bureaucrats/politicians in the wake of the Bombay blasts. Taking the cue, the committee has in its report faithfully highlighted the alleged link between Pakistan's ISI and the Indian underworld. It concludes that the Bombay blasts and the communal riots in Surat and Ahmedabad demonstrated how the underworld had been used by the ISI. The committee ignores altogether the larger political developments against which these events had taken place. For instance, there is no mention of the demolition of Babri masjid and the anti-Muslim carnages that had preceded the Bombay blasts. The suborning of the executive, the legislature and the judiciary had taken place on a much larger scale around the demolition of the Babri masjid. A more balanced exercise than that carried out by the Vohra committee would have, therefore, at least acknowledged that the ubiquitous ISI was able to exploit the underworld here for furthering its objectives only because of the circumstances created by the demolition of the Babri masjid and the killing of Muslims in Bombay and elsewhere in the country.

The perversity of the committee's terms of reference is also exemplified by the exclusion from the committee's purview of the nexus among bussiness, crime and government functionaries – as manifested in the 'havala' racket or the assassination of a popular trade union leader like Shankar Guha Neogi. Because those engaged in white-collar crime enjoy patronage and protection at the highest levels they are seldom, if ever, punished. By focusing attention on criminal gangs enjoying the patronage of 'local level politicians' the committee diverts attention away from the growing criminal activities of political and so-called 'cultural' organisations which are left free to pursue their objective of whipping up hostilities between communities. These organisations mask their crimes behind the pretence of righting 'historical wrongs' and target their activities at creating communal vote-banks. Their operations, therefore, deserve the most careful notice in any investigation of the criminalisation of political and social life.

It is ironic, but altogether apt, that the official agencies which are represented in the so-called 'nodal agency' set up following the Vohra committee's recommendations already stand compromised by their role in such landmark cases of large-scale governmental malfeasance as Bofors and the stock market scam, not to mention again the demolition of the Babri masjid. They have often deliberately prepared cases in such a manner as would not stand judicial scrutiny. Thus the ban on the RSS and the VHP after the demolition of the Babri masjid were conveniently linked to statements made years ago, scrupulously leaving out any mention of their role in the organised destruction of the mosque on December 6, 1992. There is also the more recent example of Iqbal 'Mirchi', who finds mention in the Vohra committee's report as an instance of the growth of a small-time functionary into a major crime syndicate. The CBI's three chargesheets against him are so flimsy and bereft of substance that they can be depended on not to secure his extradition, much less his conviction by an Indian court. However, despite their established incompetence, prejudices and malleability, these agencies continue to demand and to be granted extraordinary powers and additional resources. For instance, the IB told the Vohra committee that government should give "total freedom to the various agencies"; the CBI demanded wider powers of preventive detention, tapping of telephones and conduct of surveillance, establishment of new monitoring mechanisms at the central and state levels, summary trial procedures and review and amendment of existing laws to that end. And just as TADA has led to innocents suffering even as the graphs of crime and terrorism have risen dramatically, the setting up of the nodal agency, working outside the control of parliament, and conferring further draconian powers to agencies which have in the past proved unequal to the tasks entrusted to them are likely to aggravate the problem instead of providing solutions to it.

IRAQ

More than a Family Feud

A FALL-OUT of the Iraqi occupation of Kuwait in August 1990 was the imposition of a US-led economic embargo on Iraq. The relevant UN Security Council resolution stipulated that the embargo would be lifted only when Iraq had dismantled all mass destruction weapons systems under UN supervision in such a way that it would not be able to develop such systems in future. After its defeat in the Gulf war, Iraq had accepted this resolution in April 1991 and, ever since, had apparently complied with the requirements of the UN Special Commission (UNSCOM) which was to oversee the dismemberment of the weapons systems.

Thus, on the eve of the defection from Iraq of president Saddam Hussein's two sons-in-law, UNSCOM was on the verge of recommending the lifting of the embargo, an event eagerly awaited by Russia, China, France and others which are interested in resuming trade with Iraq. But the defection and the suspicion it has given rise to, namely, that Iraq is withholding information about its secret weapons systems, will further delay the lifting of the embargo.

While, on the one hand, this will greatly add to the suffering of the Iraqi people – the worst hit being children and the aged – who are being deprived of essential supplies from abroad, it will, on the other, help consolidate the domestic political opposition to the regime of Saddam whose own authoritarian ways have in no less measure brought hardships on the people of Iraq.

It is from this perspective that the defection of Saddam's sons-in-law, along with his daughters, and the subsequent US muscle-flexing on the borders of Iraq need to be viewed. As much as a power struggle within the ruling family, the defection represents the suppressed anger of a section of the people and elite of Iraq against Saddam who, in the last one decade and more, has led the country from one avoidable war to another and from one economic and political disaster to a greater one. While it would be a gross misrepresentation of the facts to blame Saddam alone for the present denouement in Iraq - given the well known role of the US and its allies in the Gulf war and in the Iran-Iraq war before that – it would be equally a mistake to ignore the undemocratic character of his regime which allows him and his advisors to take decisions which prove costly to the nation.

Observers sympathetic to Saddam - and their number is legion – gloss over certain of his actions by pointing to the allegedly socialistic orientation of his regime or by juxtaposing him as a third world David against a first world Goliath, the US. Yet no regime in which all political power is monopolised by one family or by a minuscule section of the elite can legitimately be called socialist. Nor does a third world government which flagrantly violates international law and basic human rights deserve much sympathy.

The sons-in-law of Saddam and his daughters have partaken of the bounty their former mentor made available to his family, and if their defection were merely a move in the power struggle within the family fold, then they should expect little support. Similarly, the US and its allies had no business engaging in troop movements along the Iraqi border if there had been no such moves from the Iraqi side. However, feuds in ruling families are rarely other than a symbol of larger stirrings in society and, if one were to go by what the defectors say, before the US, Jordan and Kuwait preponed their military exercises, Iraqi troops had already reached the 32 parallel which a UN resolution forbids them to cross.

BOSNIA

West's Game

THIRTY-SEVEN killed and a hundred injured in the latest artillery shell attack on the capital of Bosnia. The worst, we are told, in 18 months. And Sarajevo is supposed to enjoy UN protection which has lately been beefed up by NATO's rapid reaction force. This time, perhaps, there will be some response to this shell attack, from the ground or air or both. And perhaps the response this time will not be as timid as before. The risk of UN troops being taken hostage has nearly been eliminated – with practically all of them having been withdrawn from vulnerable spots.

Whatever the UN (read NATO) response, the basic question to ask is whether the Yugoslav conflict would be any closer to solution as a result. The west's approach right from the outset has been to let Yugoslavia splinter. The old imperialist formula of 'divide and rule' has been very much in evidence in its approach to this conflict and it is doubtful that today, after five years, there is any change in that approach, notwithstanding the responses to events as they occur from time to time. Already, Yugoslavia today stands divided between the Serbs who are orthodox Christians, Croats who are Catholics and Bosnians who are Muslims. A nation which professed and practised secularism for decades stands fractured on religious lines and is now led largely by racists and fanatics, not because people have been converted to fundamentalism and fanaticism but because the conflict thrives on these vile forces.

What is being currently canvassed as the Contact Group's peace proposal is nothing but a partition scheme. The ethnic cleansing that had been going on over the years of conflict will thus have been endorsed. But the wounds of partition thus inflicted will not easily heal.

The partition of Yugoslavia was never the right solution. Nor is the partition of Bosnia. A long-term solution will have to be sought in terms of a decentralised but unified Yugoslavia and within it Bosnia. The Muslims of Bosnia would certainly be feeling utterly scandalised at being bracketed with countries and communities practising and preaching fundamentalist Islam. But they are being pushed more or more into the arms of such countries. The same is possibly true of the Croats and the Serbs, at least of the majority among them. Why not tap these sane elements and build on their strength?

BOMBAY DYEING AND MANUFACTURING

Riding the DMT Boom

ESTABLISHED in 1879, Bombay Dyeing and Manufacturing Company, India's largest producer of polyester raw material DMT, manufactures cotton textiles and non-woven fabrics and also carries out bleaching, dyeing, and sanforising. A 76 per cent increase in turnover, from Rs 524 crore to Rs 922 crore, an increase of around 80 per cent in total income and a rise of 92 per cent in profit after tax from Rs 51 17 crore to Rs 98 09 crore were some of the highlights of the company's performance for the year ended March 1995. Net profit could have been higher were it not for a tax provision of Rs 16.75 crore against zero tax provision in the previous year. The company has proposed a dividend of 55 per cent.

Exports by the company in 1994-95 rose to Rs 94 15 crore, up by 46 per cent from Rs64 31 crore in the previous year. A massive increase of around 221 per cent was seen in imports. Imports of raw materials rose from Rs 56 69 crore to Rs 220 09 crore, a possible reason being rise in the price of paraxylene, an important input for DMT. For every tonne of DMT produced, raw material consumption is 0 65 kg of paraxylene and 0 42 kg of methanol.

Bombay Dyeing has transformed its business from that of a textile major by diversification into manufacture of DMT. The DMT division's contribution to the company's earnings has gone up sharply, overtaking that of the textile division. The company has a 67 per cent market share in DMT, followed by IPCL and BRPL.

Bombay Dyeing's performance in 1994-95 comes against the backdrop of rising cotton and paraxylene prices, the main raw materials for the company's textile and DMT divisions. The prices of these items have more than doubled since mid-1994, putting a severe squeeze on margins. The sales turnover of the DMT division was Rs 588 56 crore against Rs 169.16 crore in the previous year. The division's contribution to the company's turnover crossed 50 per cent because of the expansion in capacity and the increase in DMT prices. Capacity increased from 43,969 tonnes to 1,13,733 tonnes. The increase in DMT prices was the outcome of a variety of factors. With a global shortage in PTM/DMT and no fresh PTA supplies coming up, polyester units having dual feed capacity shifted to DMT considering that supplies from Bombay Dyeing were at least assured. The cutting of supply of PTA (Purified Terepthalic Acid), the alternative to DMT by Reliance, its main competitor in the domestic market, because of captive consumption, also worked in the company's favour. Slashing of the import duty on paraxylene from 30 per cent to 10 per cent in the 1995 budget was offset by rising international prices of paraxylene which have moved up from $ 750 per tonne in January 1995 to around $ 1,800 per tonne. Reduction of duty on DMT also did not help because of rise in international prices, which were around $ 550 per tonne in January 1994 and doubled to $ 1,100 per tonne by January 1995 and at present are $ 1,500 per tonne. Bombay Dyeing being dependent on imported paraxylene, raised its price but still found its margins squeezed. Though the company has justified the hike in DMT price on grounds of rising costs of paraxylene, it seems that Bombay Dyeing has more than covered the increased costs. Paraxylene costs constitute nearly 30 per cent of the raw material costs of the company and, in view of the rising prices, the company is exploring the possibility of a tie-up with a public sector undertaking for the manufacture of paraxylene. It is also talking to Hindustan Petroleum Corporation for a tie-up for naphtha needed for the paraxylene project. All in all the DMT division has done very well, riding the petrochemicals boom.

The performance of the DMT division in 1994-95 cannot, however, be comparable with that in the previous year because then capacity expansion had led the DMT plant to be shut down for an extended period in May December 1993. The company, has a monthly capacity of roughly 13,000 tonnes of DMT. This might be expanded to 14,000 tonnes by November-December through debottlenecking of its plant at Patalganga in Maharashtra. The world demand for various petrochemicals, in particular DMT, has risen sharply and the company expects it to remain firm throughout the year and is therefore increasing its capacity from 1,12,000 tpa to 1,45,000 tpa in the current year and eventually to 1,60,000 tpa. According to D Alva, managing director, the company is one of the top 20 producers of DMT in the world.

The textiles division, traditionally the largest contributor, chipped in with a smaller share of 45 per cent in 1994-95. The division was not able to perform well because of many factors. Cotton prices were on the rise, more so between October 1994 and February 1995, leading to erosion of margins for the company from its textile operation. Cotton prices in November, the peak arrival season, were higher by about 80 per cent over those in the corresponding period of the previous year, thanks to a lower than expected cotton crop coupled with continued high demand for cotton and speculative pressures. This was coupled with an increase in infrastructure costs and government levies. The turnover of the textile division in 1994-95 was Rs 480 crore against Rs 400 crore in the previous year. Exports were Rs 165 crore.

The company spent Rs 75 crore on export-oriented textile modernisation to improve its global competitiveness. According to Nusli Wadia, managing director, "modernisation will, however, no longer be confined to equipment and will cover modernisation of work methods and management practices". The company is also holding talks with global textile leaders to bring in their brands and sell them through its 600 strong chain of retail shops. The company plans to go in for a new plant outside Bombay to manufacture towels to more than triple its existing capacity from 3 tonnes per day to 10 tonnes per day. Also on the anvil are plans to open more exclusive shops besides a major upgradation of the existing outlets in order to strengthen the domestic marketing network. According to Wadia, retailing in India will shift more and more to selling ready-to-use items.

Many plans for diversification into power, telecommunications, leasing/hire purchase, shipping and infrastructure development have been passed but no concrete projects have emerged except in the power sector. The company has short listed Rajasthan as a site for the power project.

The company plans to set up a plant to manufacture paraxylene which the company now imports. The company will face stiff competition when the PTA plant of ATV Petrochem and the PTA capacity expansion by Reliance Industries become operational by 1996.

SPECIAL STEELS

Higher Turnover

Special Steels (SSL), a former subsidiary of Tisco and a leader in the production of steel wires, has posted improved performance for the year ended March 1995. Turnover was up by 52 per cent from Rs 356 crore to Rs 541 crore. Income from investments rose from Rs 10 lakh to Rs 110 lakh. Interest costs moved up by 39 per cent and there was a 26 per cent rise in depreciation provision. Like in the previous year, the company has made no provision for taxes. There was a net profit of Rs 26.16 crore, up by 367 per cent from Rs 5.64 crore in the previous year. The results for the year under review take into account the assets and liabilities and income and expenditure of Tata Metals and Strips which was amalgamated with the company in March 1995. The company recorded production rises of 10 86 per cent in billets and around 12 per cent in wire rods.

Of high-value flat products, the company posted a production rise of 40 per cent.

Exports increased to Rs 35.75 against Rs 26.09 crore in the previous year. The company exported 16,900 mt of steel wires, 200 mt of wire rods and 3,500 mt of cold rolled strips. Exports of the cold rolling unit which began last year were further strengthened with new markets being located in South East Asia. Imports rose from Rs 27.89 crore to Rs 52.02 crore, an important reason being the import of finished goods worth Rs 10 crore. A dividend of 30 per cent has been recommended against 25 per cent in the previous year.

The company's Tarapur plant produces tyre bead wires, pre-stressed concrete wires and cold rolled sheets, while its plant at Borivli makes wires. The production at the cold rolling mill increased to 58,500 tonnes against 14,900 tonnes in the previous year, with the company catering to most of the leading players in the automobiles and appliances industry. Tata Metal Steel has its hot-rolling division at Sisodra and cold rolling facility at Navsari in Gujarat. The production of 57,200 tonnes of hot rolled strips at Sisodra was marginally lower than the production of 58,000 tonnes in the previous year. The unit at Navsari achieved a production of 19,600 tonnes of cold rolled strips which was higher by 20 per cent compared to the previous year. Reversal of the recessionary trends in the automobile sector augurs well for the industry and translates into a better market for cold rolled products.

The company is coming out with a rights issue of 14 per cent partly convertible debentures (PCD) of the face value of Rs 100 each to existing shareholders in the ratio of one PCD for every five equity shares held. Each PCD will have a convertible portion of Rs 50 to be converted into one equity share of Rs 10 at a premium of Rs 40, as well as a non-convertible portion of Rs 50. Ishaat Hussain, chairman, said the issue would be made by the end of this year and proceeds would go to part finance the proposed capital expenditure plan of the company.

The company's wire plants at Borivli and Tarapur have been accredited with ISO 9002 by RWTUV Germany, the certification covering the entire range of steel wires being produced by the company.

CENTURY ENKA

Rise in Raw Material Costs

Century Enka, a B K Birla group company manufacturing nylon filament yarn, polyester filament yarn, polymer resins, engineering plastics and tyre cord fabrics, has closed the year ended March 1995 with a dismal performance. Net sales have fallen by 24 per cent from Rs 362 crore to Rs 274 crore. Total

income came [illegible] 277 croe, a fall of 28 per cent. Lower provision for interest and depreciation could not prevent a sharp fall in net profit from Rs 23 crore to Rs 8 crore.

This lacklustre performance has been attributed by the management to a prolonged lock-out at the company's Pune plant. Added to this were the floods in July last year and the panic created by plague in September in Surat, the largest consuming centre for PFY, both of which seriously affected the working of the textile industry creating an adverse impact on the prices of PFY. The difficulties were compounded by the steep rise in the price of raw materials like DMT, PTA and MEG in the international and domestic markets and the benefit of the lowering of import duties in the 1995-96 budget were lost. Prices of raw materials like DMT , PTA, MEG and caprolactum are currently 50 to 80 per cent higher than those of March 1994. The company has nevertheless proposed a dividend of 42 per cent.

The company's exports increased from Rs 1 crore to Rs 6 crore, It achieved considerable success in export of polyester filament yarn and efforts in that direction are continuing. Imports came down from Rs 28 crore to Rs 24 crore in the year under review.

Polyester filament yarn is primarily used to produce synthetic fibre which is a substitute for natural fibre and when blended with natural fibre gives almost the same comfort and at a cheaper cost. Century Enka is one of the most established players in this industry. CEL operates on the batch processing system and manufactures polyester yarn from the chips stage. Due to the batch processing system and longer production runs, costs are higher compared to the other companies in the industry.

CEL derives 62 per cent of its revenue from PFY and about 30 per cent from nylon tyre cord and nylon filament yarn. With the increase in caprolactum prices, a major raw material for nylon tyre cord and nylon filament yarn, margins were under pressure. Further with a capacity of 31,400 tpa of PFY, the company did not enjoy economies of scale as the capacity was underutilised.

An expansion plan costing Rs 500 crore is on the cards, with schemes to increase the output of polyester filament yarn (PFY) and synthetic industrial yarn/tyre cord. One of the foremost industrial filament yarn manufacturers in the country, Century Enka has undertaken expansion of its polyester filament yarn plant at Mahad worth Rs 150 crore. The expanded capacity is expected to go on stream in the second half of 1996. The uncertainty in the availability of cotton at reasonable prices was the reason behind the expansion.

The company is hopeful of improving performance in the coming year because of the upturn in the automobile sector which has led to increased demand for tyres. This will increase the offtake of tyre yarn and tyre cord fabrics. The government's decision to abolish tariffs on polyester yarn has led to the shutting down of the company's in-house twisting and dyeing operations for texturised polyester yarn. The tariff is binding only on units whose operations are integrated in nature and independent twisters and dyers are exempt from the duty. With the abolition of tariff values for POY and texturised yarn, excise is payable on the selling price at 57.50 per cent *ad valorem*. Thus only POY and texturised yarn producers pay excise on POY and texturised yarn while those having integrated plants will be eligible to pay excise duty on higher price realised for twisted or dyed yarn. The government's move, it is feared, will retard the growth of the industry. Units in the industry will have to bear an additional levy ranging from Rs 5,000 to as high as Rs 23,000 per tonne on twisted and dyed polyester yarn at a time when the polyester yarn market is passing through a bad patch.

The company has promoted Rajashri Polyfil (RPL) to manufacture partially-oriented yarn which can be further processed to make texturised yarn (POY). RPL is setting up a 66,600 tpa plant at a cost of Rs 504 crore with facilities to manufacture 28,700 tonnes of PET chips and 37,900 tonnes of partially oriented yarn (POY). The company has 19 per cent equity participation in Centek Chemicals with Century Textiles and Industries and Akzo N V of the Netherlands holding 16 per cent and 40 per cent, respectively. Centek Chemicals has set up a plant to manufacture polymerisation initiators which are used for manufacture of polyvinyl chloride, low density polyethylene, polysterene, acrylic polymers, etc. The major users of these products are petrochemicals industries and the optical lens manufacturers. The plant was commissioned in July 1992 in Mahad in Maharashtra at a capital outlay of Rs 12.10 crore. Net sales were Rs 13.92 crore, higher than the projected estimate of Rs 10.60 crore. Net profit also surpassed the projections of Rs 2.70 crore and reached Rs 3.60 crore. The performance is attributed to improvement in technology that has come about as a result of constant effort at cost reduction.

OUTSTANDING BOOKS

WOMEN PRIME MINISTERS IN SOUTH ASIA
S. Shafan
Throws light on the Settings in which the women reached the top governmental positions & attempts to find out their leadership style & their impact upon their Political sysems.
1995 **ISBN 81-7169-335-0** **Rs 275.**

TOWARDS GENDER EQUALITY
K. K. Verma, Rajan Verma & Saboohi Kazim
Provides a fascinating evaluation of the efforts made towards achieving gender equality through Organising media Campaigns in some of the villages of Bihar and evaluates the media efficacy in the context of socio-cultural matrices.
1995 **ISBN 81-7169-334-2** **Rs 275.**

The annual inflation rate rose for the second successive week to 8.51 per cent in the week ended August 12. Net RBI credit to the centre has gone up again and the rise in the current fiscal year was Rs 18,479 crore on August 4 compared to Rs 1,037 crore in the same period of 1994-95. There was adequate liquidity in the system and call rates ruled easy in August. In primary floatations, yields on 91-day TBs have declined from 12.71 per cent to 12.58 per cent, while those on 364-day TBs came down significantly from 13.16 per cent to 12.87 per cent. Forward premium on the dollar has declined further and rarely did it cross the 5 per cent per annum mark in August. The havala rate, which had dipped below Rs 35 in July, continued in the Rs 34.70-Rs 34.80 range.

COMMENTARY

NEW DELHI

Using Planning Commission as a Political Pawn

BM

The prime minister's attempt to bring the Planning Commission back to life by calling a meeting of the Commission was part of his desperate efforts to win back lost popular support through populist gestures, but it backfired with the severe indictment of the economic reform programme in the Commission's mid-term appraisal of the Eighth Plan causing further embarrassment to the government.

THE prime minister found it expedient to pull in the Planning Commission from limbo after a whole year and convene a meeting on July 19. This was done as part of his feverish preparations for the coming elections to the Lok Sabha which are posing a threat to his survival in office. The move, like many other similarly inspired ones, however, boomaranged on him.

The proposed meeting of the full Planning Commission was not to be followed up by a session of the National Development Council. Nor was any serious review of the Eighth Plan performance intended. The National Development Council – headed by the prime minister and composed of chief ministers, some union cabinet ministers, including the finance minister, and full members of the Planning Commission – was set up to promote a national consensus on and provide political sanctions and administrative support to planning socio-economic development. Its importance has been enhanced now when a majority of the state governments are led by parties other than the Congress ruling at the centre. But Narasimha Rao did not want to associate the NDC with his latest 'planning' caper which was designed to serve his exclusive electoral purposes. He wanted to drag the Planning Commission into giving some respectability to his pre-election populist gestures and announcements.

Earlier a sub-committee of NDC had been set up. This was publicised as an initiative to associate state chief ministers with the planning process. The sub-committee had drawn up reports on some important policy matters, among them one on 'austerity' to improve government finances and boost national saving for investment. These reports were simply shelved by the Rao government. Rao was interested only in securing the endorsement of the Planning Commission for his 'special schemes' of employment generation when some members of the Commission showed concern for the policy conditions required to improve opportunities for gainful and productive employment which has begun shrink at a fast rate in the wake of the economic reforms, especially the open door policy towards foreign investment. Rao was not interested in these forebodings. The Planning Commission members were also concerned about the large shortfalls in the Eighth Plan's growth and poverty alleviation targets. All these matters surfaced sharply when the meeting of the full Planning Commission fixed for July 19 was postponed without much ado by the prime minister.

The prime minister has, however, found himself in an awkward position after the cancellation of the meeting of the Planning Commission. He belatedly realised shortly before the meeting was to take place that the Commission had finalised a mid-term appraisal of the Eighth Plan which had recorded sharply the lags and shortfalls in the implementation of the Eighth Plan. Aside from the lackadaisical functioning of the prime minister and his office, which the abrupt cancellation of the meeting of the Planning Commission has further emphasised, the episode has also exposed the total disregard of the Rao-led government for the Eighth Plan's commitments and targets. This obviously does not mean that the competence of the planners in Yojana Bhavan to draw up a development plan and monitor its implementation is under question, as is being suggested in some interested quarters, especially in the PMO. What is in question is the ability and readiness of the political and administrative set-up headed by Rao to implement the plan. In fact the professional members of the Planning Commission in Yojana Bhavan can claim that their planning exercises have become more detailed, meticulous and in-depth over the years. It is the Rao government which has made their labours infructuous. In the past also the planners have had problems because of the lack of appropriate policy and administrative decisions by the political leadership. However, what they have now to reckon with is that the very philosophy and rationality of planning had become irrelevant to the Rao government which has opted for a crude and infantile variety of *laissez-faire*. This is what its so-called economic reform programme is really all about.

The balance of payments crisis of 1991 is only the ostensible reason for launching the structural adjustment programme. The economic liberalisation and globalisation policy in fact means that planned investment and mobilisation of domestic resources, which have shrunk to dangerously low levels, are no longer among the government's concerns. Private enterprise is to be relied upon for economic growth. If the members of the Planning Commission still managed to write the Eighth Plan in such conditions and have now come out with a mid-term appraisal of the plan, they deserve credit for playing a useful role in an adverse political environment. The Planning Commission was reconstituted by the Rao government after the finance ministry had been made the pliant instrument to propagate and implement the readymade policy blueprints provided by the international financial institutions on behalf of India's foreign creditors to make the Indian economy abjectly subservient to and open for exploitation by foreign capital and a handful of its Indian collaborators among businessmen, professionals and politicians. The claim sometimes made on behalf of the government that development planning is still relevant is, therefore, misleading and cynical. The structural adjustment programme is geared to market forces to determine investment and production priorities. It puts private, especially foreign, corporate business on a pedestal and decisively rejects any role for the government as the agency for development, except as a sideline activity for the personal gain of bureaucrats and politicians.

The very idea of planning on the basis of social, economic and political-strategic priorities for strengthening the autonomy of India's development process and consolidating the country's political independence is condemned by those who call the shots. Ideas of social transformation, decentralisation of the political and administrative structures, protection of labour-intensive productive activity and assurance of gainful employment have ceased to have any relevance to the government's economic and social policies. The Eighth Plan noted "a declining trend in employment elasticity with respect to growth in GDP". This trend, instead of being halted, has now been confirmed in the mid-term appraisal to have accelerated as a result of the hi-tech, labour displacing economic growth which has been zealously pursued during the plan period. The idea that foreign trade and the services sector would generate employment on a massive scale – a target of 10 million jobs had been set in the plan – was clearly a fanciful one. The domestic saving rate

had turned stagnant "partly influenced by the larger availability of consumer goods", as the Eighth Plan document had pointed out, which was a shamefaced way of acknowledging the surge of consumerism among the upper classes, encouraged by fiscal and investment policies. The position in this respect has worsened under the "reform" policies and further eroded resources for development of the economy and people's welfare.

When Eighth Plan was being formulated it had been proclaimed by the government that under the scheme of structural adjustment of the economy, the primary role of public authority in the development process would be to promote the social infrastructural sectors such as health, education and family planning. The planners had shown more foresight and honesty in noting in the plan document that, in Indian conditions, responsibility for investment in the development of the material infrastructure, which is long gestating and gives low returns but widens opportunities for high profitability for private enterprise in the economy as a whole, would still rest in large measure on public authority and that private enterprise would take up this responsibility in response only to special incentives. Even for carrying out the tasks set for the public sector in the scheme of the Eighth Plan, therefore, the government would be required to raise resources on a massive scale. This position has now become stark and has been sharply presented in the mid-term appraisal of the plan. But any worthwhile corrective is precluded by the fiscal, pricing, production and trading policies pursued under the structural adjustment programme.

It was, therefore, a grand deception on the part of the Rao government to talk of reduction in poverty, increase of employment, vast expansion of the social infrastructure of education, health and family welfare when the Eighth Plan was drawn up. Under the new economic policy dispensation, the plan projections were entirely fanciful. The assumptions with regard to an inflation rate of between 6 and 9 per cent, a current account deficit no more than 1.8 per cent of GDP, a decline in the government's dissaving rate and an export growth rate of 13.6 per cent annually in the Eighth Plan could not possibly have materialised. The mid-term appraisal of the Eighth Plan is unquestionably a useful document insofar as it has underlined this situation, much to the discomfiture of the Rao government. With the planning hoax of the Rao government thus exposed, the government has landed itself in an embarrassing position in the pre-election year. It is treating the mid-term appraisal as 'confidential' in a desperate attempt to protect its economic policy pretensions. The mid-term appraisal has shown that the so-called reforms have failed miserably to promote either economic growth or social equity. The argument is being peddled that the performance of the government, indeed the achievements of its reforms, should not be judged in terms of the targets of the Eighth Plan. The 'positive' trends in the economy after the crisis year of 1991 when reforms were launched are being loudly stressed. The fact is being side-tracked that the Eighth Plan was finalised in 1992 and took into account the sorry state of the economy in 1991. The mid-term appraisal notes developments in the reform era in terms of various economic indicators – growth rate, poverty alleviation, current trade account and saving rate – and compares them with the position in the second half of the 1980s. The first three years of the so-called post-reform period show a sharp retrogression on all counts

With the step-by-step removal of the constraints on the free play of market forces and the pull of effective demand in the economy, investment flows, production structure and income distribution cannot conform to any meaningful and equitable socio-economic priorities. The attempt to obfuscate this truth cannot carry credibility. The leading forces at work in the socio-economic structure and the political-power superstructure with which the prime minister has identified himself have clearly no use for planning. The functioning of the Rao government in the last four years has clearly testified to this position. If the Rao government still maintained the charade of planning and kept the Planning Commission in place, it was the wily politician's way of fooling public opinion, especially since the results of the so-called liberalisation policy were bound to provoke strong popular protest. But, meanwhile, the ruling party, basking in the applause of the small affluent segment of the population and of foreign vested interests, has lost its mass support base. There is no way to retrieve the lost electoral-political support through empty populist gestures in the pre-election year. The attempt to activate the Planning Commission behind such an attempt too has misfired.

It is not surprising that as a concomitant of the economic deterioration in the wake of the scuttling of planning and the launching of the economic reforms, the much cheered political stability during the tenure of Narasimha Rao as prime minister has been found to be a surface phenomenon. The self-styled economic reformers and their publicists are embarrassed by the developments in the economic, social and political spheres. Matters have indeed come to a head for the prime minister's party, in fact for all political parties and personalities. Rao proclaimed at the Surajkund conclave of his partymen that he did not propose any more to join the forthcoming electoral battle on policy issues. The fight, on his part, would be for "who occupies the chair". The wild populist gestures and promises he is making are, therefore, designed explicitly to buy votes by hook and crook. What are being proposed are frankly doles. The estimates of expenditure on these doles which are being trotted out do not guarantee that such expenditure will be actually undertaken, let alone reach the selected beneficiaries. The leakages to officials and/or non-government agents and agencies of the ruling party, which will be associated with their implementation, are known to be large even in normal times. They will be exceptionally large in the pre-election year. The Rao government's tenure in office is coming to a close as five wasted years for the country in every way and on all counts.

CALL FOR PAPERS

Unpublished papers, in the nature of an encyclopaedic contribution, are invited for inclusion in a multi-volume series being edited by Professor S. Bhagwan Dahiya on **Liberalisation, Globalisation and Adjustment Programmes: Theory and Practice**. The scope of this work includes the following aspects:

1. The role of Economic, Social and Political forces in driving and shaping globalisation and regionalisation, and their interaction.
2. The relationship between globalisation and regionalisation.
3. The implications of globalisation and regionalisation for developing countries.
4. The economic, social and political dimensions of liberalisation, globalisation and adjustment programme.
5. The process of interactions between interest groups and government decision-making during the successive phases of adjustment.

LAST DATE FOR SUBMISSION OF MANUSCRIPTS, PREFERABLY ON FLOPPY DISK: 30 NOVEMBER 1995

This series will be published by the **Spell Bound Publications Pvt. Ltd.**, Rohtak

Papers should be sent to:

Professor S. Bhagwan Dahiya
F-2, University Campus
Rohtak-124 001 [INDIA]

Fourth World Conference on Women

'Gendering' Development: Issues and Politics

Shobha Raghuram
Ruth Manorama

Women the world over are concerned that Beijing should not remain only as a meeting point in the history of women's struggles enhanced by the characteristic celebratory space, but also be the time for genuine and committed negotiations when governments will set in motion policies and actions which will secure the advancement of women as equal social and political citizens of their communities and nations.

OVER 30,000 women are expected to be in China for the UN Fourth World Conference on Women (September 4-15, 1995), and its parallel Non-Government Organisation (NGO) Forum (August 30-September 8, 1995). At the Chinese capital, government delegations will complete the final round of negotiations on the Platform for Action, the document which in its draft form has already undergone several rounds of negotiations, the most crucial one being at the 39th Commission on the Status of Women (CSW), in NY (March 15-April 4). While the not-so-long-ago World Summit for Social Development at Copenhagen focused on issues of poverty, unemployment and social integration, the Beijing Conference has as leitmotifs the themes of equality, peace and development. The agendas for equality include goals for equitable and sustainable development, demands for safeguarding women's human rights throughout their life cycles and commitments from governments to that end, and, also the agenda for upholding peace as an irreducible condition for development. When governments at Beijing adopt the Platform for Action and commit themselves to implementing the agendas, they will be doing so at an important juncture in history.

It is 50 years since the dark skies of Hiroshima and Nagasaki and we are on the eve of the 50th anniversary of the founding of the United Nations. We are two years near to 50 years of the idependence of India and we are 50 years after the great historical beginnings of the Quit India Movement. The crises in human governance continue to mark the politics of everyday living and they are reflected in survival indicators. Poverty continues to be progressive, undermining the full potential of various advancements in human endeavour and new forms of violence continue to be invented and executed. Chernobyl and Bhopal remain searing landmarks of large-scale human disasters. The prospects for the poor everywhere and women in particular are bleak, despite the great histories of social struggles and resistances. And the world remains as divided as ever. Africa contains 27 of the 41 countries with the lowest per capita income and the rest belong to Asia. Ever mounting debt, increased drug trafficking, lowering of environment standards as more polluting industries get relocated in the south, and an overall worsening of work conditions as large-scale migrations take place have all been serious setbacks for the efforts of governments and peoples' organisations during the last three decades to secure human rights in an economic, political, cultural and social justice agenda. Development efforts have not been able to resolve the dual realities of plenty and famine, health and disease, unparalleled advancements in knowledge and technology and growing illiteracy with child labour for many. The Social Summit concluded with issues being raised with concern and with no real commitments being made. Women the world over are concerned that Beijing should not remain only as a meeting point in the history of women's struggles enhanced by the characteristic celebratory space but also be the time for genuine and committed negotiations when governments will set into motion policies and actions which will secure the advancement of women as equal social and political citizens of their communities and nations.

For women, 'one half of the sky' and earth, much is at stake. They remain the prime architects and actors in preventing whole communities from collapsing. They remain the authors of a palpable struggle against the dehumanising trends of globalisation, of private accumulation and of untold violence against the poor, the disadvantaged, women and children. Women globally have struggled and will continue at Beijing to refuse to be treated as 'soft policy options', as beneficiaries, as appendix to documents, or as supplicants for some benefits. They have underscored at the earlier negotiating grounds their strong and uncompromising roles as:

> Full and equal participation in all spheres of public and private life, based on full economic, social and political citizenship...

They have asserted that social rights and entitlements are part of constitutional obligations.

Platform for Action

The Platform for Action is a lengthy document running to 121 pages including the proposed Beijing Declaration which accompanies the Draft Platform for Action. It comprises three sections: the Statement of Mission, the Global Framework, the second section outlining the critical areas of concern, strategic objectives and actions, and the last section devoted to institutional mechanisms and financial arrangements for promoting the advancement of women. This document succeeds the Forward Looking Strategies (FLS) Document agreed upon at the Third World Conference on Women in Nairobi in 1985. The proposed Beijing Declaration which precedes the DPOA contains a preamble that expresses concern about the situation of women and emphasises the need to act. On the goals

(a) the previous international instruments are reiterated,
(b) the global environment (descriptive) outlining world changes and the consequent changes for women is stated and
(c) so is the enabling environment (prescriptive) of empowering women and mainstreaming women in development

The Draft Declaration ends with calling for 'high-level' commitment towards implementation of the POA and the action required at the national and international level. The Statement of Mission and the Global Framework lays out the intent and the vision that inspire the women's movement. It also significantly underscores the macro frameworks in which women will have to fight for their equality. Key references include "accelerating the removal of obstacles to women's full and equal participation in all spheres of public and private life, based on full economic, social and political citizenship.... State policies were often indecisive and compromises were made in institutional and financial agreements, leaving many gaps in implementation. In the absence of mechanisms which could enforce accountability, it was difficult to hold institutions or the government responsible, the trend continued in favour of gender equality and violations and women's rights. Other factors were economic development trends and the concentration of power related to global fiscal restructuring. This has permitted governments to sacrifice the quality of life and fundamental rights of the people, particularly women".

The 12 critical areas of concern include:

(a) The persistent and increasing burden of poverty on women.
(b) Unequal access to and inadequate educational opportunities.
(c) The equalities in access to health and related services.
(d) Violence against women.
(e) Advance peace, promote conflict

resolution and reduce the impact of armed or other conflicts on women.

(f) Inequality in women's access to and participation in the definition of economic structures and policies and the productive process itself.

(g) Inequality between men and women in the sharing of power and decision-making at all levels.

(h) Insufficient mechanisms at all levels promote the advancement of women.

(i) [Lack of awareness of and commitment to [internationally and nationally recognised] human rights of women. [The enjoyment of all universal human rights by women]*.

(j) Inequality in women's access to and participation in all communications systems, especially the media; and their insufficient mobilisation to promote women's contribution to society

(k) [Lack of adequate recognition and support for women's contribution to managing natural resources and safeguarding the environment]*.

(l) [Persistent discrimination against and violation of the rights of the girl child]* [Survival, protection and development of the girl child]*.

Contested Areas

Each of the areas of concern carries with it a set of strategic objectives and actions. The sections on Poverty, Health, Economic Inequality, Human Rights, Environment and Girl Child have proved so far to be the most controversial areas of contestation. The European Union, the G-77, the Holy See (Vatican) and the US have been playing strong roles in influencing the document and gaining competitive advantage. Women from developing countries have challenged the already accepted presupposition evident particularly in the sections on Poverty and Economy Inequality. The strategic objectives and actions for *Poverty* are:

- Review, adopt and maintain macro-economic policies and development strategies that address the needs and efforts of women to overcome poverty within the framework of sustainable development.
- Revise laws and administrative practices to recognise women's rights to economic resources and to ensure women's access to economic resources.
- Provide women with access to savings mechanisms and institutions and to credit.
- Conduct research in order to enable women to overcome poverty.

And for *Economic Inequality* they are:

- Promote women's self-reliance including access to employment, appropriate working conditions and control over economic resources, land, capital, credit, technology and guarantee economic opportunities for women - Secure economic rights for women.
- Take positive action to facilitate women's equal access to resources, employment, markets and trade.
- Provide business services and access to markets, information and technology to low-income women.
- Strengthen women's economic capacity and commercial networks.
- Eliminate occupational segregation and all forms of employment discrimination.
- Create a flexible work environment - Better harmonisation of work and family responsibilities for women and men.

Both the areas accept the present global fiscal restructuring and assume that women must now find ways and means of mitigating the impact of liberalisation and find within civil society structures that will guarantee their 'minimum' conditions of survival. Women have condemned first, the ascendance of the market ideology which have promoted inequities and second, the unsustainable economic growth in industrialised regions which have jeopardised the quality of women's lives. While the European Union at the Commission on the Status of Women argued that "we need to underscore the positive impact of the structural adjustment policies on women" activists, economists and many members of the G-77 agreed that the negative aspects deserve emphasis. The demands in these two areas of concern for action include:

(1) The SAP must be reviewed. The impact of national and international programmes on women should be monitored. Gender disaggregated data should be made available.

(2) The reform of the multilateral landing bodies must be put back on the agenda. The transparency and accountability of the Bretton Woods institutions is high on the list of demands made to all governments and UN bodies

(3) Economic policies should be directed towards achieving sustainable development in the long run and not short-term economic growth.

(4) The implications of the new trade regime and the World Trade Organisation should be examined and information made available. The increasing roles for women in the service sectors and 'free trade zones' call attention to issues of hazards, work conditions, minimum wages, social securities and human dignity.

(5) Women from south countries and India in particular have demanded an international regulatory mechanism for all Transnational Corporations. This becomes urgent considering that the Centre for Transnational Corporations was closed down and the WTO opened. Within the UN structure, there must be a body that continuously monitors the impact of transnational corporations on women. This can be situated in the Economic and Social Council.

(6) Counting women's unwaged work needs the evolution of a global structure of work including unpaid work. Recognising and quantifying women's unremunerated work and including its value in the Gross Domestic Product (GDP) or a satellite account of the GDP emerged as a key issue. Women do two-thirds of the world's work, receive only 5 per cent of the income, own less than 1 per cent of the assets. Women remain at the bottom of the hierarchy of work and wealth. This is aggravated by the subtle and devastating problem of racism. "It shapes every aspect of women's reality, ranging from the impact of SAP on women in the south to lack of pay equality for women north and south, and determines how their lives are spent. Yet this reality is nowhere reflected in the GDP." This was pointed out by Juan Somania (Chile), Chair, World Summit on Social Development.

(7) Actions by governments require a constant social and gender audit so that the poor and women as a whole would not be burdened with victimhood. Women urged for all development projects to be transparent, accessible from the initial stages to institutions in civil societies so that there would be a reduction of the oft-heard story, 'the unintended consequences'.

(8) Low income countries should receive compensation for losses experienced as a result of GATT. Resources should be made available for social development.

(9) Debt reduction that go beyond existing packages must be reviewed. Debt cancellation as demanded at Copenhagen has to be renewed.

(10) Governments of developed countries must commit at least .7 per cent of the GDP to development assistance. Governments of developing countries need to provide information regarding the utilisation of aid women insist on accountable and transparent structures for aid utilisation and urge their governments to implement aid in a manner which does not erode the self-reliance of nations and their people.

(11) Women and food securities is a sectoral issue which will continue to receive sustained attention from all major women's organisations. The decline of investments in agriculture by the state especially in developing countries, coupled with slashing down public food subsidies has been a matter of growing concern to women globally. Women's organisations are mounting pressure on governments to play a decisively affirmative role in this regard and warning multilateral lending institutions to remove conditionalities which cripple the survival of the poor. Women's organisations at Beijing in the NGO forum will share models on how people in communities have developed their own foodgrain banks, etc.

We have looked at the DPOA and even a generous view does not dissuade us from believing that in the final analysis it fails to provide in essence the history of patriarchy and nation states and their continued influence in women not having rights over land and property. The document neither takes a hard look at the inherited social

* Bracketed and under negotiation as of May 15, 1995.

systems nor does it wish to challenge the global political economy which absorbs and reinvents the dominant structures in third world countries. Women's economic exploitation and the oppression and violence that ensues, according to the DPOA, requires only cosmetic and accommodative spaces of redressal in dominant, gender insensitive modes of economic transaction common to the command market driven economies.

The sector of health will continue to be a space of severe contestation. While south countries have insisted on strengthening peoples' access and affordability of health care (focus being on basic health care needs), the Vatican will insist as it has done at the CSW meeting to bring back the controversy on abortion which dogged the ICPD agenda This has been a tedious process and women's organisations from both south and some north countries have had to work overtime to project the problems of health care of poor women be it in area of basic and comprehensive health care services, human reproductive technologies or drug policies which do not cut off health care from being available to the poor 'Women's health in women's hands' will be a sister slogan to 'Health for all'

Human Rights Framework

Governments have also been asked to ratify the six core Human Rights Treaties. Women activists and several governments have demanded the use of the Human Rights Framework in the core areas of reproductive, economic, social and legal rights. The three existing UN Treaties which need to be recalled include the International Covenant on Economic, Social and Cultural Rights (1966), the International Covenant on Civil and Political Rights (1965) and the Convention on the Political Rights of Women (1953). In 1945 the UN Charter declared the principle of equal rights for all "without distinction as to race, sex, language or religion". Throughout the negotiations women have reminded governments that there is *no going back* on the hard won achievements of the earlier UN conferences. The World Summit for Children (1990), UNCED (1992) which recognised the skills and knowledge of rural and indigenous women, the protection of the environment and the management of resources, The World Conference on Human Rights (1993), ICPD (1994) which reaffirmed women's reproductive rights as human rights and the World Summit on Social Development (1995) which called attention to the pivotal role of women in addressing the problems of poverty, unemployment and social integration. At the same time one needs to be reminded of how long drawn the processes in the UN system are, leave alone how effective the UN is in enforcing nation states to abide by the treaties they ratify. In 1946 the Commission on the Status of Women was established by the UN Economic and Social Council. It took many years of work, from 1959 when the Convention on the Political Rights of Women took place, to 1981 when CEDAW came into force, for women to realise how painstaking and convoluted is the process of achieving rights for women among all the UN member states. While in 1985 at Nairobi the FLS for the Advancement of Women to the year 2000 was drafted and voted on, it was only in 1990 that the Commission on the Status of Women began work on reviewing progress towards implementation of the Nairobi FLS. In 1994 several regional preparatory processes for the Fourth Women's Conference took place especially in Indonesia, Argentina, Jordan and Senegal. In 1993 at the World Conference on Human Rights a Special Rapporteur on Violence Against Women was appointed and a preliminary draft of report was submitted at the CSW this spring Women from everywhere, at the CSW meeting reinvoked the ICPD achievements in underscoring the empowerment and autonomy of women as the basis for development and the Copenhagen Social Summit 1995 call for attention to the pivotal role of women in addressing the problems of poverty, unemployment, and social integration At the CSW NGO women insisted that Beijing must not only adopt and determine priority actions but also get down to mobilising women and men at both the policy-making and grass roots levels. Women have called for a restructuring of the UN system with much greater transparency and accountability. Women want a UN that offers and ensures global securities to civilians by way of strong institutional relations with member states. The UN continues in the post-cold war era and the post-year 2000 to hold out a few possibilities in this direction particularly towards providing governance in an unequal world, torn by armed and ethnic conflicts Women will also be asserting at Beijing that a primary component of comprehensive peace will be an acknowledgement that the security of all people is more important than the security of states They have called for a total elimination of all nuclear, chemical and biological weapons and a ban on arms trade. They will be calling for the UN to recover the original aims for which the UN was created and for the UN to reassert its original purpose: Being the most viable mechanism for guaranteeing peace and governance. It is no simple coincidence that the bracketed texts continue to be references to SAP, governance of multilateral lending institutions, TNCs, social and gender audit of all major development environmental projects, ban on arms trade, among others!

In the last one-and-a-half years during which time women the world over have been having regional meetings, negotiating with governments, etc, this question has been raised: 'Whose world is it and who will speak for whose world?' If nation states wish to continue with their existing geo-political rivalries and contentions, Beijing must not be the site for these longstanding rivalries. It is a tragic irony that the oppressed in whose name meetings are being held and vast amounts of money is being spent, should hardly matter or figure as central to the negotiations and discussions. If UN conferences are reduced to peer group meetings where governments will be present and united on making no commitments to the people under review, these meetings may as well be done away with. In the process of globalisation, women as agricultural workers, as construction labourers, as peasant women, as community workers, and as industrial workers in free trade zones, among others, are fighting to safeguard their resources, keep their communities and families from disintegrating as the global economic integration takes place. Women from south countries are quite clear in taking the stand that integration for the command economies and the elites everywhere could mean further social disintegration, increased migration, increasing number of female-headed households and even harsher working conditions for the poor everywhere.

Critical Juncture

We are at a critical juncture. Women the world over face the rightwing back clash. In the name of the 'family', for example in the US, the women's movement is being held responsible for the 'break up' of the family. Women everywhere need to assert their protest against all fundamentalism which destroy the broader social fabric on which alliances are built The pro-poor climate is certainly on the demise and neither the states nor the markets will assume responsibilities for the sacrifices and the social costs borne by the working classes, women and children in the informal sector, dalits, tribals, in effect all those who have the greatest moral and political rights for demanding the fruits of development and economic growth. What is the status of the Beijing Declaration and the Platform for Action? Will a moral agreement on a specific set of values, an open and agreed commitment to the set of values, objectives, and strategies for action *bind* governments to 'gendering' development and with political will create institutional mechanisms that work for the social good? While governments at Beijing will meet and decide on the final Platform for Action, women representatives both at Beijing and in their home communities will continue to insist on a minimum agenda of: Right to employment, regularisation of employment, minimum wages, maternity and paternity leave, right to association and collective bargaining, right to dignity, provision for safe and secure work environment, equal political representation at all levels, right to education, provision of constitutional guarantees and enactment of legislation to prohibit discrimination on the basis of sex and guaranteeing of full human rights to women throughout their life cycles, among others.

Uniform Civil Code

Implications of Supreme Court Intervention

S P Sathe

Different ethnic, religious and linguistic groups have different traditions and cultures and they are entitled to preserve them. Their personal laws are based on these traditions and cultures and therefore cannot be obliterated just for the sake of uniformity. A uniform law will have to accommodate such ritualistic diversities.

IN a recent case (*Sarla Mudgal*) where a Hindu had converted himself to Islam in order to marry a second wife while the first was living, the Supreme Court was provoked to ask the union government what it had done in pursuance of the directive principle of state policy contained in article 44 of the Constitution, which enjoins upon it to take steps for providing a uniform civil code. This has triggered a debate on this subject again. While uniform civil code as an ideal is doubtless laudable, the timing and the occasion for the Supreme Court's intervention was not opportune. Further, the speeches which the judges have made are likely to be misunderstood and could send wrong signals to various quarters. They could strengthen the majoritarian chauvinism on the one hand and minority fundamentalism on the other.

In fact uniform civil code, like the cause of Hindi as a national language has suffered due to overenthusiastic espousal by its crusaders. The minorities, including the Muslims might have been less resistant to modernisation of their personal laws, if the kind of arguments which are often made by its supporters had been avoided. Some such arguments were unfortunately aired out by the learned judges of the Supreme Court and this further complicated this issue.

One of the judges Justice Kuldip Singh said that a uniform civil code would strengthen national integration and that the minorities should give up their commitment to the two nation theory and agree to a uniform civil code. It was further said that the Hindus had accepted reforms in their personal laws and sacrificed for the national unity. The learned judge therefore exhorted the state to take steps to provide a uniform civil code. Now that the Supreme Court has observed that the above observations were not binding and were merely *obiter dicta*, they need to be carefully examined because even the obiters of the Supreme Court are worthy of greatest respect.

We already have uniform laws in matters other than family affairs such as marriage, divorce, maintenance, inheritance and adoption. The assumption that uniformity produces harmony and integration itself needs to be questioned. We have one law for the majority community and yet can we say that there is integration within it? There are disputes between the 'savarnas' and the 'dalits' and between various linguistic groups. Did peoples of Karnataka and Tamil Nadu not kill each other recently when they quarrelled over the waters of the River Cauvery? Such dissent does not disappear by the presence of a common law. Democracy admits dissent and since ours is a plural society any effort to regiment various ethnic and linguistic groups into a uniform mould could be counterproductive. Identity must be distinguished from separatism. Having distinct identities is not against national integration and they do not necessarily lead to separatism. Different ethnic, religious and linguistic groups have different traditions and cultures and they are entitled to preserve them. Their personal laws are based on such variety of traditions and cultures and therefore cannot be obliterated just for the sake of uniformity.

One does not necessarily subscribe to the two nation theory or multiple nation theory by insisting upon the preservation of the status quo. Within one nation there can exist a number of legal systems. In fact federal government means the coexistence of such multiple legal systems. Our Constitution places the plenary legislative power in respect of family, inheritance, adoption, etc, in the Concurrent List of the Seventh Schedule thereby implying that both the centre as well as the states can make laws on these subjects. This means that Maharashtra may have its own family law different from that of Karnataka. In the US, each state has its own matrimonial law.

Those who oppose changes in the personal laws are not necessarily anti-national, though we may call them status quoists and conservative. If you read the report of the Hindu Law Reform Committee chaired by B N Rau, you will see that various objections to the reform of the Hindu Law had been raised by leading members of the majority community and some of those objections were similar to those which the minority leaders raise today. Even Rajendra Prasad, who was the president of India was not favourably disposed towards the proposed reforms of the Hindu Law. Reform of the personal laws which is a precondition for the emergence of a uniform civil code gets delayed if one buttresses the case for it with such emotive arguments.

The Constitution doubtless visualises the emergence of a uniform civil code but does it mean a single law for all? Can we not have different laws for different communities provided they are based on uniform principles of gender and social justice?

Article 44 of the Constitution which contains one of the directive principles of state policy needs to be interpreted in consonance with the spirit of the Constitution. What the directive principle of state policy means is that there should be uniform laws but not necessarily a common law. The expressions 'uniform' and 'common' are often used interchangeably but they have different connotations. Extension of the majority community's law to all the minorities would doubtless make for a common law but would it make a uniform law? The word 'uniform' in article 44 means that all communities must be governed by uniform principles of gender justice and human justice. Each personal law therefore needs to be critiqued from the perspective of social and gender justice. It will mean the modernisation and humanisation of each personal law. A uniform law would mean not necessarily a common law but different personal laws based on uniform principles of equality of sexes and liberty of the individual. Let there be reform of each personal law so as to weed out gender injustice and outmoded traditions or practices. Article 44 of the Constitution must be interpreted in conjunction with article 14 of the Constitution which guarantees equality before the law and equal protection of the law. Article 14 allows classification of the people and traditions, cultures and even religion in conjunction with either or both of them could be the basis of classification. This was the essence of the decision given by the Bombay High Court in *Narasu Appa Mali*'s case in which two of India's most versatile judges namely, Chief Justice Chagla and Justice Gajendragadkar (who later became the chief justice of India) upheld the Bombay Prevention of Bigamous Marriages Act, 1946 on the ground that the prohibition of polygamy among Hindus was not a different treatment to the Hindus on the ground of religion but was because of the different traditions, history of social reform and cultures. Certainly there can be no discrimination on the ground of caste or sex and therefore such traditions which place women in subordinate position will have to be disregarded. Revision of the personal laws from such standpoint will ultimately take us towards a uniform civil code. Such uniformity can sustain the diversity of the laws. Uniform civil code should not be construed as a mandate for regimentation of

the laws because such regimentation smacks of totalitarianism

The central government, however, cannot be absolved from the charge of having neglected the welfare of the minority communities. On the one hand it took no steps to modernise and reform the law of marriage and divorce pertaining to the Christians in spite of several requests from that community. The Law Commission made a study of that law and gave its report (80th Report, 1980) and the Supreme Court as well as several high courts have exhorted the government for its inaction (*Shah Bano, Mary Roy* and *Swapna Ghosh* See Sathe 1991)

On the other hand it nullified whatever had been achieved through judicial process towards the mitigation of the gender injustice in the Muslim Personal Law through decisions such as *Shah Bano*. In that case, the Supreme Court held that a Muslim divorcee was entitled to maintenance under section 125 of the Code of Criminal Procedure from her husband even after the period of 'iddat' The passing of the Muslim Women's Right on Divorce Act, 1986 was the most regressive legislative intervention which boosted the morale of the Muslim fundamentalists and orphaned the Muslim divorcees

We feel happy that the union government is now taking up the reform of the Christian Matrimonial Law. This could be the beginning of the process of modernisation of the personal laws. The government should follow this up by a law of adoption for all the communities. Such a law is necessary because at present the facility of adoption is not open to the minority communities. Under the Hindu Adoption Law, only a Hindu can adopt and only a Hindu child, either born as a Hindu or brought up as a Hindu can be adopted.

Legislation for the Muslims cannot be indefinitely postponed. The argument that personal law is immune from the intervention of the sovereign legislature is not sustainable. The right to be governed by personal law was never considered as part of the right to freedom of religion guaranteed by article 25 of the Constitution. Moreover, freedom of religion guaranteed by article 25 of the Constitution is subject to "other provisions of this Part" which means it is subject to the provisions contained in Part III which contain guarantees of the fundamental rights. Even if freedom of religion comprehends the right to be governed by personal law, it does not cover the right to perpetuate denial of equality or personal liberty to a section of people who are governed by such personal law. Reform of the personal law would be for making these laws consistent with the fundamental rights of the women folk and would also be a measure of social welfare for which the state can legislate under sub cl (b) of cl (2) of article 25. Polygamy, unilateral divorce, absence of provision for maintenance for a divorcee are some of the curses which deserve to be weeded out.

The Indian Secular Society has published a draft Indian Marriage and Divorce Act prepared by the scholars of the ILS Law College, Pune. Another draft on the law of inheritance and succession is in the offing. A draft of the common law of adoption has also been prepared by some organisations. The draft on Marriage Law published by the Indian Secular Society is flexible enough to accommodate the diversities of traditions and culture prevailing among various communities in a uniform law. These drafts are intended to serve the purpose of providing a basis for a meaningful debate on the subject which will be free from acrimonious or chauvinistic overtones.

While making these drafts we realised how difficult it would be to arrive at a common law. Our draft therefore had to accommodate diversities that exist in the personal laws. For example, the rules regarding the prohibited degrees of relationship are different in the Muslim Personal Law from those in the Hindu Law. A Muslim can marry his first cousin or should a Hindu be permitted to marry a first cousin whereas such a marriage is totally forbidden for the Hindus. Should a Muslim be prohibited from marrying the first cousin or should a Hindu be permitted to marry a first cousin? Why should we really do that? Is it not better to allow each of these communities to follow their own traditions? A debate would take place on whether a person's right to dispose of his property by will should be restricted as is done under the Muslim law. It would be fiercely opposed by Hindus, Christians and Parsis who would say that such a restriction would go against individual liberty. The Muslim law provision on the other hand would doubtless ensure gender justice because daughters are often denied their inheritance by the willing away of the property.

Each community would like to enjoy its freedom regarding religious rites performed on a wedding. The insistence of the secularists that religion must be banished from all worldly affairs may be ideologically sound but practically not wise. Even the mighty Soviet Union did not succeed in banishing religion. The uniform law will have to accommodate such ritualistic diversities.

What is important is that the process of taking steps towards a uniform civil code should begin. So far this matter has suffered either from total neglect of the governments or aggressive postures of the majoritarian elements.

Kashmir: Autonomy Only Solution

Asghar Ali Engineer

Only steps towards autonomy backed by credible guarantees will provide a long-lasting solution to the problem in Kashmir.

THE Kashmir problem has caused so much bloodshed, yet there is no solution in sight. Punjab and Assam also saw long drawn struggles but now there is not much violence in these two states, although it is difficult to say that they are devoid of any problem. But in Kashmir violence still rages. Most of the Kashmiris I met claim that more than 40,000 people have died. The Charar-e-Shariet incident has further complicated the issue. Thus, the uppermost question is what could be done to resolve this tangle?

There is no doubt that the people of Kashmir have begun to realise that the gun is not the solution to their problem. When the movement began in 1989 it was thought that 'azadi' was round the corner. The whole atmosphere in the valley was tense due to the abduction of the then home minister Mufti Mohammad Sayeed's daughter. But such heroics lead nowhere. The Kashmiri militants have killed, beside innocent people, many of their own ranks – Qazi Nisar, Maulvi Farouque, and several others.

This is not to overlook, let alone condone, state violence. In fact, it is state violence which legitimises militancy in the eyes of the oppressed people. The day I reached Kashmir there was a general strike because the security forces had shot dead two engineers on mere suspicion. No one dared to say anything before the paramilitary forces. A truck driver was mercilessly beaten by the paramilitary forces before my eyes. Such acts further alienate the people. So long as army and paramilitary forces remain in the valley there is bound to be widespread violation of human rights. It is almost impossible for any government to stop it. In the case of Kashmir, it is all the more difficult as ISI of Pakistan is also playing its own game. The Jamaat-e-Islami-controlled 'Hizb-ul-Mujahidin' and the ISI-controlled 'Harakat-ul-Ansar' have vested interests in keeping the valley in turmoil. The state of turmoil ensures continuous flow of arms and money.

In the initial stages, militants came from middle class intelligentsia. They were committed to make sacrifices for 'azadi'. Some of them took to the gun thinking it to be the only way to achieve their goal. Some militants also came from the lowest rungs of society who envied their upper class masters. Many domestic servants also took to the gun and could dictate to their former employers. There have been cases where they tried to marry daughters of their former employers at gun-point. But soon lumpen and criminal elements took over the militant leadership. Some of them were drug-peddlers. Today it has become difficult to ascertain as to who is fighting for 'azadi' and who for their own or Pakistani ends. But one thing is clear. The people of Kashmir have begun to realise that militancy has led them nowhere, it has only ruined them. They have also realised that Pakistan cannot liberate them whatever its proclamations. It only aims to create turmoil in the valley for its own ends. Thus a peaceful solution which ensures dignity and honour to the people of Kashmir is being sought.

Here too there is no unanimity among the Kashmiris. Though the Indian government has lost its credibility in their eyes, all parties do not reject accession of Kashmir with India. Only the Hurriyat leaders and the militants challenge it. The National Conference, the Janata Dal, the CPI(M) and other groups in Kashmir do not want to reopen the issue of accession at all. All of them agree to a measure of autonomy to Kashmir. Even the governor thinks that without autonomy elections will not be effective in Kashmir.

For Pakistan

I interviewed almost the entire cross-section of Kashmiri society and their views ranged from "our legitimate accession could only be with Pakistan" to "Pakistan has ruined Kashmir". According to Lone, a member of People's League which is also part of the Hurriyat, atrocities by the army and the paramilitary forces have not stopped. They have committed more atrocities in villages than in Srinagar. He cited example of Mohammed Khan from Uri who was cut to pieces when he intervened on behalf of some villagers who were being beaten by the security forces. He admitted that the problem was extremely complicated and cannot be solved through guns. He was ready for negotiation and for reducing the defence expenditure of the two countries so as to keep south Asia free from the nuclear race. Lone did not lay down any conditions for starting negotiations.

Gilani of Jamaat-e-Islami (the main constituent of the Hurriyat) which controls Hizb-ul-Mujahidin maintained that India should declare Kashmir a disputed territory and fulfil its commitment to hold a plebiscite. "We can negotiate with India only on that basis. There is no question of accepting autonomy. We have sacrificed lives of more than 40,000 people and honour of our women for what? For autonomy? Certainly not. We will accept nothing less than plebiscite", was his refrain. On being asked whether he will demand independence for Kashmir, he replied that according to the UN resolution only two options are available: accession to India or Pakistan; there is no third option. When asked how does he expect 60 per cent of Hindus of Jammu and large number of Buddhists of Ladakh to join Pakistan, he pointed out that when Hyderabad and Junagadh were annexed through police action, the Muslim populations in those states had to remain in India, similarly, Hindus and Buddhists from Jammu and Ladakh can join Pakistan. On being informed that Muslims in Hyderabad and Junagadh states were not more than 7 to 8 per cent, he did not reply. Gilani was of the opinion that the Kashmiri pandits should return to the valley, though he cannot guarantee their safety when their own lives were threatened.

In Sopur shops were closed because security men on patrol duty had looted a few shops. The security forces had taken revenge since a grenade was thrown at them. Many people complained that their houses were forcibly occupied by the security forces. Sopur is a stronghold of Jamaat-e-Islami and Hizb-ul-Mujahidin and was at one time considered to be a 'liberated area'. For security personnel it is a hyper-sensitive zone. There are military bunkers all around and many houses are converted to military camps.

Abdul Ghani of Muslim Conference who resides in Sopur maintains that Kashmir belongs to Pakistan and if a plebiscite takes place he will vote for Pakistan. According to him the Kashmiris have been fighting for their rights since 1931 and took to the gun as a last resort. They know that gun cannot solve the problem but as in Ireland and in Sri Lanka it can lead to the negotiating table. Gani wanted the problem to be solved through the combined efforts of India, Pakistan and the people of Kashmir. He agreed that Jammu and Ladakh are not for merger with Pakistan. He wanted Chenab to be accepted as the dividing line, a proposition rejected even by the UN. Gani informed that there are 800,000 security forces in the valley but he had not given up hope and would not be subdued by the gun.

Muzaffar, a retired college principal in Sopur, has no trust in Indian government and finds Indian secularism a sham after the demolition of Babri masjid. An advocate from Sopur frankly admitted that though he is for Pakistan, the people of Kashmir are not for it. They prefer 'azadi'. He also admitted that armed struggle had ruined the economy of the valley but felt that had India fulfilled its commitments to Kashmir sincerely and invested in its development, disaster could have been averted.

In Baramula, a sensitive border town with a large Sikh population, a merchant considered both India and Pakistan responsible for their plight. He felt that mere

elections cannot solve the problem unless the basic issue is addressed. People may be forced to vote by the army but the government will not inspire confidence. The only solution according to him was autonomy and better economic opportunities for the youth.

For Autonomy

Farouq Abdullah, the ex-chief minister of Kashmir, was despondent and bitter that Narasimha Rao had not promptly responded to the Kashmir situation. For him the accession of Jammu and Kashmir to India was not subject of debate. But he wanted the 1952 accord between Nehru and Sheikh Abdullah to be honestly implemented to make elections meaningful. Abdullah also said that if autonomy is duly granted and elections are held, Kashmiri pandits will be able to safely return to the valley and this will enhance the prestige of the Congress in the country and enable it to win the general elections. But the Rao government is dithering. Further, any declaration of autonomy must be fortified with credible guarantees. The people of Kashmir have been repeatedly betrayed and the Indian government needs to act quickly and decisively to salvage the situation.

Peer Ghyasuddin, an ex-Congress minister and now a Janata Dal member, recently published a book on Kashmir. According to him, the Jamaat-e-Islami with its links with ISI is mainly responsible for provoking militancy in Kashmir. It was Mir Qasim who made an alliance with the Jamaat in early 1970s and strengthened it. The Jamaat took advantage and inducted its men into key positions. It also appointed hundreds of teachers from amongst its supporters and thus could get an opportunity to brainwash the students with its pro-Pakistan ideology. The Jamaat could influence a section of Kashmiri intelligentsia also. Ghyasuddin alleged that a large number of drug-peddlers are supporters of the Jamaat. Most of the militants are urban lumpen while some militants come from poor rural background. He did not hold the Indian government responsible for Charar-e-Sharief incident and viewed substantial autonomy as the long-lasting solution.

Zafar Iqbal, a noted journalist of *Chattan*, an Urdu weekly, found both the sides adamant. The Indian government by its insensitive dealings had deeply alienated Kashmiris. Yet people are equally disillusioned with Pakistan. They would prefer 'azadi' but it is not forthcoming.

The Janata Dal president of Jammu and Kashmir unit, Abdul Qayyum Ansari and M Yusuf Tarigami of CPI(M) blamed the Jamaat-e-Islami for ruining Kashmiri people. Kashmiri people are liberal and follow Sufi Islam. When the Jamaat did not succeed in spreading its influence among the masses, it inflicted militancy on them. If autonomy is promised peace can be negotiated. Both were of the opinion that even if army had not burnt Charar-e-Shariel it cannot wash off its responsibility for the incident.

Shabbir Shah spent more than 20 years of his life in Indian jails and yet is not bitter about it. His only demand is that let people of Kashmir decide their future. When he met Vajpayee at New Delhi, he told him that since the latter had improved India-Pakistan relations why is he ignoring the aspirations of the Kashmiri people by opposing article 370. Shabbir Shah also clarified that he stands for all Kashmiris. Kashmiri pundits are an integral part of Kashmir and it was Jagmohan, the then governor, who created a fear psychosis in their minds. Pandits were killed not because they were Hindus and pro-India but because they were part of the establishment against which Kashmiris are fighting. The Indian government wants to use them as pawns in their power game. When Kashmiri leaders complain about violations of human rights, Indian government tells the world what the militants have done to Kashmiri pandits. Most of the pandits have been given jobs and only poor pandits suffer in miserable camps, said Shabbir Shah Shabbir Shah squarely blamed the army for the destruction of Charar-e-Sharief. The people of Charar-e-Sharief have defence ordnance shells in their possession "How could Mast Gul possess such shells, if it is he who burnt it?", was his question.

Krishna Rao, the governor of Jammu and Kashmir, in an hour-long discussion gave the entire background of the Kashmir problem. He admitted that the Kashmiris have genuine grievances Elections were rigged in the past and there has been widespread corruption. Though the situation has improved still there are corrupt officials, some of them given to wine and women. This erodes the government's credibility Krishna Rao claimed that though the security forces have committed excesses, they have been considerably disciplined.

He did not agree that 40,000 people have been killed. He puts the figure as 10,000, with militants and civilians in equal number Out of 30,000 militants arrested 27,000 have been released, he informed. The governor is for holding free and fair elections. L K Advani wants to conduct elections only after militancy in the state is completely uprooted. But, Rao argued militancy can be better fought with the help of a popular government.

According to Rao, the army was not involved in the burning of Charar-e-Shariel. He informs that the shells with defence ordnance markings were launched to illuminate the darkness so that the army could spot the enemy in the night. Nevertheless, many Kashmiris believe otherwise. Something effective needs to be done to restore the government's credibility. Judicial inquiry should not be avoided, if the army has not played any role in burning down the Charar-e-Sharief.

The governor said that unemployment led the youth to join the ranks of militants. Therefore, he asked for 10,000 jobs to be created for the Kashmiri youth in various parts of India. "Can we not create 10,000 jobs in a big country like India?", he asked.

Conclusions

The overall conclusions reached after the visit to Kashmir can now be mentioned. Firstly, there is widespread feeling of alienation in the valley. The valley looks like a vast military camp. Secondly, the people of Kashmir are now looking for a credible solution. They feel they have been ruined by militancy. Thirdly, as pointed out by almost all, autonomy is the acceptable solution. Only a section of the Hurriyat might reject it. Announcement of autonomy might result in a division in the ranks of Hurriyat. Fourthly, autonomy should be announced before the elections are held and should be backed by credible guarantees. The people of Kashmir feel that they have been repeatedly betrayed and mere announcements may not satisfy them. Fifthly, various developmental schemes must be started with a sense of urgency and officers of proven integrity should be put in charge of these schemes. Lastly, the common people of Kashmir are, despite years of militancy, liberal and tolerant as they ever were. Many of them feel Indian secularism can provide a better alternative. But they are dismayed by the rise of Hindu fundamentalism

New Banking Culture and Small Borrower

N A Mujumdar

The new banking culture nurtured by the economic reforms is alienating not only the small borrower but also the small saver.

THE reforms in the banking sector, introduced since mid-1991 initially as part of the macro-economic adjustment programme, have changed the profile of Indian banking, particularly of public sector banks. No longer, is it now possible to camouflage inefficiencies of banking under the garb of 'social banking'. Profitability has emerged as the single-most important criterion for judging the operational efficiency of individual banks. As the Reserve Bank of India (RBI) put it: "Improving the profitability of banks would have to be a major pre-occupation..." Recapitalisation of nationalised banks, introduction of a system of income recognition, asset classification and provisioning, a greater degree of autonomy to banks in the interest rate regime, reduction in the non-performing assets (NPAs), and in the Statutory Liquidity Ratio (SLR) – all these have changed the face of public sector banks. RBI deserves to be congratulated for transforming the profile of Indian banking in such a short span and so painlessly.

While all this is well documented and recognised, there is an aspect of change, which is in a way a by-product of reforms, but which has remained virtually unnoticed. The reference here is to what might be called 'the new banking culture' which has emerged. This brief article seeks to focus on the new culture because it has far-reaching implications for the future growth of the economy.

Most public sector banks today are attempting to cast themselves in the image of foreign banks and in the process there is a conscious neglect of priority sectors. Banks are there to cater to multinationals and the corporate elite and per chance to deal in derivatives – the lesson from Leeson is yet to be learnt! Let the small and tiny sector enterprises, the self-employed, the technocrat entrepreneur fend for themselves: they can approach the finance companies or the moneylender. Thus the new banking culture nurtured by reforms is reflected in shunning lending to priority sectors, exploiting fully opportunities offered by capital market-related activities, a nose for making an easy and quick 'kill' in terms of profits, making use of finance companies in preference to direct lending. This new culture is epitomised in the statement of the chairman of the State Bank of India who spoke of the "demise of traditional banking" in India. This approach betrays an innocence of Indian economic realities as we would seek to show.

The main theme of this article is to demonstrate that this new mind-set emerging among public sector bankers would be disastrous for the future growth of the economy, unless RBI takes concrete measures to make the new banking scenario compatible with small borrowers.

Let us begin with the positive impact that reforms have produced on public sector banks. Even the Narasimham Committee, no admirer of public sector banking, did recognise that during the last two decades or so since the nationalisation of banks in 1969, public sector banks have supported broad-based growth, mobilised larger resources, integrated the rural population into the financial mainstream and provided increased access to small industries, small farmers and weaker sections of the society. In terms of sustainability of viability, however, the system left much to be desired. Basically, the capital base – the ratio of paid up capital and reserves to deposits – of public sector banks was around 2.85 per cent in 1990-91. This was very low by international standards. The ratio of non-performing assets to total assets of the banking sector as a whole was as high as 22 per cent. Lack of proper disclosure norms had facilitated the process of pushing the problems under the carpet. The net profits of public sector banks after provisions and contingencies were no more than 0.18 per cent of working funds. All this has now changed. Indian banks with branches abroad were required to achieve a 'risk weighted' capital adequacy ratio of 8 per cent by the end of March 1995, while all other banks are required to comply with the 8 per cent norm by the end of March 1996. Out of 27 public sector banks, seven banks have achieved the 8 per cent norm and nine banks the 4 per cent norm as at the end of March 1994. Regarding the NPAs, for the system as a whole, NPAs are estimated to have declined from around 24 per cent in March 1994 to a little less than 20 per cent in March 1995. By the end of March 1995 all banks have fully met with the new provisioning requirements. Finally, the number of public sector banks showing operating profits has gone up from 19 to 21 in 1993-94. Although six banks continued to show operating losses, RBI's projections indicate that by March 1995 at least two of these would have begun to show operating profits. This turn-around is a tribute to the remarkable skill with which RBI has achieved the transformation.

Neglect of Priority Sectors

Let us now turn to the other side of the coin. The most conspicuous feature of the 'new culture' bred by reforms is the wilful neglect of priority sectors. The share of priority sectors in total net bank credit declined consistently from 40.9 per cent in June 1991 to 39.3 per cent in June 1992 and further to 35.9 per cent in June 1993. There are two disturbing aspects of the default. First, although the target for priority sectors remained unchanged at 40 per cent, RBI appears to have chosen to wink at the default. Not only is there any traditional exhortation by RBI to banks to fulfil the target, but RBI has maintained a studied silence on the default. The RBI's *Annual Report 1993-94* was content by merely presenting the data on sectoral deployment of credit; there was not even a routine mention of the default. The *Report on Trend and Progress of Banking in India 1993-94* goes only a step further: "As a share of net bank credit it (priority sector credit) increased by 1.9 percentage points from 35.9 per cent in June 1993 to 37.8 per cent in March 1994, against the stipulated target of 40 per cent". RBI's reports enjoy, and rightly so, a very high reputation for their analytical skills. Why is it then that this persisting and significant decline in the share of priority sector credit escaped RBI's attention? One cannot blame commercial banks if they interpreted RBI's studied indifference as a signal for condoning their wilful default. In sharp contrast to RBI's approach, the *Economic Survey, 1994-95* of the government of India provides a detailed discussion on this trend in priority sector credit. The explanation offered here may be an apology for an explanation but what commands admiration is its transparency. The second disturbing aspect of default is that such a decline in the share of priority sector has occurred in spite of the fact that the 'norms' of priority sector credit have been diluted substantially. For instance, direct and indirect advances to agriculture can now be clubbed for meeting the sub-target of 18 per cent of direct advances to agriculture. The definition of priority sector itself is widened: advances up to Rs 5 lakh for financing the distribution of inputs for agriculture and 'allied' sectors can now be considered as indirect advances to agriculture. The 'allied' activities include dairy, poultry and piggery and consequently advances for poultry feed and cattle feed are eligible for being included under this category. The decline in the share of priority sector therefore becomes all the more conspicuous and RBI's indifference inexcusable.

As the recent MS Shoes episode has demonstrated, the nose for an 'easy kill' had goaded banks to rush into areas where angels fear to tread. Both private and public sector banks were involved in such adventures: the disease is so contagious that even small banks the headquarters of which are situated away from the metropolitan centres were involved. It is high time that we realise that what may apparently appear good for the balance sheet of an individual bank may not be necessarily good for the growth of the economy.

Fortunately, RBI has acted quickly in this area. Two measures deserve to be specifically mentioned in this context. There has been a proliferation of finance companies during the last couple of years; and also an unduly large increase in credit from banks to such companies. Apart from the business of equipment leasing, hire purchase, car finance, etc, there is the apprehension that they lend, directly or indirectly, to support the capital market. It was in this context that RBI banned in September 1994 commercial banks and financial institutions granting bridge loans or interim finance to non-banking financial companies (NBFCs) against capital/debenture issues, etc. RBI reiterated in April 1995 that this ban should be strictly observed and that banks/financial institutions should ensure that this is not circumvented by provision of credit under different nomenclature such as temporary/short-term loan or working capital assistance. In addition, the overall limits of borrowings by NBFCs from banks/financial institutions have been reduced. RBI has also advised development banks to moderate their lending to NBFCs.

There is another dimension to such lending. Although bridge loans to finance companies are banned under the present guidelines, banks and financial institutions can together extend bridge loans to companies against public issues and/or borrowing from the market up to a maximum of 75 per cent of the amount actually called up on each occasion. From April 17, 1995 such bridge loans by banks/financial institutions to all companies including finance companies have been banned.

These measures taken by RBI have to be seen in the broader context of the unsavoury developments in the capital market, which have surfaced in more recent months. The unwary saver should not be taken for a ride by fly-by-night operators.

Anti-Poverty Image

If the reforms in the economy in the post-1991 phase have come to acquire an anti-poverty image, the financial sector reforms are also to be blamed for it. RBI went about systematically draining out the 'social content' from the banking system. Three measures can be mentioned to substantiate this point. First, concessionality in the interest rate structure, which was the bedrock of the interest rate regime, was virtually abolished. Even a small borrower today has to pay an interest rate of 12.5 per cent as against 10 per cent or so earlier. Secondly, provisioning has become essential even for small loans: banks are now required to provide an ad hoc 7.5 per cent on all advances below Rs 25,000. As a consequence, banks have become increasingly reluctant to lend to small borrowers. The decline in priority sector lending has already been discussed. The third point relates to resources of the National Bank for Agriculture and Rural Development (NABARD). It may be recalled that RBI used to contribute to the National Rural Credit Long Term Operations (LTO) Fund; this fund used to provide on a continuing basis resources of a sizeable magnitude at nominal cost to NABARD, which in turn was able to offer refinance facilities to banks and co-operatives at attractive rates of interest. RBI in its new-found market mythology, withdrew its support to NABARD from 1992-93 and hence the latter's ability to inject funds at concessional rates of interest in the rural sector has been eroded seriously. No wonder that capital formation in the rural sector has declined sharply.

In fairness it must be added that the RBI occasionally makes appropriate nosies on a social banking. For instance, C Rangarajan, governor, stated in January 1995: "Banks and financial institutions are legitimate instruments of social and economic change. Even as banks expand their activities to meet the diverse credit requirements attention must be paid to those sectors which may have special needs. Good banking should not be inconsistent with socially concerned banking". But the pity is none of the credit policy measures introduced in the post-1991 phase reflects this good intention! Ultimately, it was left to the finance minister to reinject the 'social content' into the banking system and restore the role of banks as catalyst of development.

In the Budget proposals announced by the finance minister in March 1995, two major programmes designed to promote broad-based growth and enlarge employment and income-earning opportunities for the weaker segments of the society were proposed: the establishment of a new Rural Infrastructural Development Fund (RIDF) and funding of the Khadi and Village Industries Commission (KVIC). What is interesting from the point of view of the theme of this article is that commercial banks are involved in both of these schemes. Banks which default in meeting the priority sector sub-target of 18 per cent of net credit to agriculture would be required to make the deficiency good by contributing to RIDF. This stipulation is likely to create a corpus of about Rs 2,000 crore for RIDF. Again, banks are also required to provide on a consortium basis Rs 1,000 crore to the Khadi and Village Industries Commission (KVIC) which will on-lend these funds to khadi and village industries enterprises, either directly or indirectly.

This raises a more fundamental question: Are we not promoting what can be called 'banking by proxy'? By surrendering some Rs 2,000 crore to NABARD and another Rs 1,000 crore to KVIC, are not banks running away from their legitimate responsibilities. In fact these schemes would be tantamount to saying 'If you cannot meet your priority sector targets surrender the amount to NABARD'. It is understandable why such an option is provided to foreign banks which suffer from certain infirmities like lack of a branch network, so far as lending to priority sector is concerned. But why equate domestic, particularly public sector, banks with foreign banks? In fact, commercial banks have a much better track record in the area of direct lending to small borrowers than either NABARD or KVIC. There is always an advantage in involving banks directly in implementing, supervising and monitoring the concerned projects.

In the urban sector, banks are finding it increasingly convenient to lend in bulk to NBFCs, as mentioned above. The small-scale industries, micro-business and other small borrowers are in fact being pushed into the arms of the NBFCs which charge lending rates of 25 per cent or even more. One begins to wonder whether we are reverting to the pre-nationalisation era when banks used to lend to 'multanis' or moneylenders, who were perhaps the only source of finance for small borrowers, they were charging usurious rates of interest. Are we elevating NBFCs to the status of the 'new multanis'? In a way this is the logical corollary of imitating textbook patterns of banking in a developed economy: transaction costs are lower if you lend to a small number of large borrowers, rather than if you lend to a large number of small borrowers.

Public sector banks have begun recently to imitate foreign banks in insisting upon a large minimum balance to be maintained by savings bank account holders: this is yet another fall-out of the market mythology. This is a retrograde step in a system where public sector banks could take legitimate pride in helping to raise India's saving rate to a respectable level, through the process of institutionalisation of household sector's savings.

This new banking culture thus alienates not only the small borrower but also the small saver!

Macro-economic compulsions demand that during the next 10 years or so there should take place an employment explosion, if a significant dent on poverty is to be made. Going by empirical experience the organised sector is incapable of providing the needed thrust to bring about such a massive expansion in employment. One has therefore to look to the informal sector – non-farm subsector, rural industries, small, tiny and service subsectors, market-related self-employment programmes, and so on. In fact, this is one way of looking at the decentralised and broad-based growth pattern envisaged in the Eighth Plan. If the banking system has to play the role of a catalyst of development, a new regime of credit delivery system has to be forged, perhaps involving voluntary organisations (NGOs) and self-help groups. A whole range of advisory services would have to be provided especially if the new hi-tech areas are to be fully exploited. Viewed against this macro-economic perspective, it is imperative that our banking system, particularly public sector banks should refocus their attention on lending to priority sectors, small borrowers, micro-enterprises in the hi-tech areas and so on.

WEST BENGAL

Warning to Left Front

Biren Roy

The CPI(M)'s attempt to take the offensive by organising a 'victory rally' notwithstanding the results of the Calcutta civic election, like those of the earlier municipal elections throughout the state, have been a setback for the party.

THE results of the Calcutta civic polls held on July 9 clearly reveal erosion of the influence of the CPI(M) and the Left Front in the city proper and adjoining areas. This was the third election held on the basis of the 1980 Municipal Act which has some unique features. It provides more power for the elected representatives. A cabinet type of constitution has been adopted with the provision of mayor-in-council led by the mayor vested with substantial executive powers.

In this election, out of 141 seats the Left Front got 70, the Congress(I) 66, BJP 2 and independents 3. Out of 3 independents, two have later on joined the Congress and one is still undecided. But in the 1990 election, the Left Front had secured 99 seats and the Congress(I) had won only 37 seats and the BJP 2. The CPI(M) alone had secured 71 seats, i e, a majority of the 141 wards. But this time, the CPI(M) secured 53 seats and other Left Front partners 17 seats, including three independents supported by the Front. In Calcutta proper consisting of 100 wards, the CPI(M) secured 34 seats, other Left Front partners 14, including one independent, whereas the Congress(I) secured 50 seats, having wrested 17 seats from the Left Front whereas the Left Front wrested only one seat from the Congress(I). The BJP won 2 seats in Calcutta proper. In Jadavpur area (adjacent to Calcutta), which is a traditional stronghold of the Left Front, that is of the CPI(M), it could maintain its influence by securing 13 out of 14 seats losing only one by a narrow margin, but in Behala, another stronghold of the CPI(M), it lost heavily; the Congress(I) secured 12 out of 18 seats. In the Garden Reach area predominantly inhabited by industrial workers and a Muslim minority, the CPI(M) won four out of nine seats. Here, an independent of dubious character defeated both the Congress(I) nominee and the Left Front candidate who was a CPI stalwart. The CPI's performance was dismal, it won only four seats out of 15 contested by it. An important feature of this year's election was that one-third of the total 141 seats, that is 47 seats, were reserved for women. The Left Front won a majority of these seats. The Congress(I)'s gain was spectacular despite in-fighting between the official PCC(I) and the Youth Congress(I) led by Mamata Banerjee, MP. The results demonstrated a negative vote for the Congress(I). Both the Congress(I) and the CPI(M) accused each other of resorting to unfair means in the election. But there is no doubt that the election this year was largely free and fair compared to the last election of 1990.

Different reports indicate that in many constituencies the Muslim minority and slumdwellers did not vote for Left Front candidates. This is an ominous sign.

In civic elections, besides national politics local issues also play an important part. On the whole Calcutta citizen's expectations from the mayor-in-council were not fulfilled. On top of all these, the high-handed behaviour of a section of CPI(M) activists and their alleged link with corruption made voters hostile to it. Being in power in the state for a long period of 18 years, there is no doubt that a section of CPI(M) cadres has become corrupt and self-seekers. There are allegations that factionalism inside the local CPI(M) have led to the defeat of the CPI(M) candidates in certain areas.

In its election campaign the CPI(M) failed to raise any significant slogan for improvement of civic services, except highlighting the 'megacity' project and industrialisation with high technology. The result showed that the citizens did not attach much importance to these slogans. On the other hand, the Congress(I) harped on corruption and partisanship of the administration. One has to appreciate that present-day youth, especially those between the ages 18 and 25 (the voting age has been lowered to 18 years), have no experience of the misdeeds of the Congress regime during the 1970s, but they experience the misdeeds of a section of the CPI(M) activists in their respective localities. This factor influences their decision.

The Congress(I) fared well also in the municipal elections held about a month ago in different municipalities. A significant aspect was that the CPI(M) lost in the industrial belts of Hooghly district and in Kharagpur, another industrial area, and also in certain semi-urban areas bordering the urban municipality. These areas were considered so long to be bastions of the CPI(M). There is no doubt that the result of the recently concluded Calcutta civic elections and other civic elections definitely shows a setback for the CPI(M). After the results were announced, there was jubilation in the Congress(I) camp and despondency in CPI(M) circles. But the CPI(M) sought to take the offensive by organising a victory rally on July 15.

It should be mentioned that Jyoti Basu, the most popular leader of the CPI(M) was absent during the whole period of civic elections. He was busy wooing the MNCs in the US and the UK. It is clear that his activities abroad did not enthuse the voters.

As the Congress(I) decided not to contest the mayoral post and in fact boycotted the election, a CPI(M) mayor was re-elected unopposed. The mayor-in-council has also been formed, though there is some bickering among the Left Front partners over allotment of portfolios in the mayor-in-council.

Prospects of improvement of civic services are not very bright especially in the face of Congress(I) resorting to obstructive tactics.

The CPI(M) will do well to self-critically analyse the causes of the setback in Calcutta and other civic elections and take corrective steps against degradations in a section of the party. It should publicly declare the shortcomings observed through such analyses.

NEW BOOK FROM **MD** PUBLISHERS OF THE HUMANITIES NATURAL & SOCIAL SCIENCE

FORESTRY RESEARCH IN TROPICAL ASIA-PACIFIC

By

S S. Negi

1995, 228p, bib, index, 22x14 cm

ISBN 81-85880-80-8 Rs 300 00

This book provides a brief account of forestry research in the countries of Tropical Asia-Pacific It also incorporates discussions on issues in Forestry, Deforestation, Constraints for Forestry Research and Forestry Research Management.

New Malaria Action Plan

Panic Response

Sunil Kaul

The 1994-95 malaria epidemics in many parts of the country were undoubtedly a result of the breakdown of the administrative aspects of the National Malaria Control Programme. Yet, the new plan of action adopted recently introduces new technical features without tackling the administrative problems.

THE modifications made in 1995 to the National Malaria Control Programme's (NMCP) Modified Plan of Operations (MPO) and thus named Modified Action Programme have been clearly made in a hurry as a panic reaction to the large-scale deaths that took place in various parts of the country in the past one year. The diagnosis of the epidemic has been wrong; the remedy seems to be worse.

While the blame for the epidemic should be placed squarely on the medical administrative machinery, most of the changes that have been made are directed at the technical aspects of the programme while the administrative aspects of the plan have seen only cosmetic changes. Public health tenets have been shown the back door under the guise of a pragmatic approach to tackling malaria. On the one hand, there are important changes made in treatment schedules without assigning cogent reasons for the shift in policy; on the other hand, *status quo ante* is maintained about pill sizes and availability of syrups/sugar coated formulations of chloroquine for small children. What is really inexplicable is the silence on the issue of making humanpower and material resources available for the implementation of various modifications without which the plan may not work at all. To begin with MPO says that "Deaths due to malaria are only due to P falciparum infection" (para 3.2.1). This is too sweeping a statement and denies the victims of relapsing P vivax, like those who have severe anaemia and either abort or succumb to childbirth, a sensitivity that they deserve despite their low incidence. Further the presumptive treatment for areas where microscopic diagnosis is not available immediately is laid out to be chloroquine plus sulpha combination because "suplha combination has no action o P vivax". This fact that sulpha combination is ineffective against P vivax is not borne out by any of the standard textbooks of pharmacology and if there is some study available to the NMEP which proves this, it needs to be brought out of the wraps.

The action plan shows a table which indicates the radical treatment of P vivax, P malariae, and mixed infections, according to which an adult will have to take four tablets of 150 mg chloroquine and six of 2.5 mg primaquine on the first day and continue taking six tablets of primaquine for the next four days. The dosage for radical treatment of P vivax as per the WHO schedule still continues to be 10 tablets of chloroquine over three days and had been the same in the NMEP guidelines earlier The technical committee which has recommended a lower dosage must have done so only after having convinced itself of the efficacy of such a truncated dose by some studies which are contrary to the experience of many a doctor like myself working in the field. Obviously, we need to know more about such a study. Besides, the thought of swallowing 10 tablets at one go has always been very worrisome for most patients one encounters. NMEP could do well by making two different types of tablets of chloroquine which can be scored to make it easier to halve 600 mg and 300 mg tablets can do the trick for all ages and cases of malaria Similarly, 5 mg and 10 mg scored tablets of primaquine can do the needful for all ages and cases requiring the drug. This can reduce the maximum number of tablets at one time to only two and a half

Further on the action plan mentions 600 mg of chloroquine as sufficient for the radical treatment of P falciparum. This is once again questionable on the same grounds as earlier but needs double the attention because inadequate dosage schedules can worsen the chloroquine resistance situation already getting out of hand in the country. The higher chloroquine dosages (menioned in 3.2.3 (c)) which conform to the WHO schedules are recommended 'wherever feasible' but this falls short of what malaria conscious doctors would like others to prescribe

Also, there is no rationale of prescribing primaquine to patients with the P falciparum parasite because there is no persistent tissue phase to tackle. If it is given to prevent transmission, it can be justified as a public health measure only during epidemics because of its attendant risks of causing haemolytic anaemia. To expose all the patients at all times to the risks of this drug when it is of no benefit to the patient cannot be explained except in extreme circumstances.

Similarly, the treatment schedule for radical treatment of resistant strains of P falciparum for adults has been limited to 1,000 mg Sulfalene + Pyrimethamine although there should be some provision for 1500 mg Sulfalene + 75 mg Pyrimethamine for adults as per WHO recommendation (at least for those weighing more than 50 kg).

Earlier in the action plan document the conditions mentioned for identification of high risk areas in rural areas has no relation to the ABER, and thus there is every possibility of the surveillance going awry. The low ABER which has been the hallmark of our poorly supervised malaria programme can never provide reliable data for any programme. Hence formulae can easily be worked out to take into account the ABER of the particular PHC to avoid a situation where the monitoring may become meaningless on account of low ABER.

The voluntary link worker (VLW) which has been advocated by the scheme (para 3.1.3) may be in line with the latest thinking of involving the local community in tackling malaria, but it should be reserved only for areas other than high risk areas. Laying out the duties of VLW does not mean an ensured accountability for surveillance of a standard that is desirable for areas at a high risk. Further, there must be some provision for incentives (per slide collected) or honorarium payable probably by the panchayat to ensure continuity of the VLW.

With reference to pathological examinations only the JSB stain has been recommended for examining blood smears. This is frequently out of stock NMEP should have taken this opportunity to include the possibility of using Leishman's stain which can be used equally well to see the malarial parasite and is easily available for routine blood examinations. One has frequently seen malarial surveillance work stopping on account of non-availability of the JSB stain and the manual in its present form only reinforces the assumption that malaria smears can only be seen using the JSB stain. Further, the expectation that a lab technician can examine 100 fields in five minutes is too far-fetched especially because there are no assistants provided to the lab technicians.

Prevention

The malaria engineer (mentioned in para 4.1.3) needs to be described further because one has not heard of such a speciality in the engineering field. Maybe, NMEP is committed to run such a course. On the selection of suitable insecticide the manual fails to mention anopheles stephenis, one of the major urban vectors and the one responsibile for the epidemic of Rajasthan in 1994. The decision not to entrust the

insecticidal spray operations to "non-technical personnel like contractors, voluntary bodies, etc", is objectonable because voluntary bodies are in close contact with the village communities and this is the easiest of the antimalarial operations in which the villagers can contribute. Also, till the NMEP manages to get a large workforce, the spraying of the remote areas will continue to suffer.

Further, the report mentions that "Cattle sheds are not to be sprayed" in order to divert the mosquitoes from human dwellings to cattle sheds. This point was actually stressed upon earlier but in the reverse, in that cattle sheds were not to be left out. To reverse its earlier stance, the NMEP is now localising its sights only on human malaria. This may be understandable, but it losses sight of the fact that the most vulnerable population – that is women of childbearing age – enters these sheds precisely at the times of maximum activity of mosquitoes, that is, at dawn and dusk, and will get exposed to the mosquitoes, unless this directive is changed. What one is also sure of is a general resistance in the villages to such a selective spraying because animal sheds are associated with the mosquito menace.

The recommendation to monitor the cholinesterase levels regularly appears very ambitious because such facilities are not available anywhere in India except a select handful of cities. Mass surveys as advocated in the report must be avoided as they tend to encroach upon the busy schedule of the lab technician and adversely affect the slide examination rate.

Apart from the points highlighted above, there are many issues included in the manual either a bit prematurely, e g, biocide sprays which are as yet unavailable with the NMEP, or need to have been stressed upon but have only a slight reference, e g, the use of lavicidal fish for the control of malaria. One would have hoped for this facility to be made available at the PHC level but the manual does not recommend this. There is also a silence on the peripheral monitoring of insecticide rsistance of mosquitoes and of chloroquine resistance amongst plasmodium (one of the forms in the life cycle of the micro-organism). The earlier this is ensured so as to allow a prompt and decentralised action to be taken at the PHC level to encounter the resistance, the better it would be.

One more field where the NMEP can help is to encourage the use of mosquito net and other personal protective measures. In times of epidemics, serious thought can also be given to chemoprophylaxis for all the people or at least for children and pregnant women. Last but not the least there is a crying need to ensure that the system works. None of the plans will come to fruition unless there is accountability in the system. Random and surprise checks of prescriptions to see if they conform to rational or NMEP guidelines and of lab work and spraying activities in the field are necessary. Some exemplary and prompt punitive action may go a long way in preventing further epidemics because it is as clear as the light of the day that the epidemics of 1994-95 have occurred less due to faulty policies and more due to the total collapse of an unsupervised system.

UNITED STATES

Mending Medi(

AB

The relevance of the issues raised in the debate on mending the Medicare programme in the US extend beyond the US since they involve the question of how to harness the merits of the market in terms of offering a choice while guaranteeing a minimum to everyone.

NEXT to the trials of O J Simpson (the football celebrity who has been arraigned for the murder of his ex-wife and her boyfriend) and Susan Smith (the young woman who killed her two little sons to placate a reluctant lover), the subject that occupies the centre-stage of public attention in the US these days is the future of 'Medicare', the ambitious programme that was instituted 30 years ago to assure health care to the country's senior citizens and the incapacitated.

Created by the Democratic administration under president Lyndon Johnson, the programme runs a government insurance to pay the hospital and doctor bills of the elderly and has been acclaimed as a great success, benefiting 33 million Americans in the age group 65 years and above (together with 4 million disabled), the only group in the country to have universal coverage. Before its advent, any serious illness of a retired person could be ruinous for him and his family and eat up the family's entire savings. Many (more than one-third) went without any treatment as a result.

Despite its achievement and popularity – the longevity of the aged has perceptibly increased – the future of the programme faces a big question mark, the primary reason being its continuously escalating costs and the implications in terms of inter-generational inequity in the tax burden if it is to be maintained in its present form. While everyone agrees that the programme should continue, how to control its costs has been a matter of bitter controversy among politicians and policy-makers with strong ideological overtones.

In the absence of anything concrete from the Democrats as to how to go about the task – their plans to reform the health care system comprehensively having come a cropper last year – the debate has so far focused largely on the model offered by their opponents, the Republicans, that would transform the programme. What this alternative envisages is that the government, instead of paying the bills of doctors and hospitals, would contribute a fixed sum to a health insurance plan on behalf of each medicare beneficiary. As a recent page-long article in the *New York Times* put it, "In the argot of health policy, a defined benefit would be replaced by a defined contribution". The merits of the proposed scheme – commonly called the 'voucher system' – would, according to its proponents, permit the recipients to choose what they want and at the same time enable the government to control the costs which are currently multiplying at an unsustainable annual rate of 10 per cent. Under the new system the beneficiaries will choose from the plans offered by the health management organisations who provide this service to millions of the employed, but at a cost. What the fixed government contribution will mean is that a beneficiary will get a cash rebate if the plan he chooses costs less than the federal payment, but would have to pay the difference if it falls short.

The Democrats maintain that the Republicans' proposal would end the fundamental purpose of the programme, viz, entitlement to first class medical care for all elderly and incapacitated Americans as exercising a choice would expose them to the pitiless and perplexing medical market. "Vouchers are a cruel birthday present on the 30th anniversary of Medicare" said Donna Shalala, secretary of health and human services in the Clinton administration.

At bottom, the differences in the approach of the two parties over the issue – how to mend Medicare – reflect the gulf in their perceptions about how best to balance the budget and on the larger question of what is the proper role of government in matters like health care. What is being asked is, should the elderly be left with no alternative but to look up to a slothful bureaucracy that exclusive health care catering by the government means or can the market be trusted to provide all their insurance needs? The budget balance plan touted by the Republicans and approved by the Congress

promises to end federal deficits in seven years, relying on a spending cut of nearly $ 1 trillion of which $ 270 billion will come from saving on Medicare alone (and $ 180 billion from that on Medicaid, the programme that extends health assistance to the poor).

Relying on a new government analysis, released on the programme's anniversary day, July 30, president Clinton questioned the Republicans' claim that their model of managed care would offer a preferable alternative to the beneficiaries. The Republican plan to restrain the growth of Medicare, the study prepared by the department of health and human services has shown, would mean going under the poverty line for some 5,00,000 elderly Americans who already face difficulty in meeting their essential expenditures. Each of them would have to spend on an average $ 625 more annually than they do now if the Republicans have their way. Even more would be impoverished, the study further says, if block grants were to replace the government medical insurance scheme.

"These cuts would force their families to make choices between generations that no family should have to make", Clinton said in his weekly radio address on July 30. While acknowledging that Medicare needed to be saved from going bankrupt – the Medicare Fund Trustees have warned that the system will go under in seven years unless major steps are taken to change it – the president went on to say, "we do not have to bankrupt older Americans to do it". He claimed that his plan to balance the federal budget in 10 years would also reduce the growth of Medicare by $ 124 billion over the next seven years, but would avoid inflicting the kind of hardship that the Republican plan contemplates in order to finance tax cuts for the rich.

The idea of giving the beneficiaries more choice and greater financial stake in their choices which will result from the government providing only a fixed sum toward purchase of a privately managed medicare policy is endorsed by experts like Henry Aaron of the Brookings Institution and Rubir Reischauer, former director of the Congressional budget office. In order, however, that everyone gets the basic care they would like the government to lay down a package of minimum benefits that must be provided under every plan that the private health management organisations offer.

The Federal Employees' Health Benefit Programme offers a model for the system the Republicans are advocating. Under that programme the government contributes not just a flat sum, but 60 per cent of the average premium for the six biggest health plans. The incentives apparently work and, as the *NYT* article notes, federal employees shop avidly and many have moved into lower-cost plans.

The question that critics ask is does the voucher system mean more opportunities or, in reality, more coercion? If, as the Republicans want, the Medicare budget is to be shrunk by $ 270 billion or 14 per cent over seven years, given the growth of health care and private insurance costs, payment by the government for each beneficiary will grow less, implying an erosion of the value of the voucher.

Of course, the Republicans reject any such prognosis and maintain that their plan would not "shove the elderly into the cold" but would preserve all the benefits they enjoy at present. However, there can be no getting away from the reality that implicit in the Republican proposal is the presumption that those who choose the traditional fee-for-service Medicare facilities would have to pay more by way of higher premiums and their share of the actual medical bills ('deductibles' and 'co-payments').

Recent opinion polls suggest that while there are sharp differences among political parties and among different sections of the people – the wealthy and the indigent – support for sensible reform that would heed the retirees' needs and means has grown and is now large enough for politicians to deal with the basic problem without fearing for their re-election.

The debate over this as also the related questions of reform of 'welfare' and 'Medicaid' will almost certainly be carried over to the next year and will form a major issue in the presidential contest of 1996. The outcome however will have repercussions beyond north America. At bottom is the issue of government vs the market. Believers in the market – who now dominate the policy scene all over the world – will no doubt see in the swing from total government support for health care of the old to limited state involvement and allowing individual choice and management by the market a vindication of their faith. They would however do well to note that what is at issue here is not whether the government should involve itself in seeing that everyone among the old who needs medical attention gets it but what should be the extent and modality of the involvement. There is no question of the federal government reneging on the commitments it gave to the seniors 30 years ago. The search essentially is for ways in which the system can meet the demands it is going to face in the next decade as the aging population explodes and, equally importantly, in which the merits of the market in terms of wider choice can be harnessed while guaranteeing a minimum to everyone. Above all, America is mending and not ending Medicare, a shining symbol of a society's concern for the care of its elderly and incapacitated – a distant dream for a developing country like India where any medical care worth the name remains the privilege of a few.

BOOKS THAT MATTER

WOMEN AND EMPOWERMENT
JAYA KOTHAI PILLAI

Former Vice-chanceller of Mother Teresa University in her learned study critically examines all the aspects of empowerment of women so much being trumped about and separates the facts from fiction with convincing evidence.

Resolving Centre-State Conflicts

Nirmal Mukarji

In the sphere of centre-state relations what we have now is an altogether new ball game. If there are lessons from the past they come from the way the 'exceptions' sector has been handled or rather mishandled – one, that civilised governance must rely more on democratic dialogue than on authoritarian militarism; and, second, that conflict in plural polities must be resolved without flinching from exceptional settlements that respect the aspirations of deeply troubled groups.

IN the discourse in India on centre-state relations three characteristics of the states are often lost sight of.

One is that, unlike in the US, the states in India are not indestructible. Most of the states that are there now were only states-in-the-making the other day. They were born out of processes that are still going on. Therefore new states may keep being created. The present political map of India bears no resemblance to the one at independence in 1947. For all we know tomorrow's map may be substantially different from today's. So when we in India talk of centre-state relations we talk of relations between an indestructible centre and not-so-indestructible states.

The second characteristic is that the states are units not of a federation but of a union, aptly styled a quasi-federation. 'Quasi' because, influenced by the trauma of partition, the constitution-makers opted for a strong centre, arguing that this would help to hold the country together. There is a federal scheme in the shape of division of powers between the centre and the states, but it is heavily skewed in favour of the centre. In practice the centre has become much more powerful than what the constitution-makers visualised. Centralised planning has contributed to this. So has the 'fuehrer' model adopted by the Congress Party, which has been in power at the centre for most of the time.

The third characteristic is the unevenness of the states in size, population and stage of development. Of the 25 states, Uttar Pradesh (UP) is the largest with a population of 140 million or so. At the other end is Sikkim with a population of less than half a million. The constitution treats all of them at par, in that all have to conform to the prescriptive provisions of the part dealing with 'The States'. So each state has a governor, a chief minister, cabinet, legislature, high court, even a chief secretary and a uniformly patterned bureaucracy. Within a state laws and policies apply uniformly to all people and regions. The reality, of course, is that states and regions within the larger states differ widely. When this reality is ignored there is trouble.

I have mentioned these characteristics at the outset because they have a bearing on what I have to say.

I

I shall take the liberty of including states-in-the-making in this presentation, and shall in fact deal with these first.

The plain fact is that the centre has had, and still has, more visible conflicts with this category than with already constituted states. Looking at the past, in most instances the centre refused to yield to the demands from this category until forced to do so. Potti Sriramulu's sacrifice, for instance, forced the centre to divide the old Madras presidency into two separate states of Telugu and Tamil speakers. It also compelled the setting up of the States Reorganisation Commission, which in turn led to a wholesale redrawing of state boundaries largely based on the linguistic-cultural principle. Even then Maharashtra and Gujarat could be constituted as separate states only after much blood was shed over the future of Bombay city, and Punjab only after long and sustained Akali agitations. In the north-east, Nagaland and Mizoram could gain recognition as states only after years of fierce insurgency by the people and fiercer counter-insurgency operations by India's armed forces.

The point to note is that in all such cases there was conflict or potential conflict between the centre and states-in-the-making. Resolution was obtained largely because demands were pressed through coercive means. In some cases the centre responded through its own coercive instruments. Therefore it can be said that, however unpleasant it may sound to a country that claims to be a democracy, it was coercion that eventually produced accommodation. Since ruling classes seldom learn from history the same may happen, and is in fact already happening, in the case of other states-in-the-making. Uttarakhand may well be the first of a new crop of states. It has the backing of two unanimously passed resolutions of the UP legislature. One was passed when the Bharatiya Janata Party (BJP) was in power and the other now when a coalition led by the Samajwadi Party is there.

The other point to note is that in all these cases what was involved was the assertion of group identity. Universal suffrage was expected to arouse the political consciousness of the voters. It did. But through a process of social chemistry still to be fully understood, it has led to people clubbing themselves in groups on some principle or the other. Where such groups have geographical bases they become highly identity-conscious and make demands in the general direction of autonomy and self-governance. Basically this creates bargaining situations where one side demands all and the other is not prepared to concede even an inch. Whether it is Bodoland or Jharkhand or any of the others in the queue, resolution has yet to be achieved. The Gorkha Hill Development Council of Darjeeling, worked out between the centre, the West Bengal state and the leaders of the movement for a separate Gorkhaland, has not worked well. Yet, for the centre as also for the concerned states, it has virtually become the cure-all model to contain the demands of the Bodos and others. 'The council' idea offers self-government well short of statehood. Whether it will succeed in its objective remains to be seen.

These are unresolved situations of conflict or potential conflict, all arising from this sector of states-in-the making and identity assertion.

II

What about already constituted states? In the early years after independence there was no conflict because the centre and all the states were ruled by the same Congress Party. Differences if any between the leaders at the centre and the states were settled within the party.

This happy state – happy for the Congress – ended in 1957 when Kerala elected the first non-Congress government. The dismissal of this Left government two years later on tenuous grounds set a pattern in which, during all the years that Congress ruled at the centre, non-Congress state governments were constantly made to feel uncomfortable and found the going difficult. Often they were toppled, by manipulation or by misuse of the constitutional provision to impose president's rule. Tolerating 'other party' rule has yet to become part of political culture in India. If some non-Congress governments

TECHNOLOGY AND THE RAJ

Western Technology and Technical Transfers to India, 1700-1947
Edited by **Roy MacLeod** and **Deepak Kumar**

A collection of twelve well-researched papers on the relationship between technology and colonialism in British India, *Technology and the Raj* deals with three important areas: the practices shaping and constraining technology transfer and technological and engineering education; patterns emerging in transportation and communication; and principles arising in the struggle for technological sovereignty before political independence in 1947.

STATE AND CIVIL SOCIETY

Explorations in Political Theory
Neera Chandhoke

Through an extensive reading and interpretation of the literature in political theory, this thought-provoking study constructs an entirely fresh theory of civil society that can be used to promote democratic participation and responsibility.

A path-breaking study, it differs from purely theoretical exercises by addressing itself to praxis-oriented politics.

New from... TRACTS FOR THE TIMES

This series deals with issues of contemporary concern. It attempts to provide meaningful information, critical perspectives and theoretical reflections on various themes. The series is edited by a distinguished group of editors, namely S.Gopal, Romila Thapar and Neeladri Bhattacharya.

The Indian Economy Rs 50.00
Crisis, Response and Prospects
A Vaidyanathan

The Indian Economy provides an overview of Indian Economic development in the last four decades since Independence. It traces the evolution of development strategies since 1930s, attempts to understand their rationale, their problems and contradiction. It begins with an evaluation of economic performance under planning and goes on to review the range of arrangements that seek to explain the constraints on growth.

Dalit Visions Rs 45.00
Gail Omvedt

Dalit Vision explores and critiques the sensibility which equates Indian tradition with Hinduism, and Hinduism with Brahmanism, which considers the Vedas as the foundational texts of Indian Culture and discovers within the Aryan Heritage the essence of Indian Civilization. It shows that even secular minds remain imprisoned within this Brahmanical vision, and the language of secular discourse is often steeped in a Hindu ethos. The tract looks at alternative traditions, matured within dalit movements, which have questioned this way of looking at Indian Society and its history. While seeking to understand the varied dalit vision that have sought to alter the terms of the dominant order, this tract persuades us to reconsider our ideas, listen to those voices which we often refuse to hear and understand the visions which seek to change the world in which dalits live.

survived for long periods, as in Tamil Nadu or West Bengal, it was because they acquired near-impregnable bases among the people.

The Congress centre's aversion to non-Congressism in the states was in tune with the slide of the Congress Party into the 'fuehrer' model. A 'fuehrer' neither brooks dissent nor shares power. But the model needs a charismatic vote-catching leader. There is no longer such a leader, and consequently state after state has been voting non-Congress. In this new situation the old game of state governments being toppled by an intolerant centre may be difficult to play, however great the temptation to do so. Electoral politics has, in a curious fashion, resolved this particular manifestation of centre-state conflict, at least for the present. The Congress centre seems to have become weaker and the states perhaps less weak than before.

The really enduring issue that generates differences in the centre-state arena is over-centralisation. Things have come to such a pass that, in addition to central subjects, the centre has become the dominant actor in the concurrent field and even in matters wholly the concern of the states, ranging from an item like the police to an all-embracing subject like rural development. Since there is little difference between the ruling elites at the centre and in most of the states, the phenomenon of over-centralisation has seeped into the polity widely. If the centre has been busy usurping the functions of the states, the states have been doing the very same thing with the functions of local governments. Governance as a whole has moved upwards and away from the people.

Inevitably there are reactions. The states, cutting across party lines, have on this issue turned against the centre; sub-state ethnic and other groups against both, and the people against the entire system. Conflict has become inherent in the totality of the polity, not just between the centre and the states. The underlying issue is how much autonomy the people can exercise in the making of decisions concerning them. To date this has remained unresolved. India saw a lurch towards near-total centralisation during the Emergency of the mid-1970s. It has still to see a genuinely significant move in the opposite direction of decentralised, accountable, people-based, democratic governance.

Put in another way, the issue is not how to resolve differences between the centre and the states. So long as the ruling elites at these levels remain much the same the fight between them, if any, will be only how to share the spoils of power. The real issue is deeper. It is between those who have ruled so far, whether at the centre or in the states, and those who have been ruled over and have been at the receiving end, between the ruling elites and the people.

III

Perhaps the truth is that by and large there have been no real problems between the centre and most of the states. One sees this in the way institutions for discussing centre-state issues have functioned. The Rajya Sabha, which somewhat like the Senate in the US was meant to be a council of the states, has become just another debating forum no more concerned about the states than the Lok Sabha. The National Development Council composed of the prime minister and the chief ministers of all the states meets now and then, set speeches are made and eventually a consensus announced broadly reflecting what the centre has already decided. Much was expected from the Inter-State Council constituted by the National Front government at the centre. It has only succeeded in disappearing from sight.

So we have to turn to the exceptions like Jammu and Kashmir (J and K), Punjab and the North-east which have occasioned tough conflicts. The demand in these places is expressed in evocative vocabulary, such as 'azadi' (independence), 'khud-mukhtari' (self-determination) and the like. The discourse goes way beyond listed powers. It compels thought being given to the hitherto unthinkable. Why should such states not be allowed to write their own constitutions for autonomy? They need be placed under only two constraints, one, that the centre must retain at least the minimum functions, defence and foreign affairs, and some aspects of communications and macro-economic management; and two, that the constitutions so written do not infringe the basic features of the Indian constitution. The doctrine that the national constitution has certain basic features that just cannot be amended, much less deleted, is one of the most creative contributions of the Supreme Court of India in recent years.

It needs to be borne in mind that the state of J and K already has its own constitution. It is another matter that J and K's autonomy has been steadily eroded by the centre in collusion with fraudulently elected governments in that state. What this suggests is that linking provisions tying state constitutions to the national constitution, like the famous Article 370 in the case of J and K, should be treated as unamendable basic features.

This 'exceptions' sector raises two issues. First, is there necessarily merit in insisting on a uniform package of devolution for all states? Should exceptional cases not be allowed specially packaged devolutions geared to their special circumstances? Second, should the extraordinary demands of this 'exceptions' sector be responded to militarily or democratically, through coercion or through dialogue?

On the first issue, as already mentioned, the principle of special packages for individual states was conceded in the shape of Article 370 for J and K. It was later adopted for several other states in a series of provisions stretching from Article 371 to 371G. But the contents of these special packages has been overtaken by militant discontent in some places. India has still to recognise the need for substantially larger special packages for the states undergoing acute problems. There are instead backlash forces in the so-called mainstream demanding the scrapping of even the modest special packages that exist at present.

On the second issue, the mainstream ruling elites spread over all the so-called national political parties seem to be united in support of using primarily the military instrumentality. Which not only constitutes a non-solution but in fact keeps worsening problems.

IV

Lastly, there are larger forces at work. Some sinister, like the rise of religious intolerance and extremism, which led to the destruction of the Babri masjid and the unspeakable outrages of Surat, Bombay and many other places. Others hopeful, like the coming together of countervailing elements amongst disadvantaged sections such as the backward classes and the minorities. These are tending to shake and render out of date the set-piece chessboard of the pre-existing polity configured by the centre and the states, for they cut across state boundaries and draw strength from deeper sources than what the ruling elites have been accustomed to deal with. India is in the midst of a churning process in which regressive and hopefully progressive forces are wrestling with each other. Obviously it is impossible to tell which side will prove to be the eventual victor. But there is the undeniable fact that the BJP which presided over the deplorable mosque demolition at Ayodhya was democratically thrown out of power come next election in UP by a coalition of the backwards and the minorities.

In the face of these new forces, it is doubtful whether there is much to be learnt from the past handling of centre-state differences in India. There is an altogether new ball game. If there are lessons from the past they come from the way the 'exceptions' sector has been handled or rather mishandled. The lessons are mainly two. One, that civilised governance must rely more on democratic dialogue than on authoritarian militarism. Second, that conflict in plural polities must be resolved without flinching from exceptional settlements that respect the aspirations of deeply troubled groups.

In Pursuit of Food Security

M H Suryanarayana

Increasing Access to Food: The Asian Experience edited by D S Tyagi and Vijay Shankar Vyas, Sage Publications, New Delhi, 1990; pp 455, Rs 250.

THIS book is based on the research work of Kellogg International Fellows from Asian countries. It provides a survey of select Asian country experiences in achieving both physical and economic access to food with special focus on government policy measures. That the objectives of food security have been achieved in the context of limited land availability, high man-land ratios and growing population makes these countries' achievements quite creditable. The countries considered are China from among the east Asian countries (China, Korea, and Japan), Indonesia, Philippines and Thailand from among the south-east Asian nations (Indonesia, Malaysia, Philippines and Thailand) and India and Sri Lanka from south Asia (Bangladesh, Burma, India, Nepal, Pakistan and Sri Lanka).

To facilitate a proper appreciation of different policies and their success in achieving food security the book begins with an introduction that provides the background in terms of the initial conditions and a review of the food situation in the recent past in these countries. Most of these countries, despite being predominantly agricultural with a disproportionately large labour force depending on this sector, have been food deficit due to low level of yield per unit of land. In addition they had to operate under constraints like high man-land ratio, growing population, weak infrastructure and mass poverty, the exceptions being Indonesia, Malaysia and Thailand which experienced increasing land-man ratios. Yet thanks to some of the appropriate technology-cum-price policy measures aimed at increasing domestic production and hence import substitution of foodgrains these countries could achieve near self-sufficiency in foodgrains. Foodgrain production exceeded population growth and domestic demand in many countries resulting, sometimes, even in sporadic surpluses of wheat as experienced by India in 1985 and of rice in Indonesia in 1984 and 1985.

The constraints faced, policies pursued and their consequences varied across countries. For instance, in India technology and price policies were instrumental in promoting physical access while a public distribution system combined with poverty alleviation programmes ensured increased economic access to foodgrains. Physical access to food, as measured by per capita availability of foodgrains, and economic access, as measured by proportion of per capita income required to buy a unit of food and relative increases in nominal per capita income and foodgrain prices, has increased in India as found by Tyagi. How the system of public distribution evolved in India and how far it has succeeded in meeting the different objectives of food security are examined by Bapna. The costs of the strategy for procurement of foodgrains for public distribution is much more than the direct monetary costs. For instance, there are costs due to suboptimal resource utilisation and inefficient production associated with price distortions resulting from zoning and inter-state foodgrain movement restrictions for procurement. Bapna examines some of the inadequacies of the public distribution system and finds it to be untargeted, irregular in supplies and expensive. The suggested remedies range from targeting by commodity reorientation in favour of coarse cereals to replacing the system by food stamps.

China has also succeeded in meeting the food needs of its population, which is about one-quarter of the world's population, with only 7 per cent of the world's arable land but by following a different strategy altogether as shown by Wen. Need for increased industrial and foodgrain production to ensure national security involved conflicting price policies like undervaluation of agricultural products to generate investible surplus for industrial development but overpricing foodgrains to reduce their imports by promoting production and curtailing consumption. This conflict was resolved by opting for a strategy of non-pricing policies like production planning based on institutional and technological innovations involving demolition of the rural power structure, land reforms, redistribution of draught animals, collectivisation and combined application of traditional and modern technologies. The price policy was resorted to only to increase rural incomes and influence resource allocation but after the economic reforms in rural China in 1978. As regards economic access, China relied on measures like rationing of basic necessities, confined largely to urban areas with the exception of rural areas designated as specialised industrial/cash crops producing/grain deficit areas, along with income subsidy and wage policies. As regards the rural sector, the emphasis was on self-sufficiency and self-supply of foodgrains which was achieved, of course, with a cost involving disappearance of the rural private sector and lopsided rural economy. The rural economic reforms of 1978 basically sought to undo such imbalances, set up a rural market economy and thereby achieve an economic structural adjustment in rural China. The study by Rui-Zhen examines how China went about securing such adjustment, its success and failures, implications for food security and the need to continue with such reforms.

Indonesia, on other hand achieved increased production of foodgrains, particularly rice, largely as a result of government policies towards production and marketing (Piggot and Treadgold). The policy towards production consisted of investment in research for high-yielding varieties, investment in rural infrastructure, investment in irrigation, price subsidy for inputs, and institutional arrangements (Syariel). Of course, the self-sufficiency in rice, though delicately balanced because of growing population and narrow dietary base consisting only of rice, has been achieved at heavy costs to the treasury in terms of price supports and an array of subsidies. One possible solution being considered at the policy formulation level is diversification of consumer preferences along with the development of the secondary food crops sector (Piggot and Treadgold). As regard food insecurity and malnutrition arising out of poverty, the Indonesian government emphasised the linkage of agricultural development with nutritional improvement and formulated a strategy of direct institutional intervention in providing health and nutrition services. For instance, the national Family Nutrition Improvement Programme, which was implemented at the grass roots level, monitored child growth and offered nutrition education, including training in home gardening to provide nutritional agricultural products, especially vegetables. As a result of all these efforts, infant mortality declined from over 200 per 1,000 live births to 90.1 and life expectancy

increased from 41 years to 54 years between 1960 and 1983-84. Given the multidimensional nature of the problem of poverty and malnutrition, and food and nutrition systems, involving socio-economic and cultural factors, the study pleads, in the context of Indonesian experience, for a holistic 'multidisciplinary socio-technological approach'.

Sri Lanka is another country, though with a per capita income of $ 400 in 1987 ranked among the poorest countries in the world, which has achieved remarkable social progress, thanks to the welfare policies of the government which were implemented vigorously till the economic reforms of 1977 (Pinnaduwage and Abeygunawardena). Like other Asian countries, Sri Lanka also followed a policy of increasing foodgrain production by measures like price support, irrigation investment and fertiliser subsidy schemes. But the major government intervention was with respect to increasing economic access to food through highly subsidised, sometimes even free, distribution of foodgrains. For instance, in 1969-70 rice subsidy contributed 63 calories per day towards per capita consumption of the population and 115 calories per day per capita of the poorest 10 per cent. It was in 1979, as part of the effort to reduce government expenditure and government intervention in the economy, that the four-decade old price subsidy scheme was replaced by a direct income transfer scheme, that is, the food stamp scheme, which option is currently being considered by India also. Hence the Sri Lankan experience should provide useful guidelines. However, barring facts such as that the food stamps were better targeted and the government expenditure on food subsidies declined by one-half, the study does not provide enough details to compare the food stamps with price subsidy schemes and draw policy conclusions.

Among the countries under review Thailand stands out as a success case in achieving food security by free trade policy market mechanism (Konjing). It is one of the six countries in the world producing surplus food for export where growing foreign market potential and market diversification played an important part in promoting domestic crop and livestock production and diversification. This was largely facilitated by a set of favourable government policies which aimed at increasing farm production and farmer's income through improvement of the marketing infrastructure and through market interventions like farm price supports and input price subsidies. As regards food security of low income people, the Thai government procured rice as reserved quotas from exporters and through bidding for distribution through fair price shops. In addition, it sought to improve the nutritional status of the population by specific programmes like nutrition education of mothers, the establishment of child-care, day care and health service centres, institutional feeding programmes such as school lunch programmes, and nutritious food production projects.

Finally, the study on Philippines by Ledesma brings out how important institutional reforms are in ensuring food security, particularly in a society where land-man ratios are highly unfavourable. Philippines is the 15th most populous country in the world. Farm area is highly concentrated with small farms constituting 68 per cent of all farms accounting for only 30 per cent of total farm area. About half of the farms occupying two-thirds of the total area are owner operated and the rest are rented or held under some other arrangement with tenancy arrangement being a major factor. It is against this background that the study dwells at length on the various legislative measures taken by the government for land reforms, but without any evaluation of their success and implications for food security. Instead, it expresses the hope that the reforms, if carried out with the requisite support services, may only provide the starting point for a strategy for transforming the Philippine rural society necessary for improving the food system.

Finally, the book ends with an excellent evaluation of the south Asian countries' experience, their constraints and long-term prospects by Vyas. The experience does not lend any support to the view that the prospect for international food security has improved. Notwithstanding the International Monetary Fund's Food Financing Facility, Food and Agricultural Organisation's Food Security Assistance Scheme, etc, there is need for an international food reserve which would be responsive to the need of poor countries. To ensure food security for the poor, ad hocism towards rural public works programmes, subsidised distribution of foodgrains and direct feeding programmes have to be replaced by a long term, selective and 'saturating' approach. In sum, the book contains some informative and analytical studies of south Asian government policies towards food security.

Poor Attempt at Understanding BJP

Ashok Chousalkar

Hindu Nationalists in India: The Rise of Bharatiya Janata Party by Yogendra K Malik and V B Singh; Vistaar Publications, New Delhi, 1994; pp 262, Rs 275.

THE Bharatiya Janata Party has emerged as a major political force in Indian politics since 1988-89. It has given a new lease of life to Hindu nationalism which till now had a very limited influence on Indian politics. Hence a book on the policies and programmes of the BJP is welcome. The book is primarily written by Yogendra Malik; only a chapter on the electoral performance of the BJP is by V B Singh. Malik contends that the recent upsurge of Hindu nationalism is a reaction of broad Hindu masses against the Nehruvian model of nationalism developed by westernised and secular intellectuals. In its place, the BJP wants to put forward an alternative model of nation-building.

The BJP was established in May 1980 when the truncated Janata Party suffered defeat at the hands of the Congress(I) led by Indira Gandhi. After the electoral defeat the non-Jan Sangh members of the Janata Party wanted to finally resolve the issue of dual membership that dogged the party since its inception. The party passed a resolution disallowing dual membership. As a result, the former Jan Sangh affiliates quit the party and formed the BJP under the leadership of A B Vajpayee. The BJP did not reclaim its previous Jan Sangh ideology. Instead it proclaimed Gandhian socialism as its creed, though the rank and file did not believe in it. After 1985-86 the BJP abandoned its 'pseudo-secularism' and declared its commitment to Hindu nationalism.

According to Malik the Indian nationalists sought to distance themselves from the heritage of Hindu religion, while the Hindu nationalists drew upon Hindu cultural revival and social reform movements of the 19th century. He quotes from the writings of Vivekanand, Sri Aurobindo, Bankimchandra and Tilak to substantiate his point. He discusses the Hindu nationalist critique of the Nehruvian nationalism which asserts that a doctrine out of tune with the culture of the people is not likely to become part of their psychological setup. Malik holds that the reassertion of Hindu nationalism as an alternative ideology of Indian state is based on the claim that the majority in the country has a right to set the goals of the state. Hindu nationalism advocates the cause of a single homogeneous national identity, rejecting India's multi-ethnic reality.

It seems that the author has not correctly understood the historical roots of the rise of Hindu nationalism or of the Indian national movement. The 19th century social movements were in no way related to Hindu nationalism because the reform programme was an anathema to the latter. It is wrong to call Vivekanand, Aurobindo and Tilak as precursors of Hindu nationalism because their agenda was essentially anti-colonial and democratic. They used religious symbols in a given situation to democratise society, and not to use them against the Muslims. They wanted swaraj, both for the Hindus and the Muslims. The social reform movements led by the backward caste leaders struggled against the brahmanical order. The Hindu nationalist parties were established in the second decade of this century to stem the tide of these movements. They were supported by the upper castes who feared the emergence of democratic forces in India. Thus the RSS, which was established in 1925, had nothing to do with national independence, social reforms and democratic movements in the country.

On the one hand the author deplores Hindu nationalism since it encourages divisive tendencies in multi-religious society of India. He finds Deen Dayal Upadhyay's integral humanism full of contradictions. Yet, on the other hand, he hastens to add that India is the motherland and sacred land of Hindus. He maintains that symbols used by Hindu nationalists for internal cohesion and national unity are preconditions of modernisation. The author makes contradictory statements of this kind at many places.

The Jan Sangh, which was established in 1952, gradually spread its influence in north India. But it was during the Jaya Prakash movement, as the author rightly points out, that it spread its wings far and wide. In 1977 the Jan Sangh merged with the Janata Party. The empirical research conducted by the author shows that the BJP leadership has a narrow social base in no way reflecting India's cultural diversity. There is absence of leaders from the minorities and lower classes. Also, it does not have regional leaders with strong roots in their linguistic communities or castes.

Malik fails to take note of the anti-cow slaughter movement launched by the Vishva Hindu Parishad in 1966-67 to derive political benefits in the general elections of 1967. This movement helped the Jan Sangh to emerge as a major oppositional force. (The VHP's Ram Janmabhoomi movement was a repeat performance of the anti-cow slaughter movement.) After the formation of the Janata government in 1977, elections to different state assemblies were held. After the elections, the Lok Dal and the Jan Sangh factions forged an internal alliance and equally distributed amongst themselves the chief ministerships of UP, Haryana, Bihar, Himachal Pradesh, Rajasthan and MP. The Janata Party's fate was sealed when the alliance broke and Lok Dal chief ministers of UP, Bihar and Haryana were forced to resign. It is true that the Jan Sangh faction supported Morarji Desai at the time of the split in July 1979. But Malik is incorrect in saying that there was a competition between Charan Singh and Jagjivan Ram for the leadership of the Janata parliamentary party because by that time, Charan Singh had already resigned from the Janata Party launch his own party, the Janata(S). So Malik has messed up many details. In the BJP's leadership profile he includes upstart leaders like B D Mishra and T N Chaturvedi but does not mention important regional leaders like Kalyan Singh, Shanta Kumar and Keshubhai Patel.

After its formation, the BJP attempted different political strategies but failed to improve its position. It suffered a humiliating defeat in the 1984 parliamentary elections. As a result the party decided to jettison Gandhian socialism. The rank and file of the BJP looked upon Gandhi as a leader who partitioned India and appeased the Muslims. Malik regards that the RSS did not wholeheartedly support the BJP during this period. The Hindu revival was encouraged and promoted by Indira Gandhi to win the support of the masses against the backdrop of Sikh militancy. In 1985 the BJP reverted to the old Jan Sangh line of Hindu nationalism. The ideology of integral humanism replaced Gandhian socialism. L K Advani used the Ram Janmabhoomi card very deftly. In the 1989 parliamentary elections the BJP improved its position considerably. In 1990 assembly elections it formed governments in MP and Himachal Pradesh, and along with the Janata Dal in Gujarat and Rajasthan. The conflict between the Janata Dal and the BJP flared up on the issue of the implementation of the Mandal Commission and the construction of Ram temple in Ayodhya.

After the 1991 elections, the BJP supported Narasimha Rao's government but this policy was abandoned in December 1992 when the Babri masjid was demolished. Malik opines that the secularists displayed political and administrative ineptitude and lack of moral courage by pitting Ram against Babar. According to him Ram represents Hindu cultural tradition and is a national symbol. Narasimha Rao, V P Singh and Arjun Singh

adopted opportunistic -mix to consolidate their vote-banks but their actions carried little conviction. But immediately afterwards Malik writes that the BJP's actions have led to a sense of insecurity among the minorities and no party can rule India without winning the trust of the minorities. The author makes many such confusing statements. It is difficult to believe that Ram can be a symbol of national regeneration because the issue of identity formation in a plural society like India is complex one. Therefore, despite using the Ram card to the hilt, the BJP was able to secure only 21 per cent of total votes. Malik believes in the BJP propaganda that the Ram temple at Ayodhya was built by Vikramaditya and that it was destroyed by Babar a couple of centuries later. It is a well known fact that Vikramaditya belonged to the first century B C and Babar ruled in the 16th century A D. Thus there is a difference of 1,600 years between the two events. Malik should know that the Hindu nationalists deliberately try to blur the lines between myth and history.

The RSS has many frontal organisations, the BJP being one of them. Malik argues that K B Hedgewar, the founder of the RSS, developed an alternative model of nation-building, challenging the Gandhian and Nehruvian models. He mentions that Hedgewar was influenced by V D Savarkar's theory of Hindu nationalism. In fact, the two Savarkar brothers, G D and V D, developed two separate theories of Hindutva. The elder G D Savarkar was closer to the RSS and his theory of nationalism was based on Vedanta spiritualism and disputed superiority of the west. The younger V D Savarkar expounded the theory of Hindutva based on Darwinism. It aimed to harness western science and technology to acquire power. After Hedgewar's demise, M S Golwalkar, who became the sarsanghachalak of the RSS, was influenced by G D Savarkar's theory. V D Savarkar and Golwalkar never got along together.

Malik commits an error in saying that Golwalkar was disinterested in politics. In fact, Golwalkar provided an ideological substance to Hindu nationalism. He was deeply political in the sense that he desired to establish Hindutva hegemony in Indian politics. Yet, in spite of being a well organised body, the RSS cannot mobilise 20 million people at a call. These limitations were seen in 1975-76 and again in 1993 when it failed to put up a fight against the government. Therefore, its strength should not be overestimated.

The author finds BJP's performance in 1991 parliamentary elections startling, as the party doubled its voting percentage and secured 120 seats in the Lok Sabha. The author informs that though the BJP peformed better in the urban areas, it failed to enlist Muslim support. In constituencies where the Muslims are more than 40 per cent of the populace the BJP did well by communally polarising the voter. Yet, amazingly, the author aruges that the BJP's better performance in the urban areas was due to the voters' greater awareness of the minoritism of other parties. He is factually inaccurate in stating that before 1993 assembly elections the unified Janata Dal, the JD (Ajit), the JD (Bahuguna) and the SJP merged to form the JD. In fact, the JD(Ajit) and the JD(Bahuguna) merged with the Janata Dal in 1988-89.

The author considers the wrong policies of the Congress Party and the decay of Indian state as responsible for the rise of BJP. He sees the BJP and the Congress are two primary contestants for power at the national level. According to the author, the National Front is unlikely to emerge as a major player in national politics. Yet, it must be noted that since the NF represents political diversity and regional interests in India, it is wrong to rule it out completely. The NF-LF combine continues to occupy an important place in Indian politics. It needs to be pinpointed that since 1970 the communists had had no alliance with the Muslim League and it is the Congress that has allied with the latter.

Nevertheless, the author regards political unification of the fragmented Hindu society difficult. While doing so the BJP is likely to come under intense pressure from Hindu revivalist and lumper elements, forcing the party to adopt a belligerent approach on social and religious issues. The author finds it hard to predict the future of Hindu nationalism in Indian politics though he is of the view that it is not likely to disappear in the near future.

The book covers different aspects of BJP's politics and gives useful information about its recruitment and electoral performance. The major weakness of the book is the inability of the author to develop his own critical perspective. Therefore he makes contradictory statements which weaken the main thrust of the book, and at times gives the wrong message to the readers. The author lacks adequate information about the ideological underpinnings of Hindu nationalism. Hence, the book leaves much to be desired.

OUTSTANDING BOOKS

RURAL ECONOMY AND DEVELOPMENT : Planning for the future

R. N. Subudhi & A. P. Dash

Discusses how after the advancement in technology Planning methods have got a considerable face lift and by introduction of highly efficient computing machines and with more structured designs, Rural Development process has how become technically sound.

1995 **ISBN 81-7169-337-7** **Rs 250.**

TEACHING OF ECONOMICS

Edited by Kadambari Sharma & Tripat Tuteja

Investigates how legitimately Knowledge of economics contributes to the taking of decisions about teaching of economics.

1995 **ISBN 81-7169-321-0** **Rs 480.**

Sundaram Finance Limited

Registered Office : 21, Patullos Road, Madras 600 002

Speech delivered by Shri T.S. Santhanam, Chairman

at the Fortysecond Annual General Meeting of Sundaram Finance Limited held on 11th August, 1995, at Madras

Ladies and Gentlemen,

I have great pleasure in welcoming you all to the Fortysecond Annual General Meeting of your Company. The Directors' Report and the Audited Accounts for the year ended 31st March, 1995, have been with you for sometime and, with your permission, I shall take them as read.

WORKING RESULTS

Your Company has achieved yet another impressive performance in 1994-95. Total disbursements of the Company during the year amounted to Rs.690 cr. as against Rs.550 cr in the previous year, registering a growth of over 25%. The cumulative receivables under Hire Purchase and Leasing reached a record level of Rs.1215 cr. as against Rs 953 cr., an increase of over 27%.

During the year, your Company mobilised fresh deposits to the tune of Rs.159 cr. and renewed deposits aggregating to Rs 131 cr., posting a gross mobilisation of Rs.290 cr as against Rs.167 cr. in the previous year. Total public deposits outstanding as at 31st March, 1995, amounted to Rs 431 cr. as against Rs.352 cr. in the previous year. Your Company continues to enjoy the highest credit rating 'FAAA' awarded by CRISIL. I wish to place on record my sincere thanks to over 4,50,000 depositors spread all over the country for the trust and confidence reposed in the Company and assure them of the highest level of safety of their hard-earned money and our efficient and personalised service.

The gross profit earned by your Company during the year was Rs.103.21 cr, an increase of 21% over the previous year. The profit after tax increased to Rs.34.38 cr. from Rs 26.65 cr. registering a growth of 29%. Taking into account the continued good performance of the Company, your Directors have announced the much awaited bonus issue, again in the ratio of one for one, making it the third such bonus issue within a decade. Besides, the dividend has been increased to 50% for the year, the highest distribution so far.

The Prudential Norms prescribed by the Reserve Bank of India (RBI) for Non-Banking Finance Companies (NBFCs) came into effect from 31.3.95. Your Company has adhered to the above norms in presenting the accounts for the year ended 31st March, 1995 and met all the requirements comfortably. You will be happy to note that the capital adequacy ratio as on 31.3.95 is 15.25%, well above the prescribed minimum of 6%, thanks to the conservative policies adopted by the Company since inception. The standard assets i.e performing assets, as per RBI's new classification, were at the highest level of 99.3% of the total business assets.

ECONOMIC SCENARIO

The performance of the Indian economy during 1994-95 was reasonable and satisfactory in many dimensions. After having grown at the rate of 4.3% per annum during 1992-93 and 1993-94, the economy registered a growth of about 5.5% during 1994-95. It was after a lapse of over 3 years that an overall growth rate exceeding five per cent has been registered. Both agriculture and industry, with growth rates of around 4% and 8.4%, have contributed to this impressive performance. Of particular significance to your Company was the spurt in the output of the capital goods sector: at over 24%, this stands in shining contrast to the decline of 5% in the previous year (1993-94), and in this context, the key role played by the automobile industry, particularly the commercial vehicle segment, merits special mention.

The outlook for the current year, again, appears quite bright with exports rising, foreign currency inflows continuing, industrial output increasing and agricultural production in full swing in the wake of yet another good, though delayed monsoon. However, there are a few problem areas and weaknesses that must needs be mentioned.

The fiscal and price situations are two major sources of concern. Though the fiscal deficit in 1994-95 was distinctly lower than in the previous year, it still exceeded the budgeted level. The need to prune this deficit has become all the more urgent in the light of the difficulties experienced by the Central Government in its borrowing programmes during the first half of the current calendar year. If this is not done and if the level of Government borrowings is not moderated, the upward pressure on interest rates could get further accentuated. And this could result in adverse knock-on effects over a wide front in the economy, causing a setback to the commendable progress made in fighting inflation, thanks to the RBI's policy measures.

Inadequate infrastructure, particularly in critical areas like Power, Telecommunications, Road network and Ports, is increasingly becoming a major hurdle in sustaining economic growth.

NBFCs - ROLE AND REGULATION

The RBI, while announcing its slack season policy in April 1995, lowered ceilings on bank lendings to all NBFCs and advised financial institutions to moderate their lendings to them on similar lines. Unfortunately, this has also affected the availability of funds to those NBFCs focussing on asset-based financing to priority sectors like road transport, infrastructure development and industrial machinery. These NBFCs have generally played a complementary role to the banking system and the financial institutions: many of them have established an enviable record as cost-effective and profitable intermediaries with a high degree of economic efficiency. Even in the process of mobilising public deposits, they have earned a sound reputation as reliable and efficient repositories with acceptable credit ratings obtained well before this was made mandatory. I appeal to the RBI to reconsider the credit restrictions recently imposed in respect of such registered NBFCs with high credit ratings, engaged in asset financing, who have complied with all the prudential norms and whose end use of funds in the priority sector is properly established.

Likewise, in regard to mobilising public deposits, a level playing field needs to be maintained as between regulated NBFCs and other types of deposit taking entities. One increasingly comes across several such new entities aggressively advertising and canvassing for public deposits, offering rates almost double the maximum rate stipulated by the RBI for regulated NBFCs. Some of the 'innovative schemes' that these entities come up with are also highly risky and detrimental to the interests of unwary depositors. It is, therefore, imperative that the legal and regulatory framework should cover all these types of financial activities also, including prescription of ceiling on interest rates.

During the year 1994-95, the production and sale of commercial vehicles grew by 37.9% and 31.7% respectively. This trend of robust growth has continued during the first quarter of the current year also in all segments of the automotive industry. With the vehicle manufacturers having ambitious targets for capacity expansion and volume growth, the prospects for the automotive industry for the current year remain bright.

Road transport has come to occupy a dominant position in the country's transportation system. The share of road transport in freight traffic has risen from 11% to 60%, and in passenger traffic from 26% to 80% over the last 4 decades; this trend is bound to continue.

The development of roads, however, has not kept pace with the demands of traffic. The increase in the number of vehicles has put tremendous pressure on the road network. The inadequacies of the road network result in heavy loss for the economy in terms of energy consumption, wear and tear of vehicles and time delays. National and State Highways which constitute 10% of the total road length account for 70% of the total traffic. It is estimated that over the next 10-15 years a sum of Rs. 1,52,000 crore will be required for upgrading the current network of National and State Highways and adding 10000 kms of National Expressways to cope with the increase in traffic. However, the total budgetary allocation to this sector is grossly inadequate at less than Rs. 3000 crore per annum.

The recent amendments to the National Highway Act, 1956, should help attract private sector participation in road development. This can, however, play only a supplemental role. The Central/State Governments have to substantially increase their outlay on laying new roads and maintenance and improvement of the existing ones.

The abolition of octroi is another measure that transport operators have been clamouring for since long. The West Bengal Government have recently taken the bold step of doing away with this harsh levy. I earnestly hope that other state governments would soon follow suit in the larger interests of accelerating inter-state movement of goods and putting an end to a costly and inefficient way of collecting revenue that can easily be replaced by other means.

PROSPECTS

Your Company has written an aggregate business of Rs. 267 cr. in Hire Purchase and Leasing in the first four months of the current financial year as against Rs. 175 cr. previously. Although the entry of banks and financial institutions in Hire Purchase and Leasing has intensified the competition, with the good overall growth in the economy, your Company is confident of achieveing a reasonable growth in Hire Purchase and Leasing business this year also by adopting suitable funding strategies and expanding geographically.

India Equipment Leasing Ltd. recorded a good performance during the year and made a profit after tax of Rs. 366 lakhs and declared a higher dividend of 20%. The Company issued bonus shares in the ratio of 1:3 in June 1995 which was followed by a rights issue in the ratio of 1:4 at a premium of Rs. 25/- per share. The rating of the Fixed Deposit programme of the Company has been upgraded to 'MAA+' by ICRA signifying high safety for depositors' funds. The Company also proposes to go in for a public issue later this year.

Sundaram Finance Services Ltd. also performed well during the year and made a profit after tax of Rs. 110 lakhs. This subsidiary declared a maiden dividend of 10%. Sundaram Finance Securities Ltd. performed satisfactorily in its first eight months of operation in stock broking business.

Your Company has also decided to enter Mutual Fund operations in collaboration with M/s Newton Management Ltd., a leading investment management group in the United Kingdom. An Asset Management Company is proposed to be incorporated for the purpose. Your Company also has plans to obtain membership on the National Stock Exchange of India Ltd., to widen its stock broking activity.

Your Company still awaits Government's response to the recommendations of the Malhotra Committee on reforms in the insurance sector before drawing up specific plans for diversification into general insurance business.

SUNDARAM MEDICAL FOUNDATION

Your Company has always endeavoured, in fulfillment of its social responsibilities, to contribute its mite to the well-being of the community wherefrom it draws its own growth and sustenance. The latest and most noteworthy example of this is **Sundaram Medical Foundation**, a non-profit trust, set up by Sundaram Finance and its associates, with the objective of providing quality medical care to the community at affordable cost. A 100-bed well-equipped community care hospital has started functioning in Anna Nagar, Madras since September 1994 under the auspices of this Foundation. The capital cost of this hospital has been funded largely by donations made by your Company and its associates. I am happy to say that this community care hospital has already emerged as a "centre of excellence" in its field of activity.

On behalf of the Board of Directors and on my own behalf, I take this opportunity to thank our depositors, customers, bankers, financial institutions and all the shareholders for the co-operation and assistance extended to your Company and look forward to their continued support. I also place on record my appreciation of the good work done by all members of staff both in the field and in the office.

Note : This does not purport to be the proceedings of the Annual General Meeting of the Company.

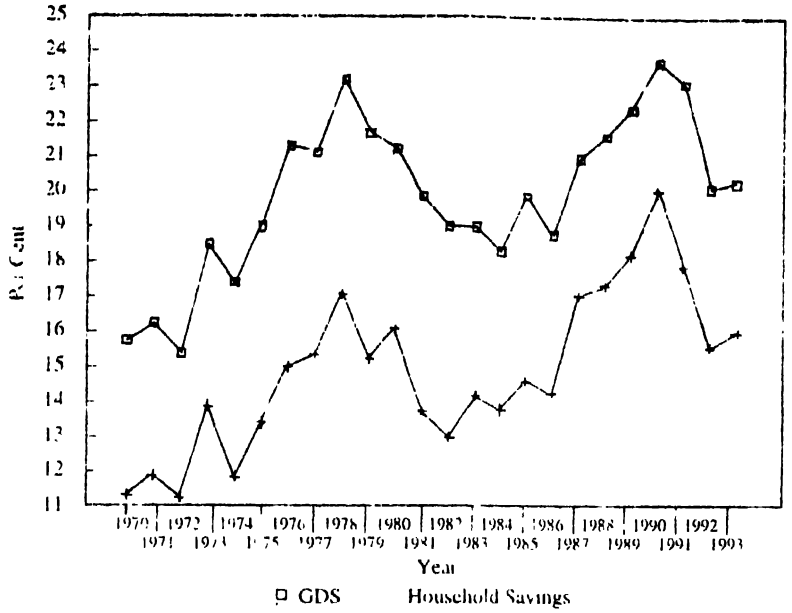
Economic Reforms and Rate of Saving in India

Premachandra Athukorala
Kunal Sen

This paper contributes to the current debate on the decline in the domestic saving rate in India in the aftermath of the liberalisation reforms initiated in 1991. It is found that the decline in the saving rate has predominantly originated in household physical saving, the main subcategory of saving which is common to both saving and investment estimates prepared by the CSO. Given that the persistent decline in household physical saving has occurred in a context where private corporate investment has exhibited strong growth and that there is no evidence of an intrinsic bias in the new policy regime against the unorganised sector, we suspect that the decline in the saving rate is a statistical artefact resulting from an underestimation of total gross domestic capital formation.

I
Introduction

THE behaviour of domestic savings has been one of the key issues in the current debate on the process of adjustment in the Indian economy following the market-oriented policy reforms initiated in 1991. An important objective of the reform process is to improve India's balance of payments position without sacrificing output growth. The attainment of this objective depends crucially on an improvement in the savings performance of the economy. As the development experience of the Asian newly industrialising countries clearly demonstrate, rapid and sustained economic growth is consistent with external equilibrium only if the economy can domestically generate an increasing share of investible funds needed for such growth. Viewed in this context, the emphasis in the current debate on the behaviour of domestic savings since the reforms is entirely justified.



The official data on domestic savings (generated by the National Statistical Organisation, CSO) point to a decline in the saving rate (the ratio of gross domestic savings to GDP) since 1991. This decline can be seen as a reversal of the upward trend in the savings rate since the mid-1980s. Two schools of thought have emerged to 'explain' this disappointing saving performance in the post-reform period. One view as expressed in *The Economic Survey 1994-95* (which we can call the 'official' view) takes the position that the decline in the savings rate is possibly 'spurious' as it is not consistent with economic fundamentals. This view, therefore, calls for a review of the 'methodology for estimating savings and capital formation in the economy" (*Economic Survey 1994-95*, p 3). A second view holds that the decline in the savings rate is in fact 'real' and is an unintended consequence of the reform process [Rao 1995; *EPW* 1995, *EPW* Research Foundation 1995]. For instance *EPW* Research Foundation (henceforth EPWRF) argue, "it is beyond doubt true that the definitive thrust of new economic policy is to promote higher economic growth by promoting consumption by the very middle and high-income classes" [EPWRF 1995 1040]. EPWRF further argues that there is an upward bias in the measurement of household financial savings in recent years and this, if corrected, will further accentuate the fall in the reported savings rate. The persistent fall in the savings rate and the belief that conspicuous consumption among the rich and middle class in the post reform economy has contributed to this fall have provided breeding ground for a powerful lobby against proposed loosening up of quantitative import restrictions on consumer goods [Duncan 1995 16].

The purpose of the paper is to contribute to this debate through a careful analysis of disaggregated saving data while paying attention to measurement issues and economic fundamentals which underpin saving behaviour. In Section II, we provide an overview of the salient features of behaviour of savings in the recent past highlighting certain key aspects of the data that has been overlooked in the current debate. In particular, we note that the decline in the savings rate since 1991 has been driven by the fall in household physical savings. Since household physical savings is obtained from the capital formation accounts, we argue that the answer to the savings decline must necessarily lie either in the behaviour of household capital formation or in its measurement. In Section III we explore to what extent the apparent decline in household capital formation is real or a 'statistical artefact'. In Section IV, we critically evaluate EPWRF's claims that household financial savings are 'over estimated'. Section V concludes.

II
Savings Behaviour: An Overview

The key features of the behaviour of the gross domestic savings rate in the recent past are well known by now and can be briefly summarised [for further discussions, see Rao 1990, Roy and Sen 1991; EPWRF 1995]. Firstly, the savings rate increased over the second half of the 1980s to a peak of 23.7 per cent in 1990-91. It then fell sharply in the next two years to 20 per cent in 1992-93. It remained around that level in 1993-94. It is important to note here that the decline is observable only when the comparison is made with the last three years of the 1980s (Table 1). Secondly, the fall in the savings rate has been mostly due to the fall in the total household savings rate (Figure 1.) The household savings rate has fallen from a peak of 20 per cent in 1990-91 to 15.9 per cent in 1993-94. While the public sector savings rate has shown a negative trend over much of the 1980s and 1990s, the contribution of public sector savings to total domestic savings (around 1-2 per cent of GDP in late 1980s) has not been large enough to explain the sharp downturn in the gross domestic savings rate. The corporate savings rate, on the other hand, has increased steadily over time. A point worthy of mention here is that there was a dip in the gross domestic savings rate in the early 1980s (similar to what one is witnessing in the early 1990s) — a feature of the behaviour of savings in the Indian economy that has remained an unresolved 'puzzle' in the literature [on this, see Roy and Sen 1991]. We shall return to this point in a later section. Thirdly, the data clearly indicates that the decline in the total household savings rate has been due to a corresponding decline in the rate of household physical savings (Figure 2). There has been a significant fall in the latter from a peak of 11.3 per cent (of GDP) in 1990-91 to 5.6 per cent in 1993-94, that is, a halving of the household physical savings rate in a space of three years. Household financial savings as a percentage of GDP has, on the other hand, increased over time to a peak of 10.3 per cent in 1993-94. Since household savings in physical assets contributed approximately half of the total domestic savings in the entire economy in

FIGURE 1: GROSS DOMESTIC SAVINGS AND TOTAL HOUSEHOLD SAVINGS
(as a per cent of GDP)

the late 1980s, clearly the sharp decrease in the household physical savings rate is the most important factor behind the recent decline in the savings rate. Therefore the explanation of the decline in the savings rate in the Indian economy in the recent past must necessarily lie in the behaviour of household savings in physical assets.

To set the stage for the ensuing discussion, it is necessary to gain a clear understanding about the way household physical investment is measured in CSO saving/investment estimates. The household sector, as defined by the CSO, is highly heterogeneous in character and is virtually synonymous with the unorganised sector of the economy. Apart from the 'household proper', it includes non-government non-corporate enterprises, unregistered small-scale household industries, and non-profit charitable institutions. Given this heterogeneous character, household savings in CSO data (which account for 60 to 80 per cent of total domestic saving) is a residual derived by deducting public and corporate savings (directly estimated from public and corporate accounts) from total saving.

The starting point of the procedure for estimating household saving is the estimation of gross total domestic fixed capital formation using the commodity flow method [for details, see RBI 1982, Rakshit 1983; CSO 1989]. Household physical saving is then derived as a residual by subtracting government and corporate physical capital formation (directly estimated using government and corporate financial statements) from total physical capital formation. The component of household physical saving (savings in total physical assets) in Indian saving data is therefore identical to the component of household investment in physical assets in domestic investment data. The household sector's financial saving is arrived at by deducting the government and corporate sector's holding of financial assets from the total of such assets in the economy. Thus in the cases of both physical saving and financial saving any error in estimated totals and the estimates for the other two sectors are eventually reflected in the estimates for the household sector. However, in the case of financial saving this is not considered a serious problem because both the other two components and the total are based on fairly reliable primary data. This is not so in the case of physical saving. While investment estimates for the public sector and corporate sector may be considered reasonably reliable, estimates of total investment (from which the former two components are deducted to derive household physical saving) is subject to significant biases and errors arising from the nature of the commodity flow method used in estimating that aggregate [see RBI 1982, Rakshit 1983 and Srinivasan 1994 for details]. Since household physical savings is obtained as a residual, any biases and errors in the measurement of gross domestic capital formation (as well possible biases in investment estimates for the public and corporate sectors) would be reflected in the estimation of household physical savings.

In this context, one can offer two possible explanations for the observed decline in household physical savings — one, that the decline in the latter is 'real' and related to the process of adjustment in the Indian economy since the onset of reforms in 1991, and the other, that this decline is a 'statistical artefact' and is due to the possible measurement errors arising from the estimation of gross domestic capital formation (GDCF). We examine each of these explanations in turn in the next section.

III
Decline in Household Physical Savings: Real or Statistical Artefact?

As noted, the decline in the household saving rate in post-reform years has predominantly come from the decline in the rate of household gross domestic capital formation (= household physical savings rate). Interestingly, this significant fall in household investment rate has occurred in a context where the private corporate investment rate has recorded an impressive increase by any historical standard (Table 2). The latter increased from 4.7 per cent in 1990-91 to 6.8 per cent in 1993-94. While there has been a marginal fall in the public sector investment to GDP ratio, the fall in the gross investment rate, which is similar in magnitude to the fall in the saving rate, has predominantly originated in the fall in the ratio of household gross capital formation to GDP.

This intriguing inverse relationship between private corporate capital formation and household capital formation in the Indian economy as revealed by the CSO data is not a peculiar post-reform phenomenon. It is an important 'stylised fact' of the sectoral

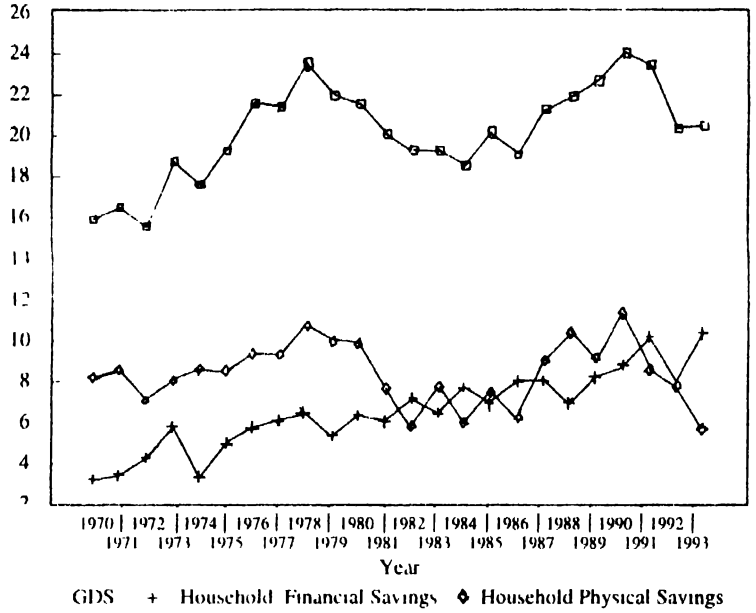


TABLE 1: GROSS DOMESTIC SAVINGS AND ITS SECTORAL DISAGGREGATION
(as a per cent of GDP)

Year	Household Sector			Private Corporate Sector	Public Sector	Gross Domestic Savings
	Physical Savings	Financial Savings	Total Savings			
1985-86	7.5	7.1	14.6	2.0	3.2	19.8
1986-87	6.2	8.0	14.2	1.8	2.7	18.7
1987-88	8.9	8.0	17.0	1.7	2.2	20.9
1988-89	10.4	6.9	17.3	2.2	2.0	21.6

(as a per cent of GDP)

behaviour of capital formation in India as revealed by the official national account statistics [Joshi and Little 1994:315]. This is most clearly seen in Figure 3. Given the method of estimation used, this stylised fact provides the first indication that there may be errors in the measurement of household physical savings. To return to our point earlier about the savings puzzle of the early 1980s, Figure 3 clearly shows that the sharp decrease in the household physical savings rate in this period coincides with an increase of similar magnitude in the corporate investment rate. It can be hypothesised at this stage that there may be a common explanation behind the savings behaviour of the early 1980s and 1990s and this has essentially to do with the measurement of GDCF.

As noted, the term 'households' as used in national accounts is a misnomer. The household sector includes not only individuals but also non-government unincorporated enterprises such as proprietorship and partnership firms and the unregistered small-scale industrial sector. Moreover as we will see later in this paper, the distinction between the 'household' sector and the corporate sector in terms of their domains of operation has gradually disappeared due to various factors emanating from the regulatory system. In theory, the same set of economic factors should drive investment decisions in the private sector, whether they be private corporate firms or unincorporated enterprises.[3] As the Raj Committee aptly put it, 'Investment behaviour in the unincorporated enterprises has to be viewed in [the] wider context as part of the growth of private business enterprises within the economy' [RBI 1991].[4] The negative relationship between the two investment rates is, therefore, difficult to explain in terms of economic behaviour. Since the estimates for private corporate investment can be considered to be more reliable (obtained as they are from the balance sheets of the RBI's sample of firms), one can expect that in a context where corporate investment exhibits an increase (decrease) any underestimation of gross domestic capital formation by the commodity flow method in a given year would result in a spurious downward (upward) movement of household capital formation (and therefore household saving in physical assets) in that year. The sharp decline in the rate of household physical investment (= household savings in physical assets) during the period since 1991 can, therefore, be considered real only if we have sufficient reasons to believe that the incentive structure and the institutional setting created by the new (post-1991) policy regime embodied an intrinsic bias in favour of corporate investment and against non-corporate and household investment.

There is no evidence of the existence of such a situation during the post-1991 period. In fact, the new trade liberalisation and industrial delicensing policies have been designed in such a way that the performance of unincorporated and small-scale production units are cushioned against adjustment pains in the process of economic opening, reflecting a continued adherence to the age-old tenet of 'small-scale reservations' in Indian development planning [Bhagwati and Srinivasan 1993; Duncan 1995]. Even though imports of capital goods and of intermediates have been largely liberalised compared to pre-1991, imports of consumer goods are severely constrained by quantitative restrictions (QRs), coming principally under the so-called Negative List under the Import Policy. The tariff structure too still has a bias against consumer goods (as does the QR policy structure), though in a much diminished fashion. These features of the trade regime suggest the effective rate of protection (ERP) (protection to a process of production or to 'value added' in an activity) for the so-called household sector production activities would have in fact increased as compared to that for private corporate sector production during the post-reform years. At the same time, entry barriers in many product sectors where small-scale units tend to show a greater concentration remain virtually intact; over 800 items, including most consumer goods, are reserved for the 'small-scale' sector — companies with an investment of less than six million rupees [Duncan 1995:16]. In consistent with this small-scale bias in the policy regime, most industries in the consumer goods sector have in fact performed better than the average for the manufacturing sector, in particular in the year 1993-94 (Table 3). Several of these industries have found to be small establishment oriented [see Ramaswamy 1994] and their performance provides indirect evidence on the relative performance of small-scale firms in recent years.

EPWRF (1995) pays attention to a decline in household financial liabilities in recent

years as a potential explicator of the decline is household physical investment (saving). This view implicitly assumes a close positive relationship between household financial liabilities (essentially bank loans to the household sector) and household physical investment (savings), a relationship which is yet to be established empirically. While this may be true on a secular basis, it would be misleading to draw conclusions about the behaviour of household physical savings from movements in household financial liabilities (which arguably is relatively 'free' of measurement errors). As is clear from Figure 4, there have several years in the recent past when the direction of change in these two variables have not coincided - for example, the years 1990-91 and 1992-93. In any case, as Roy and Sen (1994) argue, it is household investment in machinery (and not total physical assets) that should be more closely related to household financial liabilities.

Economic policy reforms opened up opportunities for increased participation of foreign investment in the corporate sector of the economy. However, while the new policy has certainly created increased interest of foreign investors in Indian markets, "this has not yet translated into substantial acceleration of foreign direct investment (FDI) involving actual increases in productive capacity" [JM 1994:463]. Most of private capital inflows have taken the form of portfolio investment. Of the relatively modest volume of FDI inflows, the lion's share has gone to the purchase of existing productive assets rather than to expand the productive capacity in the corporate sector [Chaudhuri 1995]. In any case FDI participation only serve to provide an explanation for the increase in the corporate investment rate, not for the decline in household saving rate. (There is no plausible trade-off between FDI inflow and household investment!).

As EPWRF (1995:1023) correctly points out, the reduced incidence of corporate taxation would have contributed, to some extent, to the recent improvement in corporate saving and investment. While it is difficult to quantify the magnitude of this influence, it is unrealistic to place too much emphasis on it in explaining the distinct investment performance of the corporate sector compared to the household sector.

It is evident from the above discussion that the apparent decline in the household investment in physical capital (and hence household savings rate), which has in turn reflected in a significant decline in the total savings rate in the economy since 1991, has largely, if not entirely, emanated from an underestimation of GDCF in recent years. Why should there be a systematic downwards bias in the measurement of GDCF? Put in another way, has there been any specific

developments in the Indian economy since 1991 that render the old methodology of measuring capital formation vulnerable to measurement errors?

This issue can be meaningfully resolved only through a careful study of the estimation procedure adopted by the CSO in generating its saving and investment data, in particular the key aspects of the commodity flow method of investment estimation, while paying attention to possible inconsistencies between the procedures used and changing patterns of production relations in the economy. However, in the light of readily available evidence, we can suggest two possible explanations. The first explanation relates to the ongoing process of 'informalisation of the Indian industry since the early 1980s, largely in response to stringent labour legislation and other institutional constraints (such as stringent closure restrictions) [RBI 1982; Ahluwalia 1991; Duncan 1995]. The informal (unorganised) sector comprising unincorporated firms and household production units in manufacturing has continued to grow mostly at the expense of the relative importance of the private corporate sector during the period, since the early 1980s. To quote Ahluwalia (1991:14),

> Admittedly small industry is the home of unrecorded growth...Some of the growth may have been growth displaced from the large-scale sector because of the competitive (small vs large) nature of policies. There is reason to believe that some protectionist policies for the small-scale sector have led to the fragmentation of some large-scale units into small ones in order to gain from such protection.

This process of informalisation of domestic industry would have perhaps intensified following policy reforms in 1991 for two reasons. First, as discussed, the incentive structures seems to have changed in favour of manufacturing sectors suited for the profitable operation of small-scale units. Secondly there is some evidence of a new emphasis on export-oriented production activities which requires greater flexibility in labour relations to maintain international competitiveness [Duncan 1995]. In a context where the relative contribution of informal sector production units continue to grow at a rapid rate, estimates based on the commodity flow method are likely to understate domestic capital formation, unless the estimation procedures are revised on a continual basis in order to capture construction material, machinery and other investment goods produced in the unorganised sector.

Our second explanation relates to rapid growth of capital (and intermediate) goods imports as a result of import liberalisation initiatives since 1991. The index (1978-79 = 100) of machinery imports increased from 441 in 1990-91 to 572 in 1992-93 and then to 696 in the second quarter of 1993-94 (CSO, *Monthly Bulletin of Statistics*,

TABLE 4: GROSS SAVINGS OF HOUSEHOLD SECTOR IN TOTAL FINANCIAL ASSETS AND IN CURRENCY AND BANK DEPOSITS (as a per cent of GDP)

Year	Gross Savings in Currency	Gross Savings in Bank Deposits	Gross Savings in Total Financial Assets
1980-81	1.2	4.1	8.9
1981-82	0.6	3.3	8.5
1982-83	1.1	3.7	9.0
1983-84	1.3	3.8	9.1

Source: EPWRF (1995)

October 1994). This rapid import growth in the post-reform economy implies a continuous increase in the share of imported capital goods in total domestic availability of capital goods. Given the time lag involved in the compilation of trade data, it is likely that the estimates of total fixed capital formation obtained by using a historical ratio of imported to total available capital goods understate increases in capital formation based on imported capital goods in the post-reform economy, at least in the most recent year for which data is reported.

IV
'Overestimation' of Financial Savings: An Evaluation

In the current debate on the recent behaviour of savings in India EPWRF (1995) has argued that there is an overestimation of household financial savings in 1993-94 and this overestimation if corrected will show up a further fall in the savings rate. This argument takes as its starting point the sharp increase in household savings in currency and bank deposits, the latter increasing from 0.9 per cent of GDP in 1992-93 to 1.7 per cent of GDP in 1993-94 while the former increased from 3.6 per cent of GDP in 1992-93 to 4.4 per cent of GDP in 1993-94. EPWRF (1995) argues that this significant increase in household holdings of financial assets can be attributed to two factors which are transitory in nature: (a) massive purchases of local stocks and shares by foreign institutional investors in the aftermath of policy reforms, and (b) rapid increase in foreign remittances to the household sector mainly in response to the significant depreciation of the rupee as part of policy reforms.

Before we critically evaluate EPWRF's arguments, two salient features of household financial savings behaviour over the past two decades should be pointed out. Firstly, there has been fairly stable upward trend in gross financial savings (what ERF calls savings of pure households) (Figure 5). In this context, the behaviour of financial savings in 1993-94 cannot be considered as an outlier. Secondly, there has been considerable fluctuation in the ratios of household savings in currency and in bank deposits as a per cent of GDP, the former fluctuating within the range 0.6 to 1.7 (as per cent of GDP) in 1980-94 and the latter fluctuating between 3.1 to 4.4 per cent of GDP in the same period (Table 4). Therefore, given the historical pattern of behaviour of these two variables, the data does not indicate that household savings in currency and bank deposits in 1993-94 has been 'abnormal'. These two points should be kept in mind when considering the savings performance of the household sector in 1993-94.

According to EPWRF (1995: 1030), the injection of money to the economy though FII purchases of local stocks and shares was "essentially the [main] factor that contributed to an expansion in currency and also to an extent in bank deposits in 1993-94 which as result of the methodology of estimation of household savings, got reflected in higher financial saving in the form of these very financial assets". EPWRF argues that there are two possible sources of overestimation. Firstly, the use of historical ratios for apportioning household portion in currency and deposits which are not valid in the current context, and secondly, the estimation procedure not taking into account the dissaving of households in their sale of shares and debentures to Foreign Institutional Investors (FIIs).

There can be no argument with EPWRF's assertion that historical ratios derived from an earlier period may not be valid in the current period. However, it would be misleading to infer from this that there has been an 'overestimation' of total domestic savings in India in the recent past. While use of past historical ratios may incorrectly ascribe the increase in currency and bank deposits to go to households, it can only lead to an overestimation of household financial savings, not of total domestic savings. Since the holding of currency and bank deposits is a combined portfolio decision of all agents in the economy, these two assets will have to be held by some sector in the economy, whether it be households, the corporate sector or the government. Therefore, an overestimation of household holdings of currency and bank deposits will lead to an underestimation of the financial savings of some other sector and will only affect the composition of savings. ERF's argument would only be valid if there is a bunching of the increase in currency and deposits towards the end of the financial year (since estimates of savings in currency and bank deposits are based on data for the end of the financial year). Presumably the implicit argument here would be that such a situation is one of 'disequilibrium' in agents' portfolio and consumption decisions with actual holdings of currency and deposits not reflecting desired holdings. Yet as Figure 6 makes clear, there does not seem to any indication in the behaviour of currency with the public and total demand and time deposits that there has been a surge in these two assets towards the end of the financial year 1993-94.

The possible impact of sizeable foreign inward remittances by Indian expatriates on the growth of household saving in the form of money balances was discussed for the first time in the Raj Committee Report [RBI 1982: Appendix VI]. The comment by Rakshit (1983: 761) on this issue in his splendid critique of the Raj Committee report is equally relevant for an assessment of EPWRF view on transitory increase in financial savings. To quote Rakshit,

> There are fallacies galore in this 'explanation' of the rise in the financial saving ratio of households. It is true that... foreign inward remittances initially raise moneyholdings of households, but so do money wages or any other type monetary receipts of households. The fact that some receipts initially raise money balances is of no importance in explaining why households find it advantageous to hold a larger fraction of their savings in the form of currency and bank deposits.

Even if we (falsely) believe that remittances are fully translated into household financial savings (i.e, marginal propensity to save out of remittances is unity), increase in remittances could account for only about 0.7 percentage point increase in the average rate of household financial saving in 1991-92 and 1993-94 over the average level for the preceding three years [calculation based on Table 7 in EPWRF 1995].

Conclusion

In this paper we have attempted to contribute to the current debate on the decline in the domestic saving rate in India following the liberalisation reforms initiated in 1991. In search of sources of decline in the official (CSO) saving rate we carefully analysed disaggregated saving data while paying attention to measurement issues and economic fundamentals which undergird saving behaviour.

It is found that the decline in the saving rate has predominantly originated in household physical saving, the main subcategory of saving which is common to both saving and investment estimates prepared by the CSO. Household physical saving is derived as a residual by deducting directly estimated public and corporate investment from total capital formation estimated using the commodity flow method. Given that the persistent decline in household physical saving thus derived has occurred in a context where private corporate investment have exhibited record growth, we suspect that the decline in domestic saving rate as reflected in official data is a statistical artefact resulting from an underestimation bias in the estimation of total gross domestic capital formation. Relating to this point, there is neither a sound economic reasoning nor empirical evidence to argue that the reform process has been specifically damaging to the investment performance of the household sector. We also failed to find any convincing evidence to suggest that there has been an

overestimation of total domestic savings emanating from an abnormal (transitory) increase in the rate of household financial saving during the post-reform era

RESCHEDULED DATES

NATIONAL SEMINAR

ON

PROBLEMS AND CHALLENGES OF TECHNOLOGY TRANSFER, IN-HOUSE R & D AND INDIGENOUS TECHNOLOGY FOR INDIAN INDUSTRY IN THE 1990s

TO BE HELD AT IIT, BOMBAY, UNDER THE AUSPICES OF THE DEPARTMENT OF H & S S

ON 22-24 JANUARY 1996

This is an inter-disciplinary seminar touching upon S & T policy, and the economic, legal and technical aspects of the theme under the changing conditions ushered in by liberalization of policies.

Participation and contribution of papers is solicited from social scientists, scientists, scientists and engineers/technocrats both from industry and academia.

Send abstract and title by 30 September 1995.

For further details write to:

Planning for Delhi and National Capital Region

Review of Plan Formulation and Implementation

V Nath

This paper reviews the current status of urban and regional planning for Delhi and the national capital region, against the background of socio-economic and demographic changes that have occurred during the last three decades.

I
Introduction

IN an earlier paper published in this journal [Nath 1988] the present author had reviewed the status of planning for the national capital region (NCR) (see the figure). The review referred to the constitution of the NCR planning board (NCRPB) in 1985 and presented a summary of the objects, strategy and principal recommendations of the interim development plan and the draft regional plan (DRP) for the NCR that had been prepared by the board before the preparation of the 'Regional Plan 2001' (RP). The latter was finalised and approved by all the governments concerned – of UP, Haryana and Rajasthan, the union territory of Delhi and the centre – in July 1988 and became effective in January 1989. The draft second master plan for Delhi had been prepared by the Delhi Development Authority (DDA) in 1985 but it had to be revised because it was not approved either by the government of Delhi or by central government. Since the NCRPB had been constituted in the same year and had started preparation of the RP, the central government wanted the master plan for Delhi to conform to the objects, strategy and policies of the RP. A revised master plan (MPD-II) was prepared along these lines; it was approved by both governments and was enforced on August 1, 1990 [DDA 1990:15].

The interval of almost a decade between the termination of the first master plan of Delhi, 1962-81 (MPD-I), and the beginning of MPD-II has been a major factor in the unbalanced spatial expansion of the Delhi urban agglomeration (DUA), particularly its growth into the areas around the built-up area of Delhi in 1962, which had been designated in MPD-I as the green belt. Incursions into the green belt have been maximum in two locations: (a) along the highways connecting Delhi with its satellite towns, Ghaziabad, Faridabad and Gurgaon, and (b) into the Aravali ridge, which had been designated in MPD-I as a nature preserve. Large parts of the ridge, located within the DUA, have been built over so much that the original woodland is hardly visible.

The interval contributed also to the further growth of a large number of unauthorised colonies, squatter settlements and slums. They had been mushrooming even during the period of MPD-I for two reasons:

(i) large in-migration into Delhi with the great majority of the migrants being poor, and

(ii) freezing of all land for urban development in the union territory by its government.

Hereafter, the DDA alone would have the right to acquire and develop land for residential, commercial, industrial or other uses. The decision was taken to ensure that all development within the UT was according to MPD-I. It did achieve this object, but it also had the unforeseen result mentioned above. The process has continued until it is estimated that "about two-thirds of Delhi's housing stock is located in squatter colonies, other unauthorised and sub-standard settlements and notified slum areas. Estimates show that Delhi's squatter households have increased seven-fold between 1961 and 1991 from 40,000 to 300,000" (interview with C Noronha, member-secretary, NCRPB).

The object of this paper is to review the current status of urban and regional planning for Delhi and the national capital region. The review is presented against the background of the changes – demographic, other socio-economic and in spatial expansion of the DUA and of the satellite towns of Delhi – that have occurred during the last three decades. It analyses the nature, objects and strategies of both plans and explains the relationship between them. It focuses, in particular, on the adequacy of the two plans in meeting the objects.

The paper is divided into seven sections. The growth of the population of Delhi since 1961 and changes in its economic structure are described in Section II. Section III contains a brief review of plan formulation and implementation during the three decades 1962-91 and a comparison of RP and MPD-II. The implementation of both plans is discussed in Section IV. This section contains also a brief description of the construction programme of DDA. The steps taken to restructure and reform the DDA are described in Section V which provide the background to some of the recommendations made in Section VII. The prospect for the decade 1991-2001 is discussed in Section VI. Section VII contains a number of recommendations. These relate, in particular, to restructuring of the DDA and reform of other organisations which provide essential services to the DUA. It should be mentioned that several recommendations are in line with accepted policies of the central and state governments.

The appendix is devoted to:

(i) description of growth of population during 1971-91, economic structure, development problems and projects being implemented or planned to alleviate them in the six DMA and eight priority towns/cities located within the NCR, and

(ii) evaluation of the prospect of the town/city reaching by 2001 the population assigned to it in RP. It may be added that NCRPB proposes to revise the assigned populations for all the 14 towns/cities in 1994.

II
Demographic and Related Socio-Economic Trends

Growth of Population

Data on growth of population of the union territory of Delhi during the three decades 1961-91 are given in Table 1. The total population increased from 2.66 million in 1961 to 9.42 million in 1991, or by 255 per cent. The growth rate during individual decades varied within a narrow range of 51 and 53 per cent. But there were large differences in the inter-decadal rates of growth of the urban population, on the one hand, and the rural population on the other. The growth rates of the urban population ranged between a low of 46.9 per cent during 1981-91 to a high of 58 per cent during 1971-81. But the growth rate of the rural population declined abruptly from almost 40 per cent during 1961-71 to 8 per cent during 1971-81 to jump back to 110 per cent during 1981-91. The reasons for these sharp fluctuations need to be investigated. The sharp fall in the growth rate of the rural population during 1971-81 could be due to incorporation of a large number of villages within the municipal corporation of Delhi (MCD) as a result of extension of its boundaries, while the high growth rate in the next decade could be due to the large number of people, working in DUA, using the villages as dormitories because of lower rents than near their work places located within the DUA. It may be added that almost the entire deficit in housing (the difference between the number of households and

number of occupied houses) in 1991 was in urban Delhi [Registrar General and Census Commissioner 1991a:26]. Accordingly, it is safer to use the total population of the union territory, 90 per cent urban, for any analysis, than the urban or rural populations separately.

Data on the growth of population of Delhi during the four decades 1951-91, and the contribution of migration to this growth, are given in Table 2. The population increased by more than 50 per cent in every decade. Data on the number of migrants into Delhi, which are available only for the three decades 1951-81, indicate that in two of them migrants contributed more than half of the increase [NCRPB 1988: 137].

Although data on the income levels of the migrants are not available, there is considerable indirect evidence to indicate that the great majority of them are poor. The evidence consists principally in: (a) proliferation of slums and squatter colonies because of the migrants' inability to afford better housing; and (b) increase in employment in the informal sector in which wages/earnings are low.

Work Participation Rate

The work participation rate (main workers only) in Delhi was 31.4 per cent in 1991 (Table 3). It was lower than the national average of 34.2 per cent but higher than the proportions in the adjoining states of Punjab (29.9 per cent), Haryana (28.1 per cent) and UP (29.7 per cent) [Registrar General and Census Commissioner 1991b:12]. In all these states, the WPRs are low because of the low proportion of workers among females: the proportion for males, 51.6 per cent in Delhi and in the 47 to 53 per cent range in the adjoining states, are close to the national average of 50.6 per cent.

Data on the distribution of the workforce by industrial categories in 1991 are given in Table 4. It will be seen that the proportion of workers engaged in agricultural and allied activities was only 3.4 per cent and the remaining 96.6 per cent of the workers were engaged in various non-agricultural activities, of which manufacturing and processing including household industry (29 per cent), trade and commerce (21 per cent) and other services (31 per cent) were the most important. This may be expected since Delhi is predominantly urban. RP aims to deflect a total population of 2 million from Delhi to the DMA towns and priority town complexes by 2001. But, as indicated by the data presented in Table 5, the deflection would not alter significantly the distribution of workers by industrial categories. In other words, even after the deflection Delhi would remain a major industrial, commercial and financial centre with about half of the workforce engaged in these activities. It will be noticed also from this table that between 1951 and 1981 the proportion of the workforce engaged in manufacturing increased steadily from 17 to 29.2 per cent. The increase was almost exclusively at the expense of 'other services', which includes public administration. A reversal to the position of 1951 is not expected, however, as a result of deflection of the population. The principal reason for this is that growth of manufacturing industries in the DMA and priority towns would be due to the location of new industrial units in them and not to shifting of the units now located in Delhi. The shift, if it does take place, would only be in the case of non-conforming industries. A total of 24,000 industrial units need to be relocated [DDA 1990:185]. Shifting of markets would also not reduce the proportion of workers engaged in trade and commerce because except for the market for fruit and vegetables, which is proposed to be shifted from Azadpur in the union territory to the new town of Kundli proposed to be built in Haryana, the shifts would be from their present crowded locations within old Delhi (Shahjahanabad and Paharganj) to new locations on the periphery of DUA.

III
Comparison of MPD-II and NCR (RP)

Both MPD-II and RP have the same termination date, 2001. The principal object of both plans is to reduce the growth of economic activities and of population in the DUA by diverting the growth to a limited extent to DMA towns but mainly to priority towns in the NCR, so that the population of the union of Delhi would be 11.2 million by the year 2001. However, the two plans have different projections of population by 2001 without the deflection. Whereas MPD-II has projected the population at 12.8 million, RP has projected it at 13.2 million.

The agreement between the two plans on the principal object, the strategy for achieving it and the termination date greatly assists in their implementation, because financial and other resources needed for their implementation can be allocated with the assurance of agreement between them. The agreement is possible because both the DDA and the NCRPB are under the ministry of urban development of the central government. But it should not be taken for granted; it could be difficult to achieve if the DDA is transferred from the central government to the government of Delhi sometime in the near future.

In both plans, targets in different sectors and subsectors are need-based and do not make any reference to requirements, either of finance and professional and managerial manpower, or of the time needed for formulation and implementation of projects and achievement of the targets. RP makes it clear that implementation plans which specify these would be prepared within its framework by the state governments and by the central ministries. This may be assumed also in case of sectors other than land development and housing for low and middle income groups, which are not within the purview of the DDA.

MPD-II is essentially a land use plan which specifies the use of land in the union territory of Delhi for residential, industrial, commercial and other uses. Secondly, it specifies in great detail the floor area ratios (FARs) for lands reserved for different uses and for residential lots of different sizes,

located along roads of different widths. It contains also a review of the implementation of MPD-I. The review brings out that in the case of most sectors the projections of needs proved to be under-estimates because growth of economic activities and of population in Delhi was higher than the projections of MPD-I. The expansion of housing and infrastructure was lower still, creating a huge deficit between needs and supplies.

The two exceptions to the latter were supplies of water and electricity in case of which the achievements were 121 and 100 per cent of the targets. However, keeping in view the persistence of shortages of both, particularly in Delhi's severe summer, MPD-II takes the view that the requirement of water was under-estimated in MPD-I and suggests a higher standard – 80 gallons per day per capita – instead of the 50 gpd adopted in MPD-I. It does not indicate, however, a higher standard for calculating the requirement of electricity. The latter is essential, however, because of explosive growth during the last three decades in the number of air-coolers, air-conditioners and various electrically operated kitchen appliances. The revised standards for both water and electricity should be accepted both by the government of the union territory and the central government and arrangements should be made to meet them.

In sharp contrast to the not too unsatisfactory achievements in respect of water and electricity, there is the dismal achievement of 35 per cent of target in case of sewerage. The principal unsewered areas are: (a) Shahjahanabad and parts of its extension into Paharganj and Karol Bagh, (b) unauthorised colonies and (c) slums. In the case of the first two, night soil and other garbage is removed by headloads. The slum dwellers squat and throw garbage in open spaces nearest to them.

It is recognised in MPD-II that some of the policies of MPD-I were unrealistic and needed to be changed. The most important policy changes recommended by it are two: (i) Permission of non-residential activities in residential premises which had been prohibited in MPD-I. The change had to be made because of the high prevalence of mixed land use not only in old Delhi but also in most of the residential colonies that have come up since 1961.

(ii) Significantly higher FARs than those in MPD-I. This change has been made keeping in view the high price of land in Delhi and the consequent pressures for adoption of higher FARs. Both changes have contributed, however, to the increase in congestion, high levels of pollution of water and air, and shortage of basic services in DUA.

The review fails to mention the change in the role of the DDA from an organisation concerned primarily with formulation, overseeing implementation and enforcement of master plans, to one concerned primarily with land development and construction of houses for middle and high income groups and tenements for the low income group (LIG). During the course of the two decades 1970-90, the DDA has become the largest land development and construction organisation in India.

There were three reasons for the transformation: (a) the decision of the government of the union territory of Delhi to freeze all land within Delhi to ensure land development and construction of housing according to MPD-I; (b) the acute shortage of housing in Delhi due to rapid growth of its population; and (c) the need to resettle tens of thousands of poor residents of slums and squatter colonies.

One disturbing finding of the review of implementation of MPD-I is lack of progress in shifting of non-conforming (highly polluting and hazardous) industrial units or of markets from their old locations to new ones that had been recommended in MPD-I. On the contrary, new units have come up within the high density residential areas of the DUA, both during the period of MPD-I and thereafter. The location of polluting industries contributes to the pollution of air and water. Metallic effluents such as mercury and nickel from industries such as electroplating pollute water for long stretches of the Yamuna, thus affecting the quality of drinking water available to communities located downstream of Delhi. The presence of hazardous industries is an immediate threat to life and limb of their workers and those living in their neighbourhood. There are frequent reports of accidents in such industrial units causing deaths or injuries to workers and neighbours. As mentioned earlier it has been estimated in MPD-II that 24,000 non-conforming industrial units need to be shifted.

Some of the reasons for continuation of the non-conforming industries in their present locations have been mentioned by Mehra in his study of Shahjahanabad [Mehra 1991, Chapter 4]. However, a fuller investigation covering the entire DUA is

needed as a first step towards preparation of an effective plan for shifting the industries; it should include both financial incentives for, and administrative sanctions against, shifting.

IV
Implementation of Plans

Regional Plan NCR 2001

During the first five years (1989-93) of RP the principal activities of the NCRPB have been the following:

(i) preparation of a financial plan for the period of the eighth five-year plan 1992-97;

(ii) co-ordinating land development and other development activities within the NCR with the governments of the participating states in order to ensure that they are in accord with the strategy and policies of RP; and

(iii) serving as the nodal agency for preparation of projects included in RP. This includes attracting external financial and technical assistance for formulation and implementation of projects.

The financial plan envisages a total investment of Rs 38.13 billion. Its distribution by states and central sectors is as follows:

States' sector – Rs 19.67 billion

Central sector – Rs 18.46 billion

Investment in the states' sector will be primarily for building eight 'priority town complexes' for industrial, commercial, public administration and residential uses alongside selected priority towns. The complexes will be the growth points within the NCR to which a total population of two million would be deflected from Delhi. A sum of Rs 2 billion has been allocated by the Planning Commission for the NCRPB for the Eighth Plan period. It, together with internally generated funds of Rs 500 million, will provide seed money for building the complexes. The remaining funds are expected to be provided by public financial institutions such as the Housing and Urban Development Corporation (HUDCO), Unit Trust of India (UTI), the Life Insurance Corporation (LIC) and the General Insurance Corporation (GIC), the state governments, the private sector and bilateral and multilateral aid agencies. Investment by the state governments will match the loans advanced to them by the NCRPB. The financial plan states,

> The townships to be developed should be centred around core economic activities in the manufacturing, commercial or public administrative sectors. Industries, markets and office complexes would be shifted from Delhi as part of the overall dispersal strategy, or else developed as green-field projects of the state/central governments. Higher order social facilities of regional or national importance such as educational/medical/engineering institutions, universities, hospitals, sports complexes, tourist centres may also be among the activities to be promoted in these townships [NCRPB 1992, ii:3-4].

Investment in the central sector will be primarily for expansion/improvement of regional infrastructure such as construction of expressways, broadening and improvement of the railway lines by conversion from metre gauge to broad gauge and single track to double track and expansion/improvement of telecommunication facilities.

assistance from aid agencies would be sought for implementation of some of the projects...

The NCRPB will set up a captive financial institution called the National Capital Region Development Finance Corporation (NCRDFC) under the Companies Act, 1956. This institution will act as the apex authority to raise additional resources through market borrowing and loans from various public financial institutions. It may also invite equity support from participating states and their agencies. It will thus be the nodal financial institution for the large-scale town development projects envisaged in the NCR investment programme...

Furthermore, the NCRPB will promote joint stock companies for development of the new townships. Fifty-one per cent of the equity in the companies would be by the participating states, the NCRPB and the public financial institutions; while the remaining 49 per cent may be left for private sector investment. A certain portion of the share capital would be reserved for those whose lands are acquired for development of such projects.

Each participating state government may create a revolving fund with the seed money provided by the board (through NCRDFC) and the respective states, on a matching basis, for developing the new townships. The surpluses generated by the projects should be credited into this fund for further development [based on information in NCRPB 1992, II:5-6].

Details of progress in building the priority town complexes as also of the role of the NCRPB in co-ordinating various developments by the participating governments and serving as a nodal agency for attracting external assistance are given in the appendix. It may be mentioned that the development of priority town complexes is most advanced in Bhiwadi and Alwar (Matsya Industrial Area) in Rajasthan, Panipat in Haryana and Meerut in UP. The two Rajasthan complexes are being developed for the location of new industries, while Meerut and Panipat will begin with shifting established industries from their present congested locations within the cities to industrial estates developed outside them.

Strategy of RP

The stated strategy of RP is to allow limited growth of population in the DMA towns and to divert the growth principally to the priority towns. The strategy is aimed at achieving balanced development of the NCR and reducing pressures on the infrastructure and natural resources, particularly water, of the DMA. The strategy is not reflected, however, in the populations assigned in RP for various towns for 2001. The figures for this year, given in Table 6, indicate that all the DMA and priority towns, except Faridabad-Ballabhgarh and Meerut, would experience rapid growth during the 1990s. Such growth is envisaged for both new industrial-residential townships, such as Dharu Heda in Haryana and Bhiwadi in Rajasthan, and for old towns, such as Palwal and Rewari in Haryana and Khurja in UP, which experienced slow growth during the previous decades. This author is of the view that the populations assigned for 2001 are too high for two-thirds (11 out of 17) of the DMA and priority towns. The shortfalls would be particularly large in Palwal, Rewari and Khurja. This is because most of the projects relating to building of priority town complexes and expansion/improvement of regional infrastructure are still being prepared. After their preparation, there would be gestation periods of two to four years during which the projects would be evaluated, revised, approved and allocated the finance and manpower needed for implementation. The institutional structures needed for implementation of the projects would also be built during this period. Consequently, most of the projects would begin to be implemented only during the latter part of the 1990s. Building of priority town complexes near the selected priority towns, which is the principal project for shifting of industrial and commercial activities from Delhi, could extend well into the next decade, 2001-2011. The effects of the projects in terms of growth of economic activities and population would also be felt in this decade or later.

This is the principal reason for the recommendation made in Section VII that the period of RP should be extended by 11 years to 2012. If this recommendation is accepted, the NCRPB should prepare, in collaboration with the governments of the participating states, projections of growth of population, workforce and its distribution by industrial categories to 2011. It should prepare also new projects or second phases of earlier projects to meet the demands generated by the growth of economic activities and of population during 2001-2012.

Implementation of Second Master Plan of Delhi (MPD-II)

The nine-year period between the termination of MPD-I and beginning of MPD-II was devoted by the DDA to land development and construction of housing, mainly for MIG, and development of resettlement colonies for the LIG and EWS who were living in slums. These activities have continued under MPD-II. But while the DDA had earlier developed neighbourhoods of limited size at various locations within DUA, in recent years it has developed sizeable townships which provide housing, shopping and other facilities for tens of thousands of residents. The principal townships are Rohini in north Delhi, Patparganj in east Delhi, Vasant Kunj in south Delhi and the planned

township of Dwarka in west Delhi. As a result of the DDA's preoccupation with land development and housing, enforcement of the plan has been relegated to the background. On the other hand, the construction programme has enabled the DDA to make a major contribution to land development and construction of housing for the rapidly increasing population of DUA. During the two decades 1970/71–1990 the housing stock of Delhi increased by almost one million. Of this total, 75 per cent consisted of permanent dwelling units and the remaining 25 per cent were semi-permanent and temporary units which can also be called slum units. The DDA contributed 64 per cent or nearly two-thirds of the permanent dwelling units. Details of the type of dwelling units, the contribution of the DDA to their addition and their beneficiaries are given in Table 7.

It may be added that: (a) the real beneficiaries of many programmes have higher incomes than those indicated in the table; (b) despite the large scale of its housing activities, the DDA has made no attempt to modernise construction techniques; (c) the allottees of flats or tenements built by the DDA have to spend considerable amounts of money to make them suitable for living; and (d) there is little room in the flats or tenements for increasing living space for meeting the needs of increase in size of the family.

The DDA constructed a total of 2,35,000 dwelling units for the low income groups in its various resettlement colonies. The number of units completed was the highest during 1971-81 and within it during the three years of the emergency, 1975-77, when tens of thousands of slum dwellers were evicted from their slum dwellings and resettled in colonies developed for them. The rate of resettlement has been slower after this period for three reasons:

(i) change in priority in national planning from slum clearance and resettlement to slum improvement;

(ii) the memory of the unpleasant and disruptive experience of slum clearance and resettlement during the emergency. It should be mentioned that much force was used to evict and resettle the slum dwellers in the colonies built for them. Not enough attention was paid to the genuine difficulties of those being resettled. The resettlement colonies were located at long distances from their former places of living and work. Access roads from the colonies to the city and bus and other transport services also were not developed. Furthermore, physical and social infrastructure within the colonies was also underdeveloped. As a result, they had to face much difficulty in day-to-day living and in travelling from their homes to their jobs.

(iii) influence of vested interests (slum lords, underworld dons and others) who are interested in continuation and proliferation of slums. The slum dwellers provide tidy, steady income to the slum lords. For the underworld.dons, the slums constitute safe havens for illegal activities. For politicians, the slum dwellers are vote banks. Many slum dwellers themselves contribute to expansion of their slums by increasing the size of their huts or building new ones. Thus, they would rent out a part of their hut to a migrant or another person who is in need and use the cash and other savings to add to their dwelling or construct a new one next to it.

Freezing of land within the union territory of Delhi has made a major contribution to effective implementation of MPD-I and MPD-II. It has enabled the DDA to acquire and develop large areas for housing and for construction of industrial, commercial and community service centres as envisaged in the plan. Large colonies have been developed by co-operative group housing societies or by the construction wing of the DDA itself which provide residential accommodation to tens of thousands of people of various income groups. Furthermore, it has enabled the DDA to reserve large green areas between its flats within the colonies and also to develop parks at the district level. Without it, the green areas would have been much smaller and congestion and pollution within them much higher than at present. In most of the colonies developed by commercial developers during the 1950s and 1960s, the green areas are much smaller and roads and other circulation areas are narrower than in the colonies developed by the DDA.

The freezing of land is not regarded by DDA officials as a significant factor in the steep increase in the prices of land in Delhi. The principal reasons for it according to them are: (a) rising cost of land acquisition and development, and (b) speculation in land.

Reform of DDA

The first major step towards structural reform of the DDA was taken in September 1992 when its slum improvement and resettlement wing was transferred to the municipal corporation of Delhi (MCD). A decision to transfer construction of dwelling units on lands developed and sold by the DDA to co-operative group housing societies, private developers and individual owners had been taken as far back as 1987, but it has yet to be implemented. It is expected, however, that the DDA's construction programme will be wound down progressively as projects in progress are completed. Thereafter a small unit could continue for some years to remove structural and other defects in the dwelling units built and sold by the DDA.

With these changes the DDA will be a leaner and, hopefully, more efficient organisation concerned principally with acquisition, development and sale of land, and formulation and implementation (including enforcement) of master plans.

It remains to be seen whether the transfer will be of benefit to the slum dwellers. There are two main reasons for the doubt. First, the MCD is a very large, almost unwieldy organisation, and since slum improvement and relocation of squatters would be one among its numerous functions, it is possible that adequate attention is not paid to it. Second, as two recent statements issued by it to the press, extracts from which are given below, indicate, its policy on slums and squatters is still being evolved:

> Conferment of ownership rights on nearly one million residents of 2,50,000 hutments located in 44 colonies, which were established during the years of the Emergency (1975 to 1977), by relocation of slums located within the then DUA. Two-thirds (31) of the colonies are located in east and west Delhi; the rest are in various other locations. The hutments are built on plots of 25 sq yards each. The properties would be given on lease but can be converted into free-hold by paying a fee to the MCD. MCD will charge the prevailing market rate for the conversion which would not exceed Rs 900 per sq yard of land that the DDA has been charging. It proposes to raise Rs 1 billion from the sale of the properties [*The Times of India*, June 4, 1993].
>
> Development of 14 special squatting zones located on the urban fringe, mainly in north and west Delhi, for resettlement of about 1,00,000 people who have moved into Delhi after 1990. In each zone, a plot measuring 10 sq mt would be allotted to a household. MCD will provide basic services to ensure clean living but only 'kutcha' (mud and thatch or corrugated iron sheet) structures would be allowed to be constructed. Furthermore, contractors would be employed to collect all dues from the households. The object of the scheme is to release valuable vacant lands that are likely to be encroached upon by the ever-expanding unauthorised colonies [*The Times of India*, June 7, 1993].

The proposals have been sent for approval to the ministry of urban development. They could be rejected. The second proposal could be vigorously opposed by the slum dwellers for three reasons.

(i) The squatting zones would be at long distances from places of work of those being relocated so that they would have to undertake long, time-consuming and expensive journeys between their homes and places of work.

(ii) Allowing construction of only kutcha structures, which are liable to be burnt in Delhi's hot summer or suffer severe damage during dust for thunderstorms, on plots as small as 10 sq mt, would result only in creation of planned slums.

(iii) Employment of contractors to collect dues from the slum dwellers for services provided by the MCD would give it the income projected only if there is effective supervision of the contractors. Otherwise, it would lead to exploitation of the residents, besides poor receipts to MCD due to leakages.

The only merit of the proposal is that it would send a signal to would-be migrants to Delhi that they would be treated much less generously than the migrants of earlier years have been treated. The long-term solution to the problem of squatting in Delhi, however, is to deflect employment from it to the DMA and priority town complexes (and sub-regional centres), as has been recommended in RP. This is because:

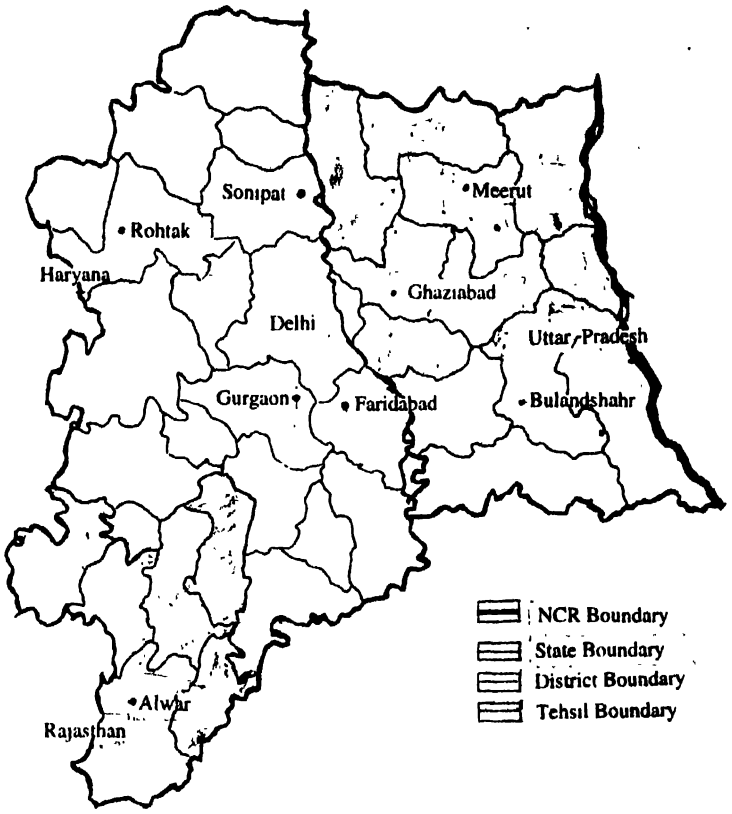
> The principal reason for migration into Delhi in the last three decades is rapid increase in employment in new industries, especially small-scale, and expansion of trade and commerce. 'Employment' and 'family movement' accounted for 73 per cent of all the migrants in 1981 from the five adjoining states [NCRPB 1988, I:15].

VI
Prospect for 1991-2001

The principal features of the prospect for the decade 1991-2001 can be summarised as follows:

(i) *Growth of population.*

The total population of the DUA would not be much less than the 13.2 million projected by the NCRPB; it could even exceed the figure and reach 14 million since most of the villages, which are semi-urban already, could be reclassified as urban. Many of them would become part of the DUA as a result of its rapid spatial expansion. The principal reason for not expecting any deflection of the population to the DMA and priority towns is that most of the projects for achieving the deflection would bear fruit only during the decade 2001-2011.



(ii) *Delhi will remain a major industrial centre.*

The proportion of its workforce engaged in manufacturing industries would not only not decrease but could increase. The principal reason for this is that the government of the union territory which was elected in December 1993 is not interested in shifting industries from Delhi to the priority towns/ cities in the NCR. On the contrary, it is interested in encouraging further growth of industries and relaxing anti-pollution control over them.

(iii) *Proliferation of slums and unauthorised colonies.*

Because of continuing increase in jobs in the industrial and service sectors, large-scale migration into Delhi will continue, with most of the migrants being poor.

FIGURE: NCR CONSTITUENT AREAS

Furthermore, the government of the union territory has promised to provide all slumdwellers with electricity connections and to regularise all the unauthorised colonies, numbering about 600, which had existed on March 31, 1993 [*The Times of India*, December 14, 1993, pp 1, 13].

(iv) *Pollution of air and water and traffic congestion.*

Pollution will worsen greatly because of: (a) continuing growth of manufacturing industries, and (b) rapid increase in the number of motor vehicles: "According to surveys conducted by the Central Pollution Control Board and the Indian Institute of Petroleum, Delhi tops in pollution among the five metropolitan cities; it is followed by Bombay, Bangalore, Calcutta and Ahmedabad in that order. Motor vehicles discharge 870 tonnes of pollutant in Delhi compared with 550 tonnes in Bombay and between 245 and 255 tonnes in Calcutta, Bangalore and Ahmedabad" [*The Times of India*, September 13, 1993: Capital I].

The principal emissions are carbon monoxide, hydrocarbons, oxides of nitrogen and lead compounds which are injurious to the health of both human beings and animals. Emissions from motor vehicles contributed 50 to 60 per cent of the air pollution. The number of motor vehicles, 70 per cent of which are two- and three-wheelers, increased three-and-a-half times during the seven years 1984-89 (Table 8), and the rate of annual increase may be expected to be similar during the decade 1991-2001. The increase in pollution would lead to rapid increase in the incidence of respiratory diseases, such as asthma, among children.

Construction of a mass road transport system (MRTS) could reduce growth in the number of vehicles. But the cost of the system estimated at Rs 90 billion according to the latest study conducted by RITES, is so high that a central government which is committed to reducing budgetary deficits, would not finance it. It would involve massive investment and the rate of return on it would probably be negative because of the need for subsidising its operation. Fares for travel on the system would need to be kept low because most of the travellers would belong to low and medium income groups.

(v) *Increase in shortage of water and electricity.*

The present shortages will worsen unless supplies are increased adequately and in time to meet increasing demands. The shortage of water could be overcome by obtaining larger supplies from UP, Haryana

and Punjab. To overcome the shortage of electricity, facilities for generation, transmission and distribution will need to be greatly expanded. The central government could be expected to finance projects for expansion of water supplies, but those relating to electricity would need to be financed largely through market borrowing by the Delhi Electricity Supply Undertaking (DESU), which is proposed to be privatised. It may be added that as a result of poor operational and financial management, which includes large-scale pilferage of electricity, poor maintenance of facilities, low electricity rates and lack of a proper system of accounting, DESU incurs large losses every year in its operation. A number of steps are being taken to reduce the losses and make the undertaking financially viable before it is privatised.

(vi) *Ribbon development along roads.*

Particularly the Delhi-Gurgaon-Dharu Heda and Delhi-Faridabad roads could be completely lined with housing colonies, small and medium sized industrial units, repair shops and storage facilities of companies based in Delhi and housing colonies. The Delhi-Ghaziabad-Meerut road is lined already and construction of a six-lane expressway to divert traffic from it is included in the transport component of RP.

VII
Recommendations

These recommendations are aimed at making planning for Delhi and the NCR more effective. They focus, therefore, on improving the planning functions of the DDA and the NCRPB and strengthening co-ordination between them. They begin with the DDA, whose original functions of formulation and overseeing implementation of long-term development plans for Delhi have become marginal to its main activity of land development and construction of housing for LIG and MIG and resettlement of slumdwellers. The two functions take, according to a senior official of the DDA, almost all its resources of finance and management. Furthermore, most of its top officials are constantly engaged in fire fighting operations related to the above-mentioned functions. Keeping this in view, the author reiterates the proposal for division of the DDA into the following three autonomous or semi-autonomous agencies:
(i) Delhi land development and housing board,
(ii) Delhi board of slums and squatter colonies, and
(iii) Delhi planning authority.

(i) *Delhi land development and housing board.*

The board should have responsibility for land development and construction of flats for the middle income group. Construction of houses/flats for people of the high income group on land developed by the DDA should be left to co-operative group housing societies (CGHS) or to individuals. The board should have a strong consultancy organisation in order to improve quality and reduce costs of land development and construction. These will greatly reduce the innumerable complaints by purchashers of the flats built by the DDA about their poor quality including structural defects. Furthermore, keeping in view Delhi's climate, especially its long hot summers and familial and social life of the residents, it should keep even larger green spaces between buildings than it does at present.

(ii) *Delhi board for slums and squatter colonies*

The board should have three main functions:
(a) improvement of slums and squatter colonies which have acceptable locations by improving sanitation in them and providing essential physical and social infrastructure (access roads, filtered water, surface drains, electricity, primary schools, health centres, etc). The layout of the colonies should also be modified to the extent possible within the constraint of their present location. Confirmation of secure tenure on the residents/owners would provide them a strong incentive for self-help in improvement of the dwellings.
(b) shifting residents of slums and squatter colonies that have unacceptable locations, such as along pavements of roads, lands reserved for location of public facilities – educational institutions, health centres, parks or other recreation facilities – or poorly drained lands, which are liable to floods during the monsoon and have pools of stagnant water through most of the year. The resettlement colonies should be as close as possible to the former dwellings of the residents so that they face minimum dislocation in their lives and do not have to travel long distances between their new homes and places of work.
(c) providing site-and-service and core housing to the people who are being resettled. The cost of land development and providing core housing would undoubtedly need to be subsidised, but emphasis should be on self-help by the residents. The resettlement colonies should be properly laid out and provided with basic service facilities. Individual plots within them should not be smaller than the present approximate 21 sq mt for those who can can pay a part of the costs of land development and construction of core housing. It may be added that their number would not be small since the costs would have to be paid in instalments extending over a period of 15-20 years.

Both the Land Development and Housing Board and the Board for Slum and Squatter Colonies should establish strong relationships with public financial institutions such as the Housing and Urban Development Corporation (HUDCO), the Life Insurance Corporation (LIC) and the General Insurance Corporation (GIC) in order to raise funds for their land development and construction programmes. They should also establish appropriate relationships with carefully selected non-governmental organisations (NGOs) in order to obtain their co-operation in resettlement of residents of slums and squatter colonies. The NGOs can play a valuable role also in maximising self-help by the residents of resettlement colonies, promoting self-management of the colonies, and undertaking community development programmes.

(iii) *Delhi planning authority.*

The authority should concentrate on formulation, overseeing implementation of development plans and making periodic adjustments in them in the light of changing conditions. The concentration will avoid repetition of the hiatus of almost a decade between the termination of MPD-I and beginning of MPD-II. During the currency of the latter, it should have three principal functions:
(a) ensuring that deviations from or violation of the plan, including those by MCD, the government of the union territory of Delhi or of the central government are minimal;
(b) ensuring that projects for expansion/improvement of physical and social infrastructure are prepared by the concerned authorities well in time for implementation within the plan period. This will provide adequate time for approval and start of the projects and minimise shortfalls between needs and achievements; and
(c) ensuring that work on formulation of the Third Master Plan for Delhi (MPD-III) begins three years before termination of MPD-II so that it is ready for implementation, after making the changes needed in it to meet objections of the public and suggestions from the approving and financing agencies.

Finally, the DDA should include in both MPD-II and MPD-III provisions for reserving adequate and well-located lands for construction of site-and-service and core housing for the urban poor. This is essential to reduce the mushrooming of slums and squatter colonies as a result of influx of tens of thousands of poor migrants into Delhi.

Four other organisational reforms are worthy of serious consideration by the central government and the government of the union territory of Delhi. These relate to:
(i) Decentralisation of the MCD;
(ii) Constitution of a strong and effective anti-pollution board;

(iii) Autonomy for the Delhi Water and Sewerage Board (DWSB), and
(iv) Implementation of the decision to privatise the Delhi Electricity Supply Undertaking (DESU).

(i) *Decentralisation of the MCD.*

The MCD does not have the management resources to provide efficiently essential services to a metropolis with a population of more than 9 million and which stretches by long distances in all directions. As a result, there is much inefficiency and corruption in all its departments. Its function of assessment and collection of taxes, of which property tax is by far the most important, has already been decentralised to some extent; it is performed by zonal offices of the MCD. However, the jurisdiction of individual zonal office is too large and should be reduced by increasing the number of offices. A time-bound programme should be drawn up for decentralising delivery of essential services by the zonal offices. In residential colonies, industrial estates and markets where there are welfare associations of residents/industrialists/merchants, their active co-operation should be obtained for delivery of services as well as in assessment and collection of taxes. Their co-operation would lighten the burden of the MCD officials and increase efficiency in delivery of services. Teams of high level officials should be constituted to advise and audit to check leakages of revenues by mismanagement or by collusion between officials of the MCD and office-bearers of the associations. Details of the proposal should be worked out by a team of MCD officials and selected representatives of welfare associations.

(ii) *Anti-pollution board.*

References have been made in earlier sections to the very high and rapidly increasing levels of air and water pollution in Delhi. However, apart from some symbolic gestures, such as measuring the level of pollution in exhausts of private cars, taxis and two- or three-wheelers, no action has been taken in this area. Similarly, apart from treatment of a larger proportion of the sewerage flowing into the Yamuna, little progress has been made in reducing water pollution. Effective measures to counter the ongoing and foreseeable future trends can only be undertaken by a strong anti-pollution board. The board should have the support of both the central government and the government of the union territory of Delhi so that it can resist strong pressures against anti-pollution measures to be undertaken by it. The pressures would come from associations of dealers of motor vehicles; owners/managers of polluting industries, chambers of commerce and industry, and similar bodies.

In order to reduce pollution of water the board must insist on relocation of non-conforming industries and complete treatment of the sewerage being discharged into the Yamuna within a specified time period. The project for clean-up of the Yamuna, which forms part of the Ganga clean-up project, should be expedited. It may be added that the Yamuna is considered to be the most polluted river in the country.

For reducing air pollution, Delhi should have a mass transit system (MRTS) supported by a largely privatised and efficiently operated bus service. Since construction of the MRTC cannot be financed by the central government, it should be built and operated by a private company. The government will need, however, to subsidise its operation because fares on it have to be kept low enough to be within reach of the commuters, most of whom would be of the low income group.

(iii) *Delhi water and sewerage board (DWSB).*

The board should not remain under control of the MCD but should be made autonomous. The change in status will allow the board to concentrate its attention on improving efficiency and effecting economy in its operation. It would also have greater freedom in adjustment of rates for the services provided by it. The rates would not be economic because of the need for rendering services to the poor residents of DUA at subsidised rates. However, the level of subsidy could be reduced by suitable increases in rates for consumers of the high income group and for commercial and industrial users.

(iv) *Privatisation of DESU.*

The central government has already decided to privatise DESU as a possible solution to Delhi's chronic problem of shortage of power, particularly in the summer, when there are frequent and prolonged power cuts. The experiences of other cities such as Bombay and Ahmedabad indicated that private companies are better equipped to supply electricity to megacities than are public enterprises. The NCRPB has recommended three measures to reduce the power deficit:
(a) increase in tariff;
(b) deterrent charges for misuse and pilferage; and
(c) large allocation of power from the central reserve of the northern grid to Delhi and to the DMA and priority towns in the NCR.

To reduce the shortage of water in Delhi and the NCR, the board has recommended expeditious execution of projects. It has also recommended that an agreement on sharing of Yamuna water among Delhi, Haryana and UP be finalised [*The Times of India*, July 1, 1993, Capital 2].

(v) *Urban renewal: preventing emergence of decaying city syndrome.*

There is urgent need for a well-designed urban renewal programme for Shahjahanabad and its extensions to Paharganj and Karolbagh. The programme for Shahjahanabad should have three principal components:
(a) Renovation of buildings and streets of historical and cultural importance.

The buildings would include residences of eminent Urdu poets such as Mirza Ghalib, Haali and Zauk and 'havelis' (palaces) of nobles which can be restored to their original form without excessive cost. The streets would include Chandni Chowk and 'katras' which specialise in production and sale of traditional artistic handicrafts of Delhi such as jewellery, fine silk, 'zari' work and ivory work. The original facades of the renovated buildings and layout of the streets should be maintained as much as possible. In case of Chandni Chowk, in particular, the pedestrian arcades on both sides of the street should be renovated and the central canal with fountains playing in it should be restored. Most of the katras should be made exclusive pedestrian streets, as is done in old sections of many medieval European cities. This will add to their charm and reduce congestion and pollution in them. The need for transport of goods produced in them could be met by non-motorised vehicles such as bicycle rickshaws.
(b) Removal of non-conforming (highly polluting and hazardous) industries and congested markets to more suitable locations.

The non-conforming industries should be shifted to various rural locations within the NCR, but most of the markets can be shifted to suitable locations on the periphery of the DUA itself or at some distance from it. Thus, the markets for electrical goods and bicycles, located within Shahjahanabad at present, could be shifted to one or more appropriate locations on the periphery of DUA. The most suitable location for the market for meat and poultry products would, however, be the new town of Kundli, which is going to have a large market for fruit and vegetables. The new locations should be selected by associations of traders or industrial entrepreneurs themselves, which will reduce resistance to the relocations. But both fiscal incentives and adminstrative sanctions would be needed to overcome the remaining resistance. After the relocations it will be possible to improve access to and circulation within the areas by widening of roads and streets. Furthermore, the relocated entrepreneurs and traders can expand and diversify their operations in the new locations. Thus, traders in bicycles could add trading in scooters, mopeds and motor cycles. The areas vacated by shifting non-conforming industries or markets should be

utilised for housing of workers in the remaining commercial and handicraft establishments, for parking of motor vehicles or for recreation.

(c) Provision of sewerage in the unsewered areas.

The urban renewal programme for Paharganj and Karolbagh should be designed so as to meet their particular needs and problems. The few buildings of some historical importance, such as the Tibbia college in Karolbagh should be restored to their original form. However, the principal emphasis in these areas should be on relocation of non-conforming industries and congested markets. The areas vacated by the relocated industries and markets should be used for parks and widening of roads to improve the circulation of vehicles. A few high-rise buildings could be allowed to be built to provide housing for those who were living earlier in congested, decaying single storey structures. A suitable package consisting of both financial incentives and administrative sanctions would need to be evolved to effect the relocations.

An imaginatively designed urban renewal programme would prevent emergence of the 'decaying central city syndrome' which has appeared in many American cities. Shahjahanabad, in particular, could become an attractive place to live for affluent and middle-income residents, and for visits by Indian and foreign tourists.

Appendix

Development of Industrial and/or Commercial Complexes alongside Priority or DMA Towns

PRIORITY TOWNS/COMPLEXES

Rajasthan

1 Alwar

Alwar is an old city located about 160 km south of Delhi. It was the capital of a small princely state of the same name before accession of the state to India. It is now a district headquarters besides being a market town for its surrounding villages. Its population increased by about 45 per cent in each of the two decades 1971-81 and 1981-91. But much a faster growth of 137 per cent is expected during the current decade because of the Matsya Industrial Areas (MIA) located along the Alwar-Delhi road about two km from Alwar city. The multi-industry complex with a large number of medium- and large-scale industries for the regional (Delhi, Haryana, northern Rajasthan and south-western UP) markets is coming up rapidly. With the investment proposals that the Rajasthan Industrial Investment Corporation (RIICO) has received, a total of 30,000 jobs would be created in the MIA. The number would be doubled to 60,000 even on a conservative estimate of one industrial job triggering one service sector job. Further assuming five members per worker household, an additional population of 300,000 can be expected.

Rajasthan-Haryana

2 Bhiwadi-Dharu Hera

Multi-industry complexes, already established in both townships, are growing rapidly. They had a population of 26,000 in 1991 which is projected to increase to approximately 1,90,000 by 2001 (Table 6). The long-term (beyond 2001) projection of population is 4,50,000 (Bhiwadi 30,000, Daru Hera 1,50,000). There is healthy competition between the governments of the two states in development of the complexes. Bhiwadi is being promoted by RIICO, which has established a single window facility for entrepreneurs wishing to establish industrial units in it. In Dharu Hera, the industrialists had to make their own arrangements for land acquisition and development, loans, permits for supplies of inputs, etc. until recently, but they are now being actively assisted by the Department of industries and other agencies of the Haryana government.

The advantages of the complexes are (i) location about 60 km from Delhi along or near the national highway which connects Delhi with Jaipur, (ii) level, well-drained land which can be developed without excessive cost, (iii) adequate supplies of electricity and water of good quality; and (iv) little pollution. Since most of the industries are non-polluting, a serious pollution problem is not expected.

Principal needs are (i) Educational and medical facilities including a college and a district level hospital, (ii) efficient telecommunications, (iii) lower cost facilities for transport of goods, by rail and road; and (iv) expansion of housing in step with the increase in population. Because of shortage of housing and of appropriate educational or health care facilities, most of the owners/managers, other professionals and a large proportion of the skilled workers in the industrial units live in Delhi and commute to the townships from the city. A proportion of the unskilled workers come from neighbouring villages but most of them are migrants from other states – UP, Bihar and Kerala. The predominance of migrant workers is due to the limited supply of labour in the neighbouring villages. The migrants live in small one-room tenements, built by individual landlords, which are crowded and lack sanitary facilities.

Haryana

3 Rewari

A stagnant town for a long period, Rewari is showing signs of growth through modernisation of its old brass utensil making industry and establishment of new industries. Its growth will receive a stimulus because of its strategic position as a junction station on the railway line along which goods traffic will flow from the southern and western states of India to Haryana, Punjab, Jammu and Kashmir and Himachal Pradesh. In order to overcome the town's serious problem of shortage of water, the Haryana government has formulated a proposal for obtaining water for it from the Jawaharlal Nehru canal, which is expected to be operational in about four years.

4 Palwal

Another small, long stagnant town with potential for more rapid growth after some years, if an inland container depot (ICD) which is being proposed by the ministry of railways is constructed. Furthermore, it will be the starting point of the broad gauge railway line that will by-pass Delhi to go west-north-west through Rewari, Rohtak and Panipat to Punjab, Haryana, Jammu and Kashmir and Himachal Pradesh, and east-north-east through Khurja, Bulandshahr and Hapur to Meerut, Muzaffarnagar and Dehradun in UP. Construction of the railway is an important component of the transport component of RP.

5 Panipat

A rapidly growing commercial-cum-industrial city located about 80 km north of Delhi along the road from Amritsar to Delhi. Its population which was only 88,000 in 1971 increased rapidly during the next two decades to reach 1,91,000 in 1991. Its economic bases are:

(i) manufacture of furnishings by handlooms and powerlooms for consumption within India and for export, and

(ii) markets in wool and agricultural produce. RP has assigned a population of 5,00,000 for it in 2001. This is unrealistic, however, because the growth rate of the population during 1991-2001 is not expected to be much higher than the 38.5 per cent experienced during 1981-91. Assuming a growth rate of 40 per cent during the decade, the population would be 2,87,400 by 2001. RP includes a proposal for construction of a six-lane expressway between Panipat and Sonepat in order to improve road communications with Delhi. Meanwhile, NCRPB financed during the Seventh Plan period development of a transport nagar, which provides facilities for parking of trucks and board and lodging for drivers. Its increasing need for electricity would be met adequately after completion of a large generating station which is being built near it. Its other needs are for efficient telecommunications with Delhi and increased water supply. Land development for residential, commercial and industrial

expansion is being undertaken by the Haryana Urban Development Authority (HUDA), primarily on a self-financing basis.

6 Rohtak

Rohtak is a medium-sized city with population of 2,16,000 in 1991, located about 60 km west of Delhi. Essentially a 'mandi' town, it has become an important educational centre with location in it of the Maharishi Dayanand multi-faculty university and several colleges. RP envisages a population of 5,00,000 for it by 2001. The target is quite unrealistic, however, in view of the slow growth of its population during the previous two decades – 29.4 per cent during 1981-91 and 33.7 per cent during 1971-81. RP's projection of population was based on the building of a complex in the vicinity of the city in which a large number of small- and medium-sized industrial units in agro-based industries, textiles and metalware would be located. But the statewide shortage of power and water is a serious constraint on development of the complex. In addition, Rohtak lacks adequate surface drainage and sewerage. All these constraints need to be removed before rapid growth can be achieved. The shortage of water would be met by the construction of the Jawaharlal Nehru Canal; the shortage of power would be alleviated with supply from the generating station located near Panipat.

Uttar Pradesh

7 Bulandshahr-Khurja

Bulandshahr, located about 40 km east of Delhi, is the headquarters of a district of the same name and a market for its surrounding villages.

Khurja, located further east, has besides its foodgrains market, an old pottery industry. The latter, which had concentrated on production of crude low-priced products until recently, is now undergoing rapid modernisation. It is producing higher quality products, a significant proportion of which are exported.

Development of multi-industry complexes and expansion of the existing foodgrains markets are envisaged for both towns.

8 Meerut

Meerut is a large city which had a population of 8,47,000 in 1991. Near doubling of its population to 1.55 million by the year 2001 is envisaged in RP. Envisaged also are: (a) modernisation and expansion of its existing handloom, sporting goods, surgical instruments and scissors-making industries, and (b) residential development for decongestion of the city and for meeting the housing needs of its growing population. Land development for a new industrial-cum-residential township, to which a proportion of the existing industrial units would be shifted, is in progress.

9 Hapur

This is the largest market for foodgrains and oilseeds in northern India. It had experienced growth of about 45 per cent in population during each of the two decades, 1971-91; but much faster growth of 169 per cent is assigned for the city during 1991-2001. This is to be achieved through the establishment of a multi-industry complex in addition to expansion of the market in foodgrains and oilseeds. The assignment is unrealistic, however, keeping in view the earlier growth rate of the population of the city.

DMA Towns

Haryana

1 Gurgaon

A rapidly growing residential-cum-industrial satellite town of Delhi. Although its population increased only from 1,04,000 in 1981 to 1,35,000 in 1991, it is experiencing very rapid growth at present. However, the population in 2001 would be much less than the 7,00,000 assigned in RP. Its principal needs are efficient and low cost road transport facilities and telecommunication links with Delhi. These will facilitate its growth as a residential-cum-industrial satellite city of Delhi and also as a retirement community.

2 Faridabad

An industrial-cum-residential city which is experiencing steady but not too rapid growth. It has only a limited function as a dormitory town for Delhi. On the contrary, a large number of skilled workers, professionals, and owners/managers of industrial units located in Faridabad live in Delhi and commute daily to and from it. The population of Faridabad increased less rapidly during 1981-91 than during the previous decade because development of the city has been over-shadowed by the rapid development of NOIDA, which has become a part of Delhi. More rapid growth is expected in future, because it would be the starting point of the Faridabad-NOIDA-Ghaziabad (FNG) expressway, which with its link to the Delhi-Meerut expressway, will provide a fast road by-pass for traffic from the southern and western states to western UP. The Asian Development Bank is undertaking a feasibility study for construction of the expressway on build, operate, collect toll (BOT) basis. The study is expected to take about one year for completion.

3 Kundli

A new market town to be built in Haryana about 10 km from the Delhi-Haryana border along the Delhi-Panipat national highway. It will accommodate the principal fruit and vegetables market of Delhi, which will be shifted to it from its present congested location at Azadpur. The proposed construction of the Sonepat-Panipat expressway will also provide a stimulus to growth of the town.

4 Bahadurgarh

This is a medium-sized town with a population of 57,200 in 1991, which had experienced growth during the two previous decades of 52.6 and 45.2 per cent, respectively. Its growth could be faster in future but it is unrealistic to expect it to attain the population of 2,00,000 by 2001 assigned in RP. RP's projection was based on shifting to Bahadurgarh almost all the non-conforming industries located in Delhi. The government of Haryana had acquired land for the shift but it is lying vacant because there is no power or water for the industries. The water problem of Bhadurgarh and other towns of Haryana would be alleviated with construction of the Jawaharlal Nehru Canal which would bring 50 cc of water from the Satluj-Yamuna link when it is completed.

UP

5 Ghaziabad

Ghaziabad is the largest and most important DNA city. Besides being a dormitory for Delhi, it is a major industrial centre. Most of the industries located in it are oriented towards meeting the demands of Delhi and the NCR for consumer, intermediate or producer goods. A large proportion of them have been started by Delhi-based entrepreneurs. Ghaziabad had a population of 5,20,000 in 1991, which had grown rapidly from 2,67,000 in 1981 and 1,37,000 in 1971; the decadal growth rates were 80.9 per cent in 1980-81 and 109.6 per cent in 1971-81. RP envisages a population of 1.1 million by 2001 at a growth rate of 111.1 per cent during 1991-2001. The projection appears to be realistic since the rapid growth of the previous two decades is continuing.

Land development in the city is carried out principally by the Ghaziabad Development Authority (GDA), which has developed a large number of residential colonies principally for the middle and higher income groups. The city experiences, however, severe shortages of power and water and lacks an efficiency functioning sewerage treatment plant. Disposal of solid wastes is also very poor. Liquid wastes, domestic and industrial, are being discharged into the Hindon river, converting it into a virtual sewer. Seepage of water from the river seriously affects the quality of drinking water pumped by tubewells. But no attention is being paid to this problem at present.

There is a proposal to overcome the shortage of water by construction of a chain

of tubewells with Tillamode dam as the source of supply and bringing 50 cc of water from the Ganga canal, but the UP government has not yet approved the proposal. The other urgent requirement of the city is an efficient sewerage treatment plant of adequate capacity.

RP includes a proposal for construction of a six-lane expressway between Meerut and Delhi, parallel to the existing Meerut-Ghaziabad road, which is lined completely with commercial, industrial and storage establishments located in a number of large and small towns and which is highly congested. Construction of the expressway will facilitate movement of traffic between Delhi and Meerut. Its linkage with the FNG expressway will enable road traffic between western UP, Haryana and points further south, which is not meant for Delhi, to bypass it.

6 NOIDA

The New Industrial Development Area is a new city located east of Delhi to which it is connected by a bridge across the river Yamuna. It has come up very rapidly during the past decade to attain a population of 1,67,000 by 1991. A population of 5,50,000 in 2001 is assigned to it in RP. The assignment is not unrealistic despite the fact that it would mean a more than three-fold increase in population. This view is based on the very rapid growth of the city during 1981-91. The Industrial Development Corpora-tion of UP had planned development of a large industrial-cum-residential complex, extending over an area of 30,000 acres (44 villages) alongside the present NOIDA. Total population on full development of the complex would have been about one million. The corporation had also planned construction of a captive unit to supply electricity to the complex and to obtain water for it from the Hindon river. However, NCRPB persuaded the UP government to decentralise the development by diverting a part of it to two sub-regional centres – Surajpur and Kasna. The decentralisation will reduce pressure on the physical and social infrastructure of Delhi. Since traffic between NOIDA and Delhi is already greater than the capacity of the four-lane road that connects them, a six-lane highway is being constructed.

The populations in 1991 of the priority and DMA towns/cities and those assigned in the RP for 2001 are given in Table 6. It may be noted that in most cases the assigned populations are too high considering the population in 1991 and its growth during the two previous decades 1971-91. The principal exceptions are Alwar, Dharu Hera-Bhiwadi, Ghaziabad and NOIDA, in all of which rapid development of medium and large industries is in progress. The NCRPB proposes to assign lower population figures for 2001 for most of the towns in its first revision of the RP to be published in 1994.

POSITIONS AT LOCOST

LOCOST is a pioneer manufacturer of essential drug formulations in the voluntary sector. All our efforts are oriented towards keeping health care accessible to especially those who cannot afford. LOCOST invites applications from motivated individuals, especially women, for the following positions:

Education Coordinator: To initiate, coordinate and implement all rational therapy related educational activities of LOCOST.

Research Coordinator: To design and implement research programmes of LOCOST especially as related to the economics and technology of drug production, use and misuse of medicines, GMP; occupational hazards in drug production and drug laws.

Publications Coordinator: To conceive, design and produce user-friendly publications resulting from our education and research efforts. To coordinate a news-feature service on health and drugs.

Applications are also invited for the positions of **Programme Associates** in education and research.

Salaries are modest but will be reasonable. All positions are Baroda based. Written competency in English and other Indian languages, especially Gujarati, desirable.

Graduates/post-graduates/doctorates in medicine, pharmacy, bio-chemistry, economics, management, and related disciplines are particularly encouraged to respond. Please contact/write: **Low Cost Standard Therapeutics**, GPO Box No. 134, Baroda-390 001.

Secularisation and Minoritisation
Limits of Heroic Thought

Dipankar Gupta

While secularism appears to be an embattled ideology at present, this is not the first time secularism is being questioned. To overcome the limitations of the secularists' 'heroic thought' one should heed the sociological distinction between secularisation as social process and secularism the ideology. The usefulness of this distinction is seen in regard to the minorities question: secularism as ideology divorced from the process of secularisation contributes to the process of minoritisation, leaving the door open for its stated enemies to function legitimately in the political system.

IN contemporary times secularism appears as an embattled ideology, no longer sanguine about its future. Though this note of despair is not entirely without foundation, it must also be said that it is not as if this is the first time that secularism is being questioned, nor will it be the last. As the fortunes of secularism are generally gauged from the success or failure of certain political parties, societies seem to go through their decennial crises every now and again. In modern Indian history there have been several occasions when it might have seemed that the secular political option was done and over with. And yet, in spite of the worst prophecies, it has miraculously managed to survive in the Indian political firmament.

The partition of 1947, which is still live in many memories, was one such occasion when secularism seemed hopelessly doomed. Many activists of the Congress, and of various left organisations, felt completely betrayed at the way some of their trusted comrades and party faithfuls had succumbed to communal passions [Gupta 1994]. Yet it is generally agreed that under Jawaharlal Nehru's stewardship, secularism successfully withstood this onslaught and went on to become the ruling credo for over two decades.

It may be objected that the terms secularism and communalism are used here in a very loose sense, but that is simply because some concessions are being made to the ways in which these words are popularly employed. Secularism contains within it a host of alternative ideological possibilities, ranging from Maoism to liberal conservatism, and likewise communalism includes sectarianism, ascriptive loyalties, racism and other such ideological dispositions.

Even with an understanding as general as this it should be easily recognised that secularism as an ideology has its good days and bad, its triumphant moments as well as its periods in the doghouse. Since secularism is understood principally as an articulated political option, the emphasis is on the mercurial swings of public mood and not on the long duration of social processes. As the heat of the ideological moment tends to overwhelm the observer, it is not at all surprising that it is this, and not the slow, prolonged grinding of social processes, that gets the main attention.

This is why the contemporary wave of communalism (and ethnicity) in India is often viewed, not as a phase, but rather as a permanent feature of our times. Naturally, despair seems so legitimate under these circumstances. Contemporary secularists must nevertheless recognise that such a position objectively implies that they have little faith in the common people to question the communal agenda. Nor can one overlook the fact that both despair and complacency are products of ahistoricism, much as contemporary secularists would like to refute such an allegation (what with so many certified historians in their ranks). Hence the secularist comes through as the last hero, tilting so gloriously at windmills.

While all this is good for the ego, there is little social science in it. It is perhaps for situations such as this that the Hungarian poet-philosopher Pettoffi was provoked to write that "despair.. is vanity". For there is a lot of vainglory that abounds amongst some contemporary secularists as if they are privileged to be living in the worst of times. The truth however is that neither secularism nor communalism are permanent fixtures, but it is not easy to get this homily across for it takes the shine off of what self confessed secularists believe is their 'heroic thought'.

Secularisation and Secularism: Process and Ideology

In order to overcome the limitations of heroic thought it would be well to heed the advice of sociologists who have always been very careful to distinguish between secularisation and secularism. For sociologists, secularisation refers to an impersonal social process the effects of which are felt at the conscious level, no doubt, but whose working largely happens behind our backs. According to Luhmann (1982:229), secularisation inaugurates a functional differentiation of the social order which frees individuals from the various kinds of stratified differentiation that prevailed in traditional societies. Consequently religion, and other forms of ascriptive ties, begin to lose their unquestioned status as systemic principles of organisation. Secularism, the ideology, is not neglected by sociology, but seen as an aspect, or as a feature of, the secularisation process. As sociology sees the two as separate, though related, phenomena, it must conceptually distinguish one from the other. Even so it needs to be clarified at the outset that secularisation allows for, and indeed even promotes, a variety of ideologies. Therefore, within the ambit of secularisation, communalism can emerge as an option as much as can secularism. Demerath and Williams conceptualise this feature in terms of a dialectical tension between sacralising and secularising (1992:190).

Likewise this paper distinguishes between secularisation as a process and secularism as an ideology, and no matter how frequently the two may appear together in history, they need to be analytically separated. There is no denying the fact that the ideology of secularism did not make its appearance before secularisation had occurred, but it is also true that not every instance of secularisation necessarily implies secularism.

From Toennies to Maine, and from Berger (1970) to Parsons (1974) to Luhmann (1982), there is little doubt that sociologists have seen secularisation as a process that separates the modern world from the traditional. It is against this backdrop that the prospects and constraints of both secularism and communalism need to be examined. While the self-delusions of heroic secularists are on the surface, it is not as if sociologists have always been able to resist giving in to the popular beliefs of their times. For example, while Parsons (1974) and Bellah (1970), following on from Toennies and Maine, detailed the unfolding of secularisation in the western world, they unfortunately concluded by conflating the ideology of secularism with the process of secularisation. In their view secularisation had brought about the privatisation of religion and religious faith on a permanent basis. Though Parsons, Bellah, Berger, and many of their followers ended on a note of high optimism, for secularism appeared a clear winner in their societies, they were as guilty as the secularists of today of letting the dominant mood of the time block off a scrutiny of the process.

This is what led some of these leading sociologists to be so confident in their assertion that the efficacy of religion from the public realm has been effectively banished by the emergence of 'civil religions' [Demerath and Williams 1985:155].. In modern societies, as a consequence, commitment is not in the name of a transcendental faith but in terms of a public ethic which is grounded in the world. It is this public ethic that constitutes the 'civil religions' of today. Like religion proper,

civil religion too excites passion, but what is more, it also functions as the key organising principle of contemporary secular social orders. Parsons and Bellah found no dearth of examples around them to substantiate what they meant by 'civil religions'. Not only was liberal democracy a 'civil religion', but so also was Marxism, Stalinism, and so on [Bellah 1970 and Parsons 1974:203]. It should be clear by now that there is a lot in common between a statement such as this and those of the 'secularists', for in both instances the dominant ideological trend takes over from an examination of the process. That in one case it is an optimistic picture, from which the actors may retire comfortably, and in the other it is pessimistic, and thus requires heroic intervention by social agents, only helps to draw attention to the fact that the process of secularisation is not exhausted by any one ideological rendition.

It will be easily recognised that the 'civil religion' of Parsons and Bellah is really a secularist utopia. In their view, once 'civil religions' set in there is no scope for religion and other ascriptive ties to exercise any ideological influence in society. There is obviously some confusion here. As Luhmann points out, though religion may no longer function as a foundational principle, this does not mean that it is now incapable of being politically persuasive, or of stepping outdoors. Luhmann thus separates "religious function", which is private, from "religious performance", which is public. In religious performance, religion is applied publicly to address problems that have emerged in other sub-systems of society but were not adequately taken care of there [Luhmann 1982:240-42, see also Williams and Demerath 1991:418-19].

In this case, the conclusion of eminent sociologists such as Parsons and Bellah, that secularisation spontaneously ushers in secularism as the dominant ideology, which in turn strictly confines religion to the private realm, appears rather unwarranted. In essence, this is a remake of the base makes superstructure theorem, no matter how unexpected it may sound coming as it does from mainstream conservative sociology. And like the earlier simplistic versions of this postulate (which had radical pretensions), ideology and social process get analytically intertwined and soon one begins to stand in for the other. This is the reason why secularism and secularisation are not always clearly distinguished in sociology, contrary to what was the initial intention of the discipline.

Secularisation and Breakdown of Localism

Secularisation implies a wide variety of phenomena, but the most important one is perhaps the development of institutions that are not bound by local customs and practices. This would have of course been impossible had not the industrial revolution occurred, which brought together large conglomerates in concentrated locations. In turn this encouraged the science of statistics and population management. The Napoleonic wars gave evidence of this new form of social control and commissariat supervision, but it was also manifest in the emergence of hospitals and in the development of urban social engineering.

Regardless of how authorities were casting about for more effective forms of legitimate control, the impetus to all this was the breakdown of the local order on an ever-expanding basis. It is not as if large population concentrations happened only with the industrial revolution, but it cannot be gainsaid that the departure from local domination and interactional systems that the early 19th century witnessed was altogether new. The transition in Europe was from stable burghers and market towns (which were often political capitals), to the development first of mills, and then the emergence of factories, which created modern cities and urban sprawls. This happened in India too except that the process was much telescoped. This is probably one of the reasons why the tensions that secularisation brings in its wake are particularly heightened in this country.

When Nisbet (1970) argued that the emergence of sociology in the late 19th century was a reaction to too much individualism brought on by the industrial revolution, he was also saying that secularisation was creating new spaces for which there was no reliable guide in tradition. Intellectuals in the late 19th century perceived a crisis in the moral order, and they believed it was urban life and the indifference to established mores and customs that were creating social tensions and anomie. Sociology was spurred by the need to offer reliable scientific methods to first comprehend this new social development, and then to control it by creating new social values which would bind individuals into wholesome and healthy collectives. One might therefore say that sociology from the beginning saw itself as performing a dual role: to examine the processes of secularisation, and to forward the credo of a 'civil religion'. Parsons and Bellah were therefore not alone, nor without precedent in the discipline.

At this point the contributions of social anthropology can help in sorting out the importance of the distinction between secularisation and secularism. In the Indian context, for instance, it has been repeatedly pointed out by Srinivas, or by Marriot, or by Singer, that tradition reorients itself to keep up with the demands of urban life and the move away from localised existence. Morris D Morris, in his path-breaking work on the working class in Bombay, found that old caste distinctions no longer worked as they used to in urban milieux, but it was not as if they had disappeared either. This sensitises us to protect ourselves against two kinds of naivete, both extremist in character. One argues that industrialisation changes everything, and with time a new moral order emerges which separates itself unambiguously from past traditions and practices; the other believes that tradition, no matter what, will never yield ground to the process of secularisation. The first variety is usually sponsored by sociologists in the west talking about their own societies, and the latter by social anthropologists when they write about oriental or non-western civilisations, and, also ironically, by secular activists whose self-image is a radical one. But both these versions are faulty, for nowhere does tradition remain unchanged and in no corner of the globe is the past completely wiped out either.

Not just large urban conglomerates, but the process of secularisation also creates an objective social space and centralised forms of governance. These two are not independent features but depend reciprocally on each other, and in this sense, give us a fuller understanding of the entire process of secularisation.

Alexis de Tocqueville (1955) had noted long ago that the emergence of centralised authority was typical of post-revolution France and that there was tremendous enthusiasm for it from the lower orders. The privileged classes prior to the revolution enjoyed status and power in a system of segmentary control. This segmentary system of governance was quite in consonance with localised juridical control and the interactional nexus on which all *ancien regimes* thrived. But obviously this was out of accord with the exigencies of the new era. Without centralisation local juridical control can never be fully overwhelmed. Unless this happens aggregation of free people in town and cities would be blocked, jamming the wheels of the secularisation process itself. The lower classes are particularly keen to push ahead with this centralisation as they are the least enamoured with either segmentary authority or with localised juridical control. Contrary to Gandhi, Babasaheb Ambekdar consistently pressed for a strong centre for only then, he believed, could depressed class grievances be adequately addressed.

The development of centralised administration must necessarily create a sense of public space, as this form of authority is not a mere aggregation, or even a focalisation, of many pre-existing local despotisms. Without a creation of public space, centralisation would be hamstrung by particular interests of different fractions of the privileged classes who are now forced to live together, much as the under-privileged are. Beyer puts this point across nicely when he writes: "(T)he person who used to be the unequivocal outsider is now often literally my neighbour. This is what Rushdie calls the metropolitan experience" [Beyer 1994:85].

The public space that emerged with centralisation is also the arena where political contests are held, and no matter how despotic the winner, there can be no return to localism

of the previous epochs, Despots, demagogues, and democrats alike are in principle forced to negotiate between divergent particularities, primarily because the ruling coalitions, or the elites themselves, are internally beset by conflicting interests. Thus while this public space may not always meet Habermas' highly evolved criteria of a developed communication system, he is nevertheless correct in insisting that it is only in secularised societies that the minimal prerequisites of a communication system can be found [Habermas 1984:77]. What secularised societies share with Habermas' model is the recognition that mutual needs are in principle negotiable, and that these negotiations have a public character about them.

As secularisation rides on the back of capitalism, it is characterised by a thermodynamic principle. The transition from mills to factories effectively depicts this transition. In closed pre-capitalist and pre-secularised society, i e, those that had not yet experienced the effects of heavy duty industrialisation, it was physical coercion, more than anything else, which determined who would be the ruler. It is not as if this modality of conquering a throne was found objectionable in principle, for it was heartily engaged in by combatants on both sides. But after the war was over the vanquished resigned themselves to obeying the suzerainty of the victor. From then on it was primarily *noblesse oblige*, and the social order settled down to long periods of peace. Such long durations without obvious signs of protest have given the impression to contemporary observers, with their 20th century sensibilites, that all was tranquil and that communities lived side by side in brotherly amity. Absence of any demonstrable signs of tension is interpreted as communal or inter-faith solidarity.

It is true that communal rivalry had no scope for routine social expression, but it is not as if it did not exist. These tensions and suspicions were quiescent for the most part, but often found expression in times of war. After the turbulence was over, if the Hindus had won then there would be no question of entertaining any demand for cow slaughter, and if the Muslims were victors then the Shivalaya could never be taller than the Mazhar. In modern parlance one might say that in a pre-secularised social formation there were fixed and stable diacritics that differentiated people along stratificatory lines [Luhmann 1982]. History repeatedly testifies to the near exclusive use of ascriptive criteria to signify the distinction between the rulers and ruled. The terminology of majority and minority makes little sense in these societies, as in most cases the rulers belonged to the minority group, and furthermore, political bargaining did not take place with currencies of that kind. But one could say this much with some certitude: if everyone behaved themselves and obeyed the prevailing rules then the structure and distribution of power would remain undisturbed. Such *ceteris paribus* postulates could be made about those times without appearing too idealistic. Individual volition was in any case greatly circumscribed, for the arena was a local one where status and face-to-face interactions provided an unchanging and stable backdrop.

Once secularisation sets in, no such stability can be assured as the society is now thermodynamically powered. Capitalism forces money to search uninhibitedly for profits, and if enterprise is held back, as the guilds were in the past, then the whole edifice of modern society would collapse. In this search for profit there is every possibility of a near anarchy of production, for which reason it is hard to foresee where the cracks between different private interests will show up. There is a certain indeterminacy and unpredictability regarding the maintenance of social harmony because the natural economy no longer operates. When Marx distinguished between collective interests and private interests (as early as in *On the Jewish Question*), he also alerted us to the divisions between private interests of different kinds, and how alliances and class coalitions appear and disappear in somewhat unpredictable ways. Capitalism therefore is quite capable of throwing up in this entrepreneurial churn newer fractions of the capitalist class as dominant groupings, or it may also warn the more established sections to take pre-emptive action against a rising competitor. The point is that all this upheaval, uncertainty and conflict, does not bring about a breakdown of order, but is in fact a demonstration of a new kind of order – one in which secularisation has taken place. In this new secularised order the stable scenario of yore is not only absent but is no longer valid.

Secularisation and Minorities Question

The relevance of keeping the process of secularisation distinct from the ideology of secularism can be appreciated if we take up the concept of minorities as it is often formulated and articulated by secularists from within the cloisters of these 'civil religions'. Minorities are visualised as permanent entities, with fixed and definite empirical manifestations. For example, from 1993 onwards the official and permanent minorities in India are the Muslims, Christians, Parsees, Buddhists, and Sikhs [see Government of India, Ministry of Welfare Notification, dated October 23, 1993].

In the contemporary context these minorities as listed by the Indian government may seem perfectly justified, even 'natural'. One nevertheless needs to be reminded of the fact that minority communities are not fixed and permanent entities but keep fluctuating like the sacral-secular dialectic of Demerath and Williams (1992:190). Sample the following variations: In the Report of Advisory Committee on Minorities (dated May 11, 1949) Muslims, scheduled castes, and Indian Christians were considered to be minorities [Shiva Rao 1968a, Vol 4: 604]. Earlier in the constituent assembly debates, K M Panikkar wanted Nambudiris to be listed as minorities (Vol 2:259). Recall that the 1932 Ramsay MacDonald Communal Award recommended that Marathas be protected in certain selected constituencies of Bombay (1968b: 742). Frank Anthony strongly advocated in the constituent assembly that the category of minorities be enlarged to include all kinds of minorities, whether of language, community, or religion [Shiva Rao 1968a, Vol 2:280]. In the course of these debates, again Sardar Hukam Singh argued that Sikhs and Parsees should be classified as minorities, but it was turned down as being quite unnecessary (1968b:772-73). There was no public outcry either against it in those years. In fact the Parsees made no specific claims towards minority status. Today, more than 40 years later, the Parsees and the Sikhs have been given minority status by the government of India. In the case of the Sikhs, after 1984, it seems perfectly justified.

It should also be noted that what makes a minority is not just religion but also certain privileged and dominant ways of designating them. A Sanatani, or a member of the Buddha Dal, or a Vaishnavite would not qualify here as a religious denomination no matter how strenuously the believers of these denominations may stake their claim.

But that is perhaps the least of the problem. Pushed to it, the proponents of secularism will merrily add to the list of official minorities. But in doing so it is never quite realised that with every passing year these categories rigidify and become impervious to the actualities that secularisation generates on the ground. The most dangerous outcome of this tendency is that it is blind to the process of *minoritisation* which often breaks protocol and targets those who are not official and permanent minorities. When secularism as an ideology estranges itself from the dynamics of secularisation as a process, it immediately surrenders itself to ahistoricism and to the most backward forms of positivist posturing. In doing so it frequently leaves the door wide open for its stated enemies to function both legitimately and effectively in the political system. And when that happens almost anybody can become the next minority, for the process of minoritisation has no permanent or official favourites.

Though Sardar Patel would have liked minorities to be limited to the scheduled castes, and as for the rest they should "trust the good sense and sense of fairness of the majority and place confidence in them" [Shiva Rao 1968a, Vol 4:606], experience has shown that minority persecution has been a very common phenomenon in independent India. As even this quote from Patel shows, the framers of the Indian Constitution were quite clearly prisoners of the majority/minority paradigm. In fact the

sub-committee on fundamental rights held in February and April of 1947 held that it "is difficult to expect that a country like India where most persons are communally minded those in authority will give equal treatment to those who do not belong to their community" [Shiva Rao 1968a: Vol 2:98]. Sardar Patel's plea to trust the majority seems weak in this light, though he too believed in the majority/minority formula, only he did not believe in extensive minority reservations. Which is why his denial to spread the minority net to include larger numbers seems unjustified and capricious.

The functionaries of the constituent assembly were in the main believers in majority/minority distinctions, whether or not they were a restricted form of minority listing, or whether or not they were secular and communal by contemporary standards. Shyama Prasad Mookerjee, who later founded the Jana Sangh, was all in favour of minority provisions. In many ways he was perhaps the forerunner to Mandal too. Not only did Mookerjee press for the reservation of seats for all *important minorities* [Shiva Rao 1968b:766, emphasis mine], but also recommended that only 50 per cent of seats be open to merit and the rest to be proportionately distributed among minorities. That many contemporary secularists are today in line with some of Mookerjee's recommendations should perhaps give them reason to reconsider many of their formulations.

In all of this it is interesting to note that Ambedkar, who is known today as the father of reservations, issued a warning, while moving the draft Constitution on November 23, 1948, that it would be "equally wrong for minorities to perpetuate themselves" [Shiva Rao 1968b:766]. In the midst of the clamour for protecting minorities it is easy to overlook how such provisions can create vested interests, and in this process go counter to some of the express intentions of the constitutionalists. Even so, except for a minority made up most significantly by Rajkumari Amrit Kaur, Alladi Krishnaswamy Ayyar, Hansa Mehta, and occasionally, B N Rau, the overwhelming mood in the constituent assembly was moulded by minority/majority consciousness. At one point when the discussion on fundamental rights was being overwhelmed by issues of minority discrimination, Alladi Ayyar was provoked to remark: "Is this a chapter on fundamental rights or is it a chapter on discriminatory provisions" [Shiva Rao 1968a, Vol 2:221]. Ayyar's pique is understandable, for the discussion on fundamental rights should insist first on the inalienable and fundamental rights of citizenship, and not let exceptions eat up the rule.

Minoritisation and Secularisation: Dynamic Perspective

In addition, as noted earlier, the thermodynamic principles of secularisation make it irrelevant to think in terms of stable minorities and majorities, for bigotry too refuses to be shackled along pre-determined lines. In such situations it is difficult to predict who will be the new minority tomorrow. The Sikhs till 1984 never imagined that they would be hunted down and quartered the way they were after Indira Gandhi's assassination. It is this fact that makes the inclusion of the Sikhs today eminently deserving, though such a claim was never entertained seriously earlier. The south Indians in Bombay had no foreknowledge that they would be the victims of Shiv Sena wrath prior to the mid-1960s.

It must be borne in mind that not all ideological emanations of capitalism and of secularisation fit in neatly with their originary impulses. Though secularism, the ideology, is a product of contemporary times for it thinks in terms of majorities and minorities, it nevertheless refuses to accept the inherent dynamic character of the social process of secularisation. Consequently it sees majorities and minorities as permanent distinctions which are fully fleshed out. This leads to the development of vested interests, as Ambedkar foresaw, and the tendency of minority spokespeople to emerge as permanent champions of the oppressed. It also undermines the ideology of secularism, for professional secularists are too closely identified with such minority interests.

To pursue our argument further it will be quickly noticed that listings of minorities are of little relevance for they do not take into account the process of secularisation which can easily nullify at one stroke the most elaborate of categorisations of this kind. Instead of making a comprehensive inventory of minorities, greater attention should be paid to the question of minoritisation and to examining the effects of that process. Instead of fixing in advance, or even adding to, minority lists, the vaunted aims of secularism can be served better if it pays attention to minoritisation, for the truth is that nobody can tell when the next minority will be you.

There are then two major variants of secularism as an ideology. The first is of the 'civil religion' kind, and the second is governed by majority/minority considerations. The first makes it seem as if there is no scope any longer for bigotry on a social scale, now that religion has been effectively privatised; and the latter is predisposed to see the world in terms of fixed expressions of bigotry which can only be overcome by upholding the sectional interests of these persecuted groups. The common feature that binds secularism of the first and of the second group is that they both see the world as a finished product. In one case there is a cheerful announcement of the end of prejudice, while in the other it is believed that minority persecution will by and large follow predetermined trajectories and therefore one needs to pay attention to certain designated minorities on a permanent basis.

But in fact prejudice knows no limit, and the lengths to which it can go are truly incalculable. Does this mean that in the face of relentless secularisation there is no scope for secularism? Should the uncertainties of minoritisation mean that we can only observe the process of secularisation that brings it about without any scope for intervention? While it is true that will power and good intentions by themselves are inadequate, it can nevertheless still be maintained that when will power and humanism take cognisance and learn from the impediments to objective social processes, then the chances of success are so much greater.

The making of minorities is quite different from the process of minoritisation. Minority consciousness grows first from within the community, and later it is recognised as such by those outside it. Any particular constitution of minority consciousness may have several historical or sociological causes behind it. There is common factor that informs the making of the different minority groups other than the issue of numbers. And of these the most effective minority is always the largest minority, or a minority of a sizeable population. But other than being smaller in numbers than the majority community, there is nothing that Parsees, Sikhs, Muslims or Buddhists have in common.

The acceptance of such communities as minorities is premised on the existence of majority and majority consciousness. Sadly, therefore, democracy is often played out in such cases as a game of numbers, and community representatives on all sides are fairly comfortable with this, for it assures them of a stable constituency.

It may have been possible to stem this process during the days when the Constitution was being discussed, but there was a lost chance there. Amrit Kaur and B N Rau provided an opening when they advocated that religious *worship* and not religious *practice* be allowed as a fundamental right. But this was opposed by the majority, from S P Mookerjee (predictably) to C Rajagopalachari. According to Amrit Kaur, allowing for freedom of religious practice meant that the playing of music before mosques, or the institution of sati, will have to be tolerated [Shiva Rao 1968b:261]. To put it in Luhmann's terms, Amrit Kaur and Rau were arguing that freedom be allowed only for the *function* of religion but not for the *practice* of it [Luhmann 1982:240-42].

Once minority and majority consciousness are in place, then it would appear as if the job of secularism is done. The minority communities are kept passive by co-opting their leaders and spokespeople into organisations like the minority rights commission, or even as MPs and MLAs. Indira Gandhi's 15-point programme is a good illustration of a political strategy of this kind that seeks to cater specifically to majority/minority consciousness. Time and

again the 15-point programme makes elaborate allowances for minorities at all levels: for loans, for housing, for education, etc, without however making these provisions statutory and binding. It appears then that if Muslims get any education at all it is because of Indira Gandhi's largesse, or because of the militancy of certain minority leaders, and not because as citizens Muslims have every right to be treated as equals. In a patronage scenario of this kind there is enough room to play back room politics, and to grandstand as heroes of minority communities.

But all these calculations do not pay attention to the fact that secularisation is a dynamic process and therefore new minorities may emerge without much warning. This process, by which minorities are created unbeknownst to them, is what has been termed here as *minoritisation*. When minoritisation takes place the communities that are picked on for persecution are decided upon by the majority, or those 'others' who are on the outside. The constitution of minority identity in these cases takes place from the outside rather than from the inside as is the case with self-constituted minorities. As it was noted earlier, the Sikhs and the south Indians of Bombay are good examples of this minoritisation process in recent times. Further, as nobody likes to be minoritised, a newly minoritised community has neither spokespersons, nor a stable constituency laid out for them in advance. This does not exhaust all the other subtleties of this process of minoritisation, and some of these should be looked at now, howsoever briefly.

While the Muslims are official minorities today this was not always unambiguously so in pre-independence days. A lot depended upon which community held power. In the Bhulabhai Desai-Liaqat Ali Pact of 1945, Muslims were not considered minorities for it was envisaged by the two leaders that the Congress and the Muslim League would share power equally. The League, however, had no hesitation in announcing the scheduled castes and others as minorities. Moreover, even among Muslims, minoritisation can take place afresh, carving out separate sections from within this community, although from the point of view of official minority spokespeople the community may appear as a monolith. During the partition days, Muslims of Karol Bagh and of Paharganj in Delhi, who were by and large Congress partisans, nevertheless died uncomprehendingly at the hands of Hindus. Though they were Muslims they had never identified themselves as minorities, and hence when they were minoritised they became utterly vulnerable. A variation on this theme occurred in Tamil Nadu where Tamil-speaking Muslims saw themselves as Muslims first and then as Tamils in 1947 – a clear departure from their earlier priorities. Minoritisation can therefore strengthen minority consciousness as much as it can create new minorities. The point however is that nobody wants to be minoritised for that can happen so swiftly and unpredictably. One never knows what combination will be brought to bear in the next round of minoritisation, and nobody is therefore completely safe. But there is a vested interest in self-constituted minority awareness for that enables one to effectively play the minority card, and both majority and minority spokespeople are fully aware of this.

Towards a Rawlsian Perspective

If the process of minoritisation can be so indiscriminate and disrespectful of previous consensus, then no matter how exhaustive the listing of minorities, the exercise will always be both incomplete and futile. Any one could be the next victim, and therefore it is important to step outside this framework and see the issue of protecting cultural rights and communities on a different basis. After all the juggling with criteria for designating minorities is over and done with, minoritisation still remains a threat. However, the one factor that remains resolute and indissoluble through it all is that of 'citizenship'. It is only by protecting the dignity of the individual as a citizen that one can mitigate the harshness of minoritisation when it takes place. Amrit Kaur, Hansa Mehta, Alladi Ayyar emphasised this point time and again in the constituent assembly debates, but their view was a 'minority' one then and so it seems to be today.

Nevertheless, it is time now to take a fresh look at this subject, for the problems of cultural persecution have not improved with the minority/majority framework in operation. In fact it has given secularism a somewhat unsavoury connotation, as there is far too much politicking and horse-trading that is legitimised on the basis of such minority provisions. The grim fact that no one can ever hope irrevocably to banish minoritisation, as secularisation allows no such optimism about anything in the future, shows up the hollowness of minority provisions.

As in the process of secularisation the next minority could be anyone (even you), it is best to proceed on the Rawlsian "principle of difference" [Rawls 1971:76-77], in which legislation is done keeping in mind that any one, including the legislator, could at some point of time be the least fortunate. Rawls, of course, advocates that there be a hypothetical veil of ignorance which prevents law-makers from identifying their interests in advance and favouring themselves accordingly. But with the unpredictability of the process of secularisation the veil of ignorance becomes a practical and real one, and no longer hypothetical. In fact, this is one case where one might be able to argue from a strong Rawlsian perspective. Regardless of the finer points of this exercise, the thrust of such a Rawlsian outlook towards secularism would undermine minority listings, and the formation of minority and majority interests, and will strengthen 'instead' the idea of citizenship. As was mentioned earlier, only one's identity as a citizen remains steadfast in the maelstrom of the secularisation process. It is by protecting this identity, and by not allowing it to be overwhelmed, or undermined, by minority and majority legislations, that the ideals of secularism can best be met. There is no guarantee of course that communalism will roll over and die, but the sides will be clearly distinguished, and it will be a glorious fight out in the open and not in the corridors of power.

Unfortunately the dominant elements among the secularists are still not prepared to re-examine this issue from a different perspective. The more honest among them hesitate to look over their shoulder, for they would then see how vested interests of all kinds are working away merrily behind their backs in the name of secularism. It is time now to look them in the eye and call their bluff!

Protection and Exports

Aditya Bhattacharjea

IN demonstrating that under certain circumstances tariffs protection can in fact promote exports by the protected industry, Marjit and Sarkar (1995; hereafter MS) have unwittingly rediscovered a result published by Bhagwati (1988) in a little-known paper. In Section I of this brief note, after restating their result, I summarise some of the important qualifications to this argument that Bhagwati pointed out, and add some caveats of my own. In Section II, I examine their parallel investigation of the export-promoting effect of a quota, and point out that they have overlooked some crucial implications of their own analysis.

I
Export-Promoting Tariffs

The figure reproduced here is adapted from Figure 2 of Bhagwati (1988), with some extra points labelled for convenience. This is essentially the same as Figure 1 of MS but is more suitable for my purposes. The setting is a domestic monopolist facing domestic demand curve AR and competitive foreign supply S_f at the exogenous world price OA. Under free trade, the monopolist can charge at most OA, and thus the marginal revenue curve coincides with S_F up to its intersection with the demand curve. The monopolist produces AC, with CD being imported. A tariff at rate t raises the import supply curve to $S_F(1+t)$ and the ceiling on the price the monopolist can charge to OE. (MS consider a specific tariff rather than ad valorem, but it makes no difference with a horizontal S_F). Now marginal revenue is the step function EFBL, and the monopolist maximises profits by supplying AB to the domestic market at a price of OE, and exporting BC at the world price OA. Protection does seem to promote exports, and from being an importer, the home country becomes an exporter of the same good, without any 'infant industry' phenomena such as economies of scale or learning by doing.

This logic is impeccable: an export-oriented rabbit seems to have been pulled out of the protectionist hat. But let us look at what went into the hat to begin with. Points 1 to 3 below are from Bhagwati (1988) with some elucidation, and the rest are my own observations.

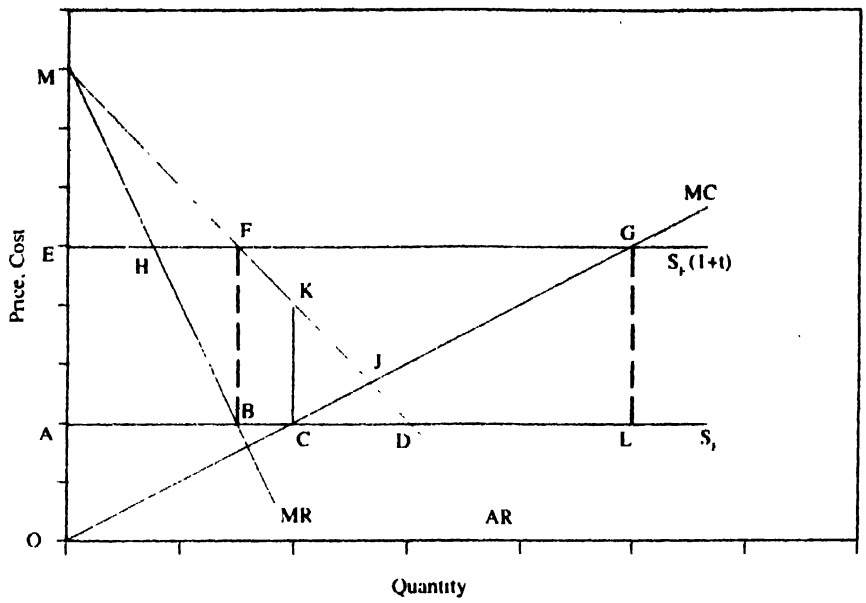
(1) Consider the same scenario, but with the world price lower and/or the monopolist's marginal cost higher, such that S_F lies below the intersection of MC and MR. In this situation it is clear that any tariff merely reduces import competition and never results in exports.

(2) MS refrain from normative analysis, but it is clear that *any* tariff in their setting reduces welfare, as conventionally measured by the sum of consumer and producer surpluses, even after including export profits. Bhagwati merely states this as self-evident, but readers may wish to confirm that at tariff rate t, although exports are maximised, welfare is in fact minimised; the area corresponding to the deadweight loss is triangle FBD. Note also that with this tariff in place, the monopolist charges a price from domestic consumers that is higher than what it would have charged under autarky! (The possibility of exporting induces the monopolist to restrict domestic sales even more than it would have otherwise.) Even if one doesn't wish to follow the conventional approach to welfare calculation, surely enhancing domestic monopoly power to restrict consumption is not the best way of promoting exports.

(3) Even if, like MS, we concern ourselves only with positive analysis, the tariff by itself is not the best export-promoting policy. An export subsidy s at the same rate (s=t) increases exports to FG without further restricting home consumption [Bhagwati 1988]. (The tariff must be retained, otherwise traders will simply import at price OA and re-export at the subsidy-inclusive price OE.) What Bhagwati does not point out is that this is even worse for welfare, with an additional deadweight loss of CGL. This policy also necessarily has a negative impact on the government budget: no imports are actually made, so there is no tariff revenue to offset the burden of the subsidy. Unless we believe in mythical lump sum taxes, the subsidy must be financed by distorting taxes on other activities, resulting in further welfare losses.

(4) MS claim that their analysis shows that "a rise in the tariff rate actually increases exports" (MS, p 809). If we trace the effect of an increasing tariff (ignoring the export subsidy) in the figure, we find that it promotes exports only over a certain range. Beginning with free trade, the equilibrium point first moves along CJ: here we have the usual protective effect, with the monopolist *increasing* his production to replace the more expensive imports. At higher tariff levels, the equilibrium moves along JKF, with domestic sales being curtailed but exports emerging only beyond K, which lies vertically above C. At rate t, exports are maximised at BC, and any higher tariff has no effect on the equilibrium. Thus, raising tariffs promotes more exports only in the range KF. Conversely, 'liberalisation' in the form of tariff reduction, which MS criticise, will have no effect on exports if a tariff rate higher than t is brought down to t. They are correct in concluding that "a lower tariff will not benefit existing exports of the same product" (p 810). But whoever claimed that it would? The pro-liberalisation literature they refer to criticises the 'anti-export bias' of protection on rather different grounds: either it diverts resources from exportables to import-substituting sectors, or it raises the cost of imported inputs used in export production. In both cases, lower tariffs are supposed to benefit exports of some *other* product.

(5) Both Bhagwati and MS assume that the country can both import and export at the same world price. In the presence of transport costs, the fob export price will be below the cif import price, shrinking the range BC over which exports are forthcoming. In particular, the export price may be below the intersection of MR and MC, where exports are unprofitable regardless of the tariff (see point 1 above).[1]



(6) Export promotion through this route would probably run foul of the anti-dumping provisions of the WTO, since the domestic firm is clearly selling its goods at a lower price abroad than at home.

(7) The model assumes a domestic monopolist. However, the larger profits created by protection might induce the entry of more domestic firms, resulting in the phenomenon of proliferating plants operating at suboptimal scale commonly observed in import-substituting developing countries. This can result in excessive entry costs [see Bhattacharjea, forthcoming, for an oligopoly model along these lines]. Export promotion may be another casualty, since the industry will then be characterised by both high costs and also greater competition, which undermines the output restriction that generated exports in the Bhagwati model.

II
Export-Promoting Quotas

I now come to the case of quota protection. Marjit and Sarkar correctly show that in the same setting, "trade liberalisation in the form of relaxing quantitative restrictions should promote exports" (MS, p 809), supporting what they call "the conventional wisdom" in favour of liberalisation. However, MS have overlooked the fact that quota relaxation also permits more imports, so the effect on *net* exports is ambiguous. Also, they have

FIGURE: PROTECTING A DOMESTIC MONOPOLIST

only compared a more restrictive quota with a slightly less restrictive one; they have not compared either with free trade. If quota relaxation promotes exports, then why not proceed to the logical conclusion of this process: a very large quota that does not bind, or even free trade? The matter clearly needs further investigation.

In fact, it is the quota itself that provides the monopolist with the ability to use its monopoly power by shielding it from imports. This allows it to curtail domestic sales and export the residual output, as in the case of the tariff. Diagrams illustrating the effect of a quota tend to be messy, but the basic point can be seen from the figure. With free trade, we have already seen that there are no exports. Now consider the most restrictive quota, that is, a complete ban on imports. This allows the monopolist to operate anywhere along the domestic demand curve, or export along S_t. Marginal revenue is therefore MBS_t, and the monopolist sells AB in the domestic market at price OE, and exports BC at the world price. This is exactly the same result as with the tariff at rate t (which maximised exports), and it has the same deleterious consequences for welfare.

However, as demonstrated by MS, relaxing the quota raises exports. (See their paper for the diagrammatic analysis.)[2] It can also be shown that the domestic price falls and social welfare rises as the quota is relaxed. Exports can be maximised at AC with an import quota of AD, and welfare is then restored to the maximum level we began with under free trade.[3] So if all we are interested in is the volume of exports, a very liberal quota can do much better than a tariff, and with welfare restored to the free trade level too. The catch, of course, is that with quota relaxation, imports also increase.[4] In fact, the maximum level of exports AC, requiring an import quota of AD, gives the same *net* imports CD as under free trade! *Net* exports therefore do not necessarily increase as the quota is relaxed from zero, and the 'trade balance' for this particular commodity must eventually turn negative as the quota approaches AD. For the linear demand case used by MS, it can be shown that exports rise only half as fast as imports as the quota is relaxed, so that *any* relaxation of the zero quota results in a *reduction* of net exports. Thus, if we are interested in maximising net exports, a ban on imports (rather than liberalisation) is the unpalatable prescription of the model, giving the same result as the tariff of t in the figure. This does not of course imply that this is a desirable export promoting policy. Most of the arguments advanced above against using a tariff (all except points 3 and 4) are equally relevant to using a quota for export promotion.

III
Conclusions

We thus see that Marjit and Sarkar's demonstration of protection inducing exports is a special case of a special model, involving a single domestic firm with marginal costs that are low in relation to the price at which it can export. It applies only to a range of high tariffs and very restrictive quotas, and even then is not really advisable.[5] I am not committed to the kind of welfare calculation used in neoclassical trade theory, but it does serve as a benchmark and as a reminder that policies that might appear attractive can be at the expense of consumers. However we choose to measure this, it must be factored into our evaluation of policy proposals.[6]

Nor do I dismiss the argument that protection can sometimes promote exports. This can be more robustly based on infant-industry considerations involving increasing returns and industrywide externalities, as in the famous paper by Krugman (1984), or some of the recent endogenous growth literature. (I might also mention Hilferding's 1910 Marxist classic *Finance Capital*, which pointed out that German industrial cartels actively sought protection of their home market and used the profits earned there to cross-subsidise their exports.) The enduring dilemma for policy-makers is how to protect industrial infants without allowing them to become senescent, and to force them to export.

Notes

1 We need to assume some positive but arbitrarily small transport costs to rule out the possibility of exports under free trade, for otherwise the monopolist would be indifferent between supplying the domestic and foreign markets at the price of OA.

2 There is a small error in their diagram, which does not however affect their result. They depict quota relaxation as "a downward parallel shift" of the domestic demand curve facing the monopolist. Enlarging the quota should actually be shown as a leftward shift of only the portion of the demand curve above the world price (MD in our figure), since if the monopolist charges lower prices it can undercut imports and serve the entire market, regardless of the quota [see Helpman and Krugman 1989:27-34]. However, the equilibrium is never on this lower stretch of the demand curve (below D) since the opportunity to export at the world price makes S_t the floor for perceived marginal and average revenue.

We are also interested in purchasing single books/individual collections/ whole libraries of antique/rare books. *Books signed by Mahatma Gandhi, Jawaharlal Nehru, Indira Gandhi, Rajiv Gandhi, Tagore and other nationalist leaderss are of special interest.*

3 There is in fact a discontinuity as the quota limit approaches AD where the equilibrium reverts to the free trade scenario as the monopolist finds it more profitable to supply AC to the domestic market If transport costs are arbitrarily small, this occurs when the quota is arbitrarily close to AD, and we can ignore it for practical purposes

4 We have in fact an unusual instance of two-way trade in identical products Brander and Krugman (1983) demonstrated this with an international duopoly model As in their model, the basis for this is price discrimination, with the monopolist charging a lower price in the market with more elastic demand, i e the foreign market Also, as in their model, such apparently wasteful 'cross hauling' of the same goods increases welfare relative to the autarky scenario (because of greater competition), unless transport costs are significant

5 MS are also sceptical of the view that domestic demand has a negative effect on exports However it is easy to see that for any given level of the tariff or quota at which exports are forthcoming a rightward shift in the demand curve does lead to a reduction in the volume of exports

6 Some years ago, I intervened in a very similar debate in *EPW* in which Mehta, Nambiar and Sau showed that a tariff on imports from a *foreign* monopolist would reduce a reduction in the import price There too I pointed out that (a) this was a standard result in the literature on trade policy under imperfect competition (b) that it was subject to several qualifications including the convexity of the demand curve; and (c) the price to domestic consumers would still rise, so that a tariff would not yield the 'free lunch' they thought it would See Bhattacharjea (1988) for a summary of this controversy

Reservation Policy for Small Industry

K R G Nair

IN his article M H Bala Subrahmanya (*EPW*, May 27) gives a brief historical survey of policy measures concerned with small-scale Industry (SSI) in India. He then carries out a somewhat detailed examination of reservation for SSI – a unique aspect of this policy. According to him, this is neither based on economic logic nor has it delivered the goods in terms of objectives fulfilled Further, he is of the view that the reservation policy for SSI does not fit in with the scheme of things when the whirlwind of liberalisation and globalisation is sweeping most countries including India off their feet

There can indeed be no dispute with some of his basic arguments There is universal agreement on the point repeated by him that if there is a sector with very few economies of scale and competitive conditions prevail, economic rationality will lead to production taking place only on a small scale, reservation or no reservation. But if there are considerable economies of scale, a firm continuing to remain small just to reap the special incentives for small firms would be denying the consumers and the economy the many advantages of large-scale production of the commodity concerned. A policy of reservation can abet this tendency, since it disallows large firms from entering the industry and outcompeting the inefficient and small firms All this comes out prominently in the case of some sectors of modern SSI where, due to financial inability or possible unwillingness to cease being small, firms do not go in for technological upgradation and large firms, willing and able to do so, are prevented from entering the field

One is constrained, however, to question his reasoning that reservations for SSI leads to a competition-free situation. It goes without saying that sectors with little economies of scale are the ones where conditions are tailor-made for the prevalence of competition with a large number of small producers each producing a very small part of the output of the industry and hence having little control over total supply. Reservation does prohibit large producers, who would in any case not have much economic logic to enter the field, from entering the fray There is, however, no bar on as many small entrepreneurs entering the field as are able and willing to do so. The argument that reputed concerns with money to invest are prevented from entering the field is also not true because there are many instances of the starting, clandestinely or even openly, of small-scale subsidiaries of large-scale concerns. Further, large concerns which export more than 75 per cent of their output are not prevented from entering an industry even if it is reserved for the small sector. Moreover, the policy of reservation coupled with concessions enables entrepreneurs willing to enter any small-scale industry to do so without much difficulty. In view of all this the argument that reservation for small-scale industry has led to the curbing of competition does not seem to cut much ice at least in sectors where there are little economies of scale

One is also sceptical about the point made by Bala Subrahmanya that reservation has not led to diversified growth of small industry He bases his argument on the finding from the two Censuses of SSI. He uses the fact that 78 per cent of the value of output of reserved SSI in 1987-88 came from just 48 out of the 843 reserved items to rub in his point that there has not been diversified development of small industry But in the same breath he complains of the fall in the relative share in the reserved SSI output of 11 top items, which have been on the reserved list from the 1970s, from around half to about 1/8th between 1977-78 and 1987-88 If both the pieces of evidence are taken together, they only indicate that while there is domination by some sectors, this is becoming less over time. In any case, he himself admits that comparisons over time are difficult because of the fact that the number of items on the reserved list has been undergoing changes over time. On top of all this, in view of the heterogeneous nature of items in the reserved list, there is no economic logic to expect diversified growth of sectors in the reserved sector.

The weakest link in Bala Subrahmanya's argument is the discussion on relative rates of capacity utilisation and of growth of the reserved and unreserved sectors of the SSI He infers from Tables 2 to 4 and 6 to 8 that capacity utilisation as well as growth for the reserved sector is considerably lower than that for the sector as a whole. Table 2 indicates that capacity utilisation for the reserved sector has increased over time in contrast with capacity utilisation for the SSI and also that, while capacity utilisation for the reserved sector is lower than that for the SSI as a whole, this difference is declining over time. He makes more direct comparisons between capacity utilisation in reserved and unreserved sectors in Table 3. The table reveals that there are no major differences in capacity utilisation between the 843 reserved items and the 6,577 unreserved items. In fact, while the figure for capacity utilisation for the former is 47.43, the corresponding figure for the latter is only a little higher at 50.49. Actually of the 17 industries which are considered for

comparing reserved and unreserved items, there are six for which capacity utilisation is higher for the reserved sector compared to the unreserved one. Regarding relative growth rates again, the evidence provided is far from conclusive. Table 4 gives rates of growth for three years, 1985-86 to 1987-88, and shows that while the reserved SSI sector grew at the rate of 10.3 per cent per annum, the corresponding figure for the unreserved sector is higher at 13 per cent. It is, however, usual and more meaningful to calculate growth rates for longer periods and this is done in Tables 6 to 8. Table 6 indicates that for the top 11 items which have been on the reserved list since the 1970s, the growth rate comes out to be 11.55 per cent for the period 1972-73 to 1987-88. Tables 7 and 8 show that while the average rate of growth for six top items which were taken off the reserved list during the period was only 13.87 per cent the 10 items which entered the reserved category during this period experienced a much higher annual growth rate of 23.34 per cent

Some recent evidence regarding the relative performance of SSI in comparison with large-scale industry in India by Subrahmanian (1995) enables us to draw interesting inferences not supportive of the ones by Bala Subrahmanya. Subrahmanian analyses ASI data for 1990-91 to show that capital productivity starts declining after the firm reaches the size-class of 50-99 workers. With an average capital labour ratio of Rs 48,530 for this size-class, the results may be considered to indicate that, in general, till the stage the small firm expands to have a capital of Rs 36.40 lakh, there are clear cost advantages of expansion in terms of size. In India, however, SSI units have been defined, since 1991, as units with fixed assets valued up to Rs 60 lakh. So the argument that certain items reserved for production by such SSI units are *ipso facto* inefficient because they cannot reap reduction in cost, available as a result of expansion, does not cut much ice. Further, Subrahmanian (1995) provides considerable evidence to suggest that the SSI sector, in the protective framework, has shown a relatively better performance in terms of output, employment, transformation efficiency and capital productivity in comparison with the large-scale sector. He does throw up some evidence also to prove that technological progress of SSI in India has been rather low and hence makes a plea for a promotional policy along the lines of South Korea, combining credit support with technological development.

There is thus no clear and definite evidene so far to warrant the dubbing of reservation as the villain of the piece in the policy package for SSIs in India. Much more in-depth and detailed comparative studies are called for before any such inference can be drawn. One has hence to consider the somewhat impressionistic argument that SSIs in India are technologically backward as a result of protective measures like reservation with great caution. Such views have to be taken alongside the finding of Freeman (1974) that small-scale units are better than large-scale ones in terms of innovation and in their inventive performance per unit of R and D expenditure

[The author wishes to thank N K Nair of the National Productivity Council for useful discussions while holding sole and full responsibility for views expressed. Thanks are also due to Atchyuta Rao for secretarial assistance.]

BOMBAY BRANCH

Schedule 14 — Notes forming part of the Accounts for the year ended 31st March, 1995

1. **Principal Accounting Policies**

(a) **General**

The accompanying financial statements have been prepared on the historical cost basis and conform to the statutory provisions and practices prevailing in the country.

(b) **Transactions involving foreign exchange**

(i) Monetary assets and liabilities have been translated at the exchange rates prevailing at the close of the year. Non-monetary assets have been carried in the books at the contracted rates.

(ii) Income and expenditure items have been translated at the exchange rates ruling on the date of the transaction.

(iii) Outstanding forward foreign exchange contracts have been revalued at the exchange rates prevailing at the close of the year and the resultant profit/loss is transferred to revenue in accordance with FEDAI guidelines.

(c) **Investments**

(i) Investments categorised as 'permanent' are valued at cost. The excess of acquisition cost over face value is being amortised over the residual maturity and the discount over face value, being unrealised gain is ignored.

(ii) Investments categorised as 'current' are valued as follows:

- where quotations are available, at cost or market value, whichever is lower.
- where quotations are not available, on a yield to maturity basis as prescribed by Reserve Bank of India

(d) **Fixed Assets**

(i) Premises and other fixed assets have been accounted for at their historical cost.

(ii) Depreciation has been provided on the straight line method at rates specified by The Chase Manhattan Bank, N.A. In respect of additions during the year, depreciation is provided with effect from the month in which the addition is made. In respect of sale/disposals, no depreciation is provided in the calendar month in which the asset is disposed of.

(e) **Staff Benefits**

Contributions to the Gratuity and Pension benefits are made on cash basis.

(f) **Net Profit/(Loss)**

The net loss disclosed in the Profit and Loss Account is after:

(i) Provisions for taxes on interest income and wealth tax in accordance with statutory requirements.

(ii) Adjustment to the value of 'current' investments in Government and other approved securities in India valued at lower of cost or market value, whichever is lower.

(iii) Other usual or necessary provisions.

2. This being the first year of operation, the accounts have been prepared for the period from 21st September, 1994 to 31st March, 1995. Consequently, Previous Year figures have not been given.

3. Expenses relating to the Bombay branch, incurred by the Head Office and other Chase offices have not been charged to the Profit and Loss Account.

4. Pre-operative Expenses incurred by the Head Office on behalf of the Indian Branch amounting to Rs 21,469,290 are to be amortised over a period of 48 months. An amount of Rs 2,683,662 has been amortised *pro rata* to the Profit and Loss Account under the head 'Other Expenditure' and the balance amount of Rs 18,785,626 has been carried forward under the head 'Other Assets'.

5. Other Expenditure, inter alia, includes recruitment expenses, professional charges, travelling, conveyance and business promotion expenses.

Auditors' Report on the Indian Branch of the Chase Manhattan Bank, N.A.

We have audited the attached Balance Sheet of the Indian Branch of the Chase Manhattan Bank, N.A. as at 31st March 1995 and also the annexed Profit and Loss Account of the Indian Branch of the Bank for the period ended this date.

In accordance with the provisions of Section 29 of the Banking Regulation Act 1949, read with the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and the Profit and Loss Account, are not required to be and are not drawn up in accordance with Schedule VI of the Companies Act, 1956. The accounts are, therefore, drawn up in conformity with Forms 'A' and 'B' of the Third Schedule to the Banking Regulation Act, 1949.

We report that in accordance with sub-section (3) of Section 30 of the Banking Regulation Act, 1949.

a) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purpose of our audit and have found them to be satisfactory.

b) The transactions which have come to our notice have been, in our opinion, within the powers of the Indian Branch of the Bank.

c) In our opinion, proper books of accounts as required by law have been kept by the Indian Branch so far as appears from our examination of those books.

d) The Balance Sheet and Profit and Loss Account of the Indian Branch of the Bank dealt with by this report are in agreement with the books of account.

e) In our opinion, and to the best of our information and according to the explanations given to us, the Balance Sheet and Profit and Loss Account, together with the notes thereon, give the information required by the Companies Act, 1956, in the manner so required for the Banking Companies and give a true and fair view of the state of affairs of the Indian Branch of the Bank as at 31st March, 1995 and of its loss for the period ended on that date.

IDBI ASSURANCE. ANYWAY YOU LOOK AT IT!

Every month.
Every quarter
All at the beginning.
All at maturity.

YOUR FOUR-WAY OPTION WITH IDBI'S FIXED DEPOSIT SCHEME*

TYPE	MINIMUM DEPOSIT	YIELD STRUCTURE
Monthly Income Option	Rs.18,000	Rs.195 every month on a 5 year deposit of Rs 18,000.
Quarterly Income Option	Rs 10,000	Rs.325 every quarter on a 5 year deposit of Rs 10,000
Lumpsum Discounted Interest	Rs.10,000	You will get Rs.4,572 immediately on a 5 year deposit of Rs.10,000.
Cumulative Option	Rs.10,000	A Rs.10,000 deposit becomes Rs.18,958 in 5 years.

** Interest upto Rs.13,000 on the above deposits is tax-exempt under Section 80L of the Income Tax Act, 1961*

MINIMUM DEPOSIT: Rs.10,000

Beyond the minimum amount, you can deposit in multiples of Rs.1,000. The base interest rate for a three year deposit is 12.5%. And a deposit period of five years and more fetches a base rate of 13%. What's more this deposit comes with the guarantee of India's premier development bank - IDBI. Reflected in the FAAA rating by CRISIL given to this product indicating the highest degree of safety. Naturally, an organisation that has total assets of over Rs.36,000 crores can take very good care of your investment. For more details contact your nearest IDBI office or any authorised IDBI agent.

Innovation and Liberalisation

A feature of India's technological development is that whatever little innovation has taken place has been minor innovation, including adaptation of process to indigenous raw materials, instead of major innovations at the frontiers of technology. Can the present liberalisation efforts through successive reduction of tariff rates reverse the trend? **2269**

Too Close

While there has been so much concern about the presence of foreign troops in Jammu and Kashmir compromising the country's sovereignty, the army and everyone else is complacent about the rapidly expanding Indo-US military ties, including the participation of US nuclear powered vessels in joint exercises in the Indian Ocean. **2228**

Experience of Widowhood

Patriarchal practices among the different castes, though dissimilar, are part of a larger structure of caste, production and reproduction. Further, cultural codes form a basis for the hierarchy of castes in which not only are castes ranked in an elaborate hierarchy, but there is an ideological and material rationale for the hierarchy. The experience of widowhood must be firmly situated in a certain kind of production relations apart from its patriarchal context. **2248**

PDS and the Poor

The revamped public distribution system introduced in 1992 was meant to expand and improve the system of delivery of commodities through fair price shops, especially in 'backward' areas. Has the scheme worked? **2230**

Water Management

The government's recently-evolved approach to watershed development in drought-prone areas, while allowing for greater local level flexibility, still ignores gender issues and common property resources. **2231**

Stagnant Scholarship

Unlike other area studies, the study of Indian politics in the US has remained a stagnant sub-field of American political science While there are ideological and academic reasons for this, it also stems from the restrictions placed on foreign scholars by the government of India. **2257**

People at Work

America's poor are disappearing into prisons and into correctional industries where the unemployed and the reserve army of labour are being held in place. **2237**

Rewarding Neglect

The prime minister's intervention overturning the rural development ministry's decision to withhold development funds to the state for non-compliance with the requirement of holding panchayat elections only shows the Congress Party's disinterest in revitalising the panchayat system. **2235**

Women's Voices

In social sciences, especially in women's studies, there is a time just to listen and a time to analyse. The present in feminist academics is a time to listen and for the time being put theorising and analysing on the back-burner. **2272**

Police Rights

With the Left Front government in West Bengal defending every action of the state police, the Congress is emerging as a champion of human rights **2234**

Population Dynamics

Contrary to customary assumptions, population growth in conjunction with other determinants of development has in many instances promoted social change, and has even been a boon to economic growth in the newly industrialised countries **2272**

LETTERS TO EDITOR

Fiscal Transfers to States

THIS is with reference to B P R Vithal's comments (July 15) on my article on the Report of the Tenth Finance Commission (April 22).

I am prepared in view of what Vithal points out, to settle for two-and-a-half cheers to the TFC for referring to Raj Krishna's views on the contribution criterion. Raj Krishna's dissenting note to the Seventh Commission's Report had succinctly and conclusively argued the case both for sharing income tax and excise duties on identical criteria and for eliminating the contribution criterion in income tax. I felt that the TFC, by not quoting Raj Krishna's argument in full, had missed the opportunity to gain strength for its views. But, then, I suppose that no Finance Commission likes to dilute the originality of its recommendations.

Vithal's second comment is the substantive one. In the alternative scheme for devolution I had proposed, I had suggested including plan transfers in the revenue account in the constitutionally entrenched ratio for sharing the centre's aggregate tax revenues with the states. Vithal does not find this acceptable on the ground that my suggestion "ignores the fact that plan transfers to the states have been coming not out of the tax receipts of the centre but from its deficit". No transfer of any kind can 'come out' of a deficit; deficits result from transfers and not vice versa. Obviously what Vithal appears to mean is that with the centre's revenue account being in deficit after allowing for its non-plan revenue expenditures and statutory devolutions there is no room left for plan transfers. In fact, as table 5 in my article shows, the centre's pre-devolution surpluses were not adequate for making even the statutory transfers to states in four out of five years during 1990-91 to 1994-95. As Vithal himself points out, the situation has worsened in 1995-96 (BE) despite the TFC's valiant reassessment of the centre's forecast for which Vithal claims credit. In other words, even statutory transfers have been (partly or wholly) "coming out of the deficit" (as Vithal might say). Would this then not contradict the TFC's proposal to entrench statutory transfers as well in the Constitution? Secondly, there is no reason why plan transfers cannot also be made statutory. In paragraph 2.27 of its report the TFC has said "We are of the view that there is a clear rationale for the Finance Commission to deal with the revenue account as a whole, and not merely the non-plan revenue expenditure". All that my proposal does is to operationalise this clear rationale by including plan transfers (at historical levels) within the purview of the constitutional entrenchment, extending the TFC's own recommendation that transfers to states could be so entrenched. If you can half-cross the well why not do it fully?

What concerns me most is Vithal's stand that consequential revenue deficits at the centre should be a deciding factor in determining transfers to states on the revenue account instead of such transfers being reasonably adequate to cover the revenue deficits in the states. Action is clearly necessary at both levels to bridge revenue deficits and all the more so at the centre for the states are not in a position to print notes. There is surely much scope for the centre to reduce its revenue deficit by economising on its expenditures and by raising more revenues rather than by reducing transfers to states. In particular, the centre has miserably failed in enforcing the collection of taxes shareable with the states. I had drawn attention to this in the following paragraph of my article:

> It is a matter for much disappointment that the TFC, while reviewing the centre's forecasts has not referred to the need for better enforcement in the collection of the shareable taxes. High levels of tax evasion in personal income taxes and in excise duties have seriously jeopardised the revenues that the states could expect to get from these two sources. The Tax Reform Committee under the chairmanship of Raja Chelliah had pointed out that not more than 30 to 35 per cent of legally taxable incomes in India are being disclosed for personal income taxation. It has estimated that if a 60 per cent disclosure is enforced and the average effective tax rate is improved from the current 16 per cent to 20 per cent, the yield from income tax would go up to 2.5 times its present level. Similarly there is clearly much scope for improving excise yields through tackling tax evasion. Given this background the Commission's silence on the importance of curbing evasion in improving receipts at both levels and the centre's responsibility in the matter is indeed a serious lapse.

It is indeed regrettable that the only member of the TFC with experience as a finance secretary in a major state should have taken such a pro-centrist stand as that implied in Vithal's letter.

S GUHAN

Madras

Path of Growth

THE Review of Political Economy (June 29) especially Romesh Diwan's article merits attention and discussion. Romesh Diwan is right in saying that it is difficult to say who was guilty in the story of *Ramayan*. Similarly, in a story of economic reforms how can one prove beyond doubt that the power base is shifting from industrial to financial capital. These are so interdependent and inseparable that the story might end up in a discussion of the egg and the hen. In a political system based on a particular ideology every policy including economic reforms will be motivated by that political ideology.

Presently at the macro-level power is associated with technological strength. There was a time when power was associated or equated with manpower. Then came a period when 'isms' were the dominating factors. With the liquidation of USSR as a super-power, we are banking on technology as a source of economic growth. Capital and technology are presently concentrated in a few developed countries. The armed forces of these nations are now being deployed to safeguard technological or industrial interests. The Gulf war with the intervention of multinational armed forces is one recent example.

If the route for economic growth has been charted through technology, then any government will have to depend upon rich people (whether NRI or resident non-Indians). The rules of economics, the politics of power, the desire to become rich and a corrupt government machinery are some important factors which are leading us down the garden path as we are not prepared to live once again as a tribal society.

ECONOMIC AND POLITICAL WEEKLY

In Decline

EVEN as the gruesome accident at Ferozabad claiming over 450 lives is rapidly vanishing from public memory, what is clear is that it was entirely avoidable – it was no freak incident, nor were there unprecedented and unexpected events, mechanical or human, which could not be foreseen. For, going by the record of the railways in the past few years, the deterioration which has set in at every level of the orgnisation, the mis-prioritisation and most of all the 'politicalisation', a major disaster was on the cards. It just so happened that it occurred at Ferozabad.

The railways are in a sense the last bastion of public enterprise, the only existing state-sector empire which may be exploited to advantage by political parties elected to give direction to the administration of the state. And in the years past the railways have yielded great gains – every minister in charge has been able to go back to the people (of his constituency) at election time with promises and 'gifts' of railway lines, extra superfast trains, electrification of tracks, new stops, and so on. Such components as signalling and safety equipment are hardly the visible 'rewards' one can talk about on public platforms. No other public sector enterprise owes so much for its destruction to the public servants, viz, the political leaders and the bureaucrats, as does the railways. Ironically, it is in fact the capability of the railways to provide an infrastructure-starved people with reliable and cheap service that has led to the distortions in their development.

Having fixed the major blame for the accident on Ghorelal, the absconding switchman at Ferozabad, the railway safety board inquiry will, no doubt, routinely review the factors contributing to the mishap and produce a set of recommendations, which in time will add to the files at Rail Bhavan, or wherever it is that such documents find their place of rest. The attitude, whether of political leaders and parties, the people's representatives or rail bureaucrats or the technical experts is not of problem-solving but of finding a victim or victims. And, while the fact that the railway minister did not own moral responsibility for what is after all one of the worst disasters for the Indian Railways, is repugnant, it is rather pointless to attempt to foist such a responsibility on the conscienceless.

Even in the realm of fixing technical problems which have contributed to the accident, the entire exercise is directed at apportioning blame rather than attempting to limit or eliminate a repetition of the disaster. Much has been said about the inordinately slow pace of introducing track circuiting and panel interlocking systems and the provision of axle counters on trunk routes and auxiliary warning systems. The section where the accident took place, although one of the busiest in the region, did not have any of these features which make for safety and can also override manual mis-signalling. There has also been a great deal of discussion about the need for greater sophistication in communication and signalling systems. These features have been progressively approved by the various departments of the railways at different times, usually in response to particular events which have then been fitted into a modernisation programme. Moreover, the existing structure of responsibilities in the Railway Board, as the Prakash Tandon committee reportedly noted, has led to inter-discipline rivalries. Safety, for instance, is everybody's concern but really nobody's, with the existing directorate of rail safety given low priority and status. Inter-departmental and inter-service rivalries and petty quarrels have been allowed free play to the extent of severely damaging the system.

The railways have long suffered not only from being treated as the politicians' own bountiful 'gift bag', but also, like so many other public sector giants, from the destructive effects of the policies followed by the ruling elite. Railways' capabilities in the area of research and development have been systematically undermined and undervalued. Imports have been preferred to indigenously developed products, whether it is sophisticated locomotives, wagons and carriages or communication and signalling systems. There are so many stories of indigenously developed products being rejected for flimsy reasons, such as non-compliance with delivery dates, non-availability of minor features, inability to provide impossibly high performance guarantees or stated cost factors while accepting outmoded, poor quality foreign equipment.

Interestingly, the government has coincidentally tabled in parliament the report of the railway convention committee constituted to review the progress of the modernisation programme, which more or less dismisses the R and D capabilities of the railways. On the ground that the railways were not capable of taking care of the modernisation efforts, it recommends that other public sector undertakings and IITs should be approached to help in the required innovative efforts. It is hard to accept that the railways' consistent efforts to create an R and D base in all aspects, some of which have contributed to railway projects abroad, should now be found so wanting. There has also been the move towards 'full automation', despite the fact that such a programme would not only be financially unviable, but perhaps even unnecessary in the light of other countries' experience.

In other words, there is an irrationality in the response of the authorities to the accident. Even before the inquiry report is out, moves are already on to push favourite solutions, giving little thought to what is obviously a high priority – to examine the report of the committee set up to review modernisation and ensure that it has indeed gone into the problem thoroughly, and then to arrive at comprehensive programmes which would make the railways not only more efficient and modern but, most importantly, safe. The human cost of rail accidents such as the Ferozabad one is too high to be paid for the shenanigans of political leaders and their anti-people policies.

PUNJAB

Uncertain Times

THE assassination of Beant Singh, chief minister of Punjab, does not signify revival of the militant movement in the state. The movement had never died down; it had only been suppressed or driven to exist outside Punjab.

The conditions which gave birth to the militant movement, in other words, remain to be tackled. And so do the consequences of the policy of suppression such as the widespread violation of human rights which helped the movement take root. While the violation continued even after the movement was officially claimed to have been wiped out, it has already found a resurgence after August 31 and is bound to gather force in the coming days and months.

The real significance of the assassination, therefore, lies in the political sphere, particularly the impact it will have on the fortunes of the Congress and the Akalis in the state. These fortunes will, nevertheless, have a lot to do with the policy of suppression which finds continuation in the figure of K P S Gill, the state police chief.

Since the main victim of this policy will be – as it was earlier too – the rural population, it may strengthen the feeling of resentment, in this segment of the populace, against the Congress. On the other hand, the urban, especially the Hindu, population, which has traditionally favoured the policy of suppression of militancy, will feel constrained to reintegrate its support behind the Congress government which may have, in the last couple of years, tended to waver.

The resentment against the Congress among the ruralites will not necessarily benefit the Akalis, particularly the hardliners among them. In fact, the hardliners, who back the militant movement, have enjoyed very little support in the countryside which has remained confined to a limited number of rural pockets. In the period immediately before the Beant Singh government took over, this support, too, had tended to evaporate due to the excesses committed by the militants with regard to the rural population. In other words, during the heyday of militancy rural Punjab had rejected both the Congress and the militants. This rejection, however, did not transform into allegiance to the moderate Akalis who had either ceased to exist or were lying low. It was only when the Congress government forced the militants to go underground that the moderate among the Akalis began to re-emerge and regroup their forces. Led by Parkash Singh Badal, who had never openly challenged the militants, they had of late been extending their base as was evident from the couple of victories they posted in the assembly by-elections. This process may now suffer a temporary setback due to the general hardening of public feeling in the wake of the assassination. On the other hand, the moderate Akalis may actually gain from the assassination and its aftermath with both the government and the Akali hardliners reminding the people of the most fearful period in the recent history of Punjab which they would want to forget.

A lot would depend too, upon the policy and the performance of the Congress government under the new chief minister Harcharan Singh Brar and on the ability of the militants to re-establish their ascendancy on the politics of the state. Beant Singh's was a particularly corrupt government and whatever popularity it may have gained due to its handling of the militancy, it had begun to lose on this score. Brar has always been one of the lesser known and less influential Congress politicians in the state and his hold over his ministry and the administration is yet to be seen. If he manages to provide a clean administration (an impossible task in contemporary Punjab where the politicians, the bureaucracy and, above all, the police are corrupt to the core), the Congress may come back to power in the next election. If he contains the militancy but otherwise falters, it is the moderate Akalis who would gain. If he fails in both these tasks, Punjab will once again enter uncertain times.

EXCHANGE RATES

Markets and Governments

WITHIN a period of eight months the US dollar has swayed from around 100 yen to 80 yen and back to 100 yen. Against the German mark also there has been a similar movement of the dollar, but the magnitude of the swing in either direction has not been that large.

What could be the factors behind the fluctuations in the dollar's exchange rate *vis-a-vis* these two major currencies, of countries with substantial current account surpluses against the US as well as the rest of the world? This question is important not just for its academic value but for its significance for policy purposes.

The theory that exchange rates are determined fundamentally by the relative purchasing power of currencies was given up long back. Its irrelevance has been exposed more and more in recent years as capital movements across national borders have increased so that trading in foreign exchange today is far larger than would be necessary for the purposes of transacting foreign trade. Some estimates are that foreign exchange transactions are 70 times larger than the value of foreign trade. So if one has to seek an explanation for the swings in exchange rates, the explanation has to be sought in the realm not so much of foreign trade as of capital movements. It ought to be added here that according to most estimates of purchasing power, the US dollar should command more than 200 yen and over two German marks whereas the rate it has now reached is 100 yen and 1.45 German marks after touching a trough a few months back of 80 yen and 1.35 marks. And if the fixed exchange rate undervalues the US dollar so very grossly, even at the level it has just recovered to, the question one ought to be asking is why the US still sells so much less than what it buys from abroad. But that is not the immediate question.

If the direction and magnitude of capital movements across national frontiers are a major factor in the determination now of exchange rates, it is tempting to say that it is the international capital market which increasingly influences changes in exchange rates. The experience in the past couple of months points, however, in a different direction. The single most important factor behind the recovery of the dollar's exchange rate *vis-a-vis* the yen and the mark is the concerted intervention in the currency market by the three central banks, the US, Japanese, and German, not only in terms of purchase of dollar securities but also in the matter of interest rate changes. Nobody can claim that the so-called fundamentals behind exchange rate determination underwent major alterations. If in the first half of the current calendar year the dollar was allowed to decline, even that possibly was because the monetary authorities, at least in the US, wanted it perhaps to put pressure, especially on Japan, to let more US imports in. If subsequently the monetary authorities decided, on a reassessment of the impact of the dollar's decline, that the cost was far too much and that therefore it needed to be reversed, they have demonstrated that they can effectively bring about the desired change.

Ultimately, therefore, it is the monetary authorities in whose hands the movements in exchange rates under the present highly managed world financial system rests. That is the principal lesson one can draw from the experience of exchange rate fluctuation over the past eight months, not that markets have come to occupy the centre-stage. Markets did not lead before. They are unlikely to lead in future, though they will always be at hand to take advantage of the lack of co-ordination and uncertainties of the actions of monetary authorities.

SCIENCE EDUCATION

Misplaced Priorities

J V Deshpande writes:

A MUCH-QUOTED statistic of the past few decades is that India possesses the third largest scientific manpower in the world. The statistic, derived from the number of

degree/diploma holders turned out by Indian universities and polytechnics, cannot be disputed. In fact, with the break-up of the former USSR, it would now be quite safe for India to claim the second largest scientific manpower in the world. The 150 or more Indian universities are even more fecund in the matter of producing masters and doctors in scientific subjects. Although exact figures are not at hand, an educated guess is that India easily leads even the US in this respect.

Yet, all is far from well. This is conceded even by those in authority. A telling reflection of this is to be found in the results of the 'eligibility test' devised by the UGC/CSIR for applicants for college lecturerships and research fellowships. Formally, the basic requirement for either is a 'consistently good' academic record which, in practice, is translated to mean 'at least 55 per cent or more marks at both bachelor's and master's level'.

With the third (or second) largest scientific manpower and with employment so scarce for the educated (and of course the uneducated), one would imagine that it would not be difficult to get the required number of persons with a 'consistently good' academic record to fill the available positions of lecturers/research fellows in the institutions of higher learning in the country. And indeed it has not been. The problem has been that the performance of most of those so recruited falls far short of job expectations. This is not only in respect of advanced research work in universities but also the more mundane job of teaching younger generations of would-be scientists/technologists.

It is to meet the criticism that the quality of teaching and research in Indian universities has been going down and that not much credence can be given even to master's and doctor's degrees handed out by them that, some five years back, the UGC/CSIR introduced the 'eligibility test' for persons already holding master's degrees or having higher qualifications. The results of the tests in the past five years have borne out the substance of the criticism. By and large, not more than 10 per cent of persons already officially qualified were found suitable under the test. In some states, the percentage was less than five.

The UGC is the main dispenser of grants and patronage in higher education and is ideally placed to maintain and improve the levels of competence of colleges and universities. Not only has it failed in this respect, but by introducing a super-qualifying test of its own the UGC has only publicly acknowledged its lack of faith in the working of the colleges and universities supposed to be looked after by it. One would have thought that the educational authorities would sit up and take note of this dismal evidence of the quality of postgraduates that are being churned out by the universities. In particular, one would expect the UGC to be concerned about this. But for many years the UGC has been almost exclusively devoting itself to the question of salary structures of college teachers. It is time that it concerned itself not merely with salary structures but also with the rapidly deteriorating other conditions in colleges and universities which deter potentially good scholars from entering the teaching profession and, once in, affects their scholarly performance.

There is no evidence of any such study being undertaken. Instead, according to reports, the central government is planning to start a new elite Science University to help improve the level of science studies in the country. It is reported that the prime minister's office has already cleared the project which is estimated to involve an outlay of over Rs 200 crore. It is to be remembered that the annual total central outlay on education is about Rs 500 crore. Even though there are over 150 universities in the country, the major part of the central government's allocation to higher education goes to the centrally-sponsored universities, which are less than 10.

This will not be the first time that the government has come up with such a solution to the problem of quality of higher education. The IITs are now over 30 years old but their existence has not led to any improvement of the educational standards of other institutes nor has the opening of Navodaya schools helped improve other schools. To expect that an exclusive, elitist institute will tackle the problem of mass quality education would be naive.

We already have a few first rate science institutes such as the Indian Institute of Science in Bangalore, the TIFR in Bombay and the Indian Statistical Institute. Rather than start a new university for science, the government would do well to find out why these institutes taken together have been unable to locate more than a hundred or so first rate students every year from among the vast student population in the country. One more institute of the same class will compete within the same small pool of available top quality students and teachers.

It can be argued that a country of India's size can do with another science institute for advanced work. Maybe, but the first priority has to be the upgradation of science education throughout the country. For this, the quality of undergraduate education has to be drastically improved in thousands of colleges across the country. Only then can one expect a steady supply of first rate students and research workers for the top-notch institutes. It has been proved time and again that, as in other spheres of social activity, in education one cannot have islands of excellence in a sea of squalor.

CAPITAL FLIGHT

Mexican Lessons

A STUDY by the International Monetary Fund (IMF), just released, has raised an interesting question regarding the role of resident Mexicans *vis-a-vis* foreign investors in putting pressure on that country's foreign exchange reserves during 1994, immediately after the Chiapas revolt. The massive capital flight around this period triggered the collapse of the peso and led to its steep devaluation. This raises a number of interesting questions regarding the behaviour of people of different countries and regions on the one hand and the kind of policy restraints that are necessary to cope with the consequences of these behaviour patterns on the other.

The peso's collapse had all along been attributed to a sudden withdrawal of investments by foreign investors, apart from a sharp drop in foreign investment in Mexico in 1994. When the US administration cajoled the IMF to organise the massive rescue operation of over $ 50 billion – on a scale unprecedented in the history of the Fund – the presumption was that it was the foreign investors who had taken money out of the country. Controlled as it is by the US diktat, and in response to the fears of the industrial countries that the Mexican troubles may spill over into financial markets of other developing countries, the IMF was forced to fall in line with the US administration's wishes. The IMF managing director has been repeatedly emphasising – and this has also been reiterated in the latest study – that the rescue package of January 1995 for Mexico prevented further erosion of confidence and forestalled contagion of the emerging markets in the western hemisphere and Asia.

The IMF study now suggests that the devastating outflow of capital from Mexico in 1994 was not the work of foreign investors or the outcome of speculative position-taking by them; it had been brought about by Mexican residents. Apparently the Clinton administration now fears probable US Congress criticism that in leading the $ 50 billion international rescue programme, the country had poured a vast amount of money into Mexico at a time when Mexican citizens themselves had little faith in their country's financial future. Of course, it was not that foreigners were not interested in taking their money out of Mexico; they were unable to do so because their funds were locked up in assets whose values were severely depressed or which were non-marketable.

Clearly, the rich in the Latin American countries take the earliest opportunity to resort to capital flight which has given these countries low domestic saving rates. In this

respect, they present a sharp contrast to the people of east Asian countries who are more frugal and nationalistic, which attitudes have formed the basis of their high domestic saving rates. The south Asian countries, such as India and Pakistan, perhaps fall between these two extremes.

The Mexican case also suggests that to curb the speculative proclivities of the domestic rich restraints on capital account transactions particularly with regard to the asset choices of residents, are unavoidable. In other words, countries such as India must necessarily proceed cautiously in regard to capital account liberalisation. While foreign investors may be assured of capital and income repatriation, residents should continue to be subject to restraints on capital transfers. The east Asian countries in fact adopted such measures which, combined with the people's own attitudes, helped to prevent large capital flights. Quite the contrary has been the case of the Latin American countries which, under American pressure, opened up their economies, liberalised their capital accounts and freed their financial systems too much too soon – with results which have been there for all to see.

POLITICS

Bankruptcy of the Congress

A Correspondent writes

BOTH her followers and the media seem to be bent on turning Sonia Gandhi into another Mahatma Gandhi, attributing to her the powers that Mohandas Karamchand enjoyed in dictating the course of Congress history in his days even when he chose to withdraw into seclusion. The latest 'tamasha' in Amethi, where she went ostensibly to distribute wheelchairs to the physically handicapped in memory of her husband, is being made out to be a historic event by the newspapers. It is all because the usually taciturn lady from 10 Janpath chose to verbalise her misanthropic demeanour at a rally in Amethi by complaining that even after more than four years, the probe into Rajiv Gandhi's assassination was being conducted at a very slow pace.

The anti-Rao racketeers among Congressmen, ranging from the Arjun Singh-N D Tewari splinter group of the disgruntled fence-sitters within Rao's Congress Party, are now discovering profound meanings in Sonia's speech in order to bolster up their pre-election strategy of quoting her words at election meetings. From now on, every frown or scowl by her will be interpreted as her opposition to Narasimha Rao for his failure to punish her husband's killers.

But Sonia Gandhi is not likely to move beyond such occasional verbal expressions of pique (as at Amethi) or peevish gestures (like refusal to attend meetings where Rao is present). She is fully aware of the trump-card that Rao possesses – the threat to expose her husband's involvement in the Bofors scandal. She, or whoever is advising her, should know that it is not only the Rajiv assassination case that is lumbering along, but also the Bofors case in which the accusing finger points at Rajiv, his family and cronies. If Sonia demands that the killers of her husband should be punished, the Indian people have also the equal right to demand that the killers of the 3,000 Sikhs in Delhi in 1984 must be brought to book. Sonia has never cared to sympathise with the relatives of these victims. The purely self-centred interests of her and her family in the Rajiv assassination case is being sought to be turned into a national tragedy by the sycophants in the Congress who are desperately looking for some figurehead to lead them to victory in the next general elections.

The bankruptcy of the Congress is evident from its urge to woo Sonia Gandhi – or even her children – in continuation of the old dynastic Nehru legacy which made it choose a political greenhorn like Rajiv Gandhi as prime minister. The prime ministership of Narasimha Rao may be looked upon as a freakish departure from the Congress tradition. Rao has to blame himself for ruining the chance that he was offered to prove his worth as a Congress prime minister coming for the first time from the south and from outside the Nehru family (if we leave out the brief tenure of Lal Bahadur Shastri). His utter incompetence in running the country has reduced him to a butt of ridicule both within and outside India. If his predecessor Rajiv Gandhi, led the country rushing on a disastrous course by his unmitigated foolhardiness, Rao has allowed India to reach the brink of that course by his shilly-shallying. No one from among any of the present Congress leaders – whether a Sonia Gandhi-backed Arjun Singh, or a Narasimha Rao trying to hold on to power (even with the tacit support of the 'Sangh parivar') – can reverse the process. None of the disputing Congress factions is seriously committed to a fundamental change in the economic and political policies. Both are obsessed with the sole objective of capturing power at the centre.

Given this nature of Congressmen today, it would be highly irresponsible for the Left to support any of the Congress factions in the coming elections. In the ongoing debate between the Left and the National Front on the choice of allies, the Left should be wary of striking any alliance with Congressmen (whether belonging to the Arjun Singh-N D Tewari camp or others) who are hobnobbing with the lady in 10 Janpath. By having anything to do with them, the Left would be legitimising the revival of dynastic rule.

TWENTY YEARS AGO

EPW September 6, 1975

A steady transfer of land from small landholders to big farmers is going on in the Kulaba district of Maharashtra. Reports have it that at least 20 per cent of the small landholders have thus lost their land. While orders have been issued to various panchayat samitis to conduct surveys in their areas to assess the magnitude of this problem, no such surveys have yet been carried out.

Kulaba is a relatively fertile district. Consequently, acquisition of the cultivable land of the small farmers is an attractive proposition for the wealthier and bigger farmers. Such acquisition is facilitated, protective laws notwithstanding, by the sheer poverty of the vast majority of the people there. The predominance in the population of marginal farmers is reflected in the fact that 51.6 per cent of all farmers own less than 1 hectare (2.5 acres) and their holdings account for only 10.6 per cent of the total cultivable land.

These small farmers are perennially in debt – not for production purposes, but for subsistence consumption. Government and semi-government bodies will give loans for agriculture – for purchase of bullocks, water, fertilisers, insecticides, seeds, etc. But quite often loans taken for agricultural purposes are used by the poor farmers for consumption. These institutional sources have thus gradually been closed to the poor farmers who have turned once more to the local moneylenders. Often, the moneylender is preferred also because the procedural complexities of obtaining loans from official and semi-official bodies, and the conditions of their repayment, are beyond the capabilities of the poor farmers. The transactions with the local moneylender are free of such complications. They are illegal or extra-legal.

Though, in the land records, the land may be shown as being still with the poor peasant, once he borrows from the moneylender, the moneylender becomes *de facto* owner of the land. Indeed, there are instances of land worth Rs 15,000 per acre passing into the hands of the moneylender for as little as Rs 1,000 or Rs 2,000. And land which has been mortgaged to the moneylender remains with him for years on end – thanks to the exorbitant interest rates on the loans which effectively prevent the poor farmer from getting around to repaying the loan amount itself. In Murud taluka, a moneylender in Wavdungi village has appropriated land of 10 'gawalis' (milk vendors); in Talekha village, about 21 acres of land of small farmers has been illegally acquired by the village patil himself in collaboration with another large farmer. In Panvel taluka, in Deharan village, lands originally belonging to the Adivasi-Thakurs have been illegally acquired by a moneylender.

ASSOCIATED CEMENT COMPANIES

Buoyant Market

ASSOCIATED CEMENT COMPANIES (ACC), incorporated in 1936, is one of the largest producers of grey cement and refractory products. The company has 11 cement plants located in nine states catering to markets spread throughout the country. With a current installed capacity of over nine million tonnes, 120 warehouses and depots and a network of over 10,000 dealer outlets, ACC is one of the largest companies in the world. Structural fabrication and production of heavy machinery are other activities of the company.

The company recorded net sales of Rs 1,776 crore for the year ended March 1995, up by 29 per cent over Rs 1,376 in the previous year. Total income rose by 28 per cent from Rs 1,409 crore to Rs 1,803 crore. There was a fall of 13 per cent in other income which came down from Rs 44 crore to Rs 38 crore. Provision for interest and depreciation increased by 23 per cent and 21 per cent, respectively. Provision for taxation was Rs 50 lakh against nil tax provision last year. These increases notwithstanding, the company closed the financial year with a net profit of Rs 144 crore, up by 138 per cent from Rs 61 crore in the previous year. A dividend of 50 per cent has been declared against 30 per cent.

The company sold 10 million tonnes of cement in the year under review, a rise of 14 per cent, against 8.67 million in the previous year, out of which 1.3 million tonnes were produced by other manufacturers and marketed by ACC. While cement sales contributed Rs 1,600 crore, ACC traded Rs 270 crore worth of outside cement. ACC owns 11 cement plants and markets the cement of four other cement plants. The company has been trading mainly in cement produced by Tisco and Tata Chemicals. It has also lent its brand name to a mini cement plant.

The refractory subsidiary recorded a turnover of Rs 111 crore for the year under review compared to 70 crore, an increase of 57 per cent. ACC's refractory business accounts for 4 per cent of its turnover. The refractory is today the largest castable producer in the country, apart from being the exclusive producer of brown tabular alumina and magchrome bricks sold as Pertlex ACC bricks to the cement industry. Production of Pertlex ACC bricks was under a technology transfer agreement with Refratechnik Gmbh, Germany. The company also commenced production of a new generation of tundish coating material for the steel industry under a licensing agreement with Intocast Ag of Germany, a renowned world leader in this field. The consultancy division too recorded a growth of 57 per cent to generate an income of Rs 33 crore.

The capacity of the one million tonne per annum clinker unit at Gagal which started production from September 1994 has gone up to two million tonnes per annum. The one million tonne per annum clinkering unit at Kymore-Mehgaon has commenced production from May this year. The cement grinding, packing, and loading plant at Kymore is being modernised and will be operational before the end of 1995 with a capacity of over 1.2 million tonnes. The first phase of the project for capacity balancing and expansion of Madukkarai Cement Works was completed during the year under review.

The company successfully completed 15 years of its operation, maintenance and management contract of the 1.2 million tonnes per annum cement plant at Yanbu, Saudi Arabia. Production in excess of the guaranteed level for the fifth year in succession enabled the company to earn a maximum bonus of Rs 1.25 crore. The contract has been extended for a further period of three years commencing March 1996 through an MOU signed with the company. Yanbu Cement Company is building a new 2 million tonnes unit with the maintenance, management and operation having been given to ACC for an initial period of three years.

The proposal for setting up a cement plant in Sizu district of Meghalaya has been cleared and the company is waiting for the green signal from the environment ministry. Dominating the north-east market as well as export to Bangladesh seem to be the rationale behind setting up the plant. The north-east has a scarcity of cement plants mainly because of lack of limestone deposits, the primary raw material required, the problem being compounded by transportation bottlenecks. ACC's plant is being set up in a region which has adequate limestone deposits.

ACC's power plant, the largest in the cement industry, became operational from this April at the company's Wadi works in Karnataka. The new generator set supplied by BHEL has a three-stage bleeding system and is equipped with regenerative low and high pressure heat exchangers for increasing thermal cycle efficiency. There is also a load management system which helps optimise use of various power sources.

ACC has entered into a technical collaboration with Nihon Cement, one of the largest cement companies in Japan, for the manufacture and supply of clinker pre-grinding mills and clinker pre-grinding systems. ACC is introducing these mills at its own plants and expects to achieve substantial reduction in power consumption and increase in capacity as a result. Clinker pre-grinding is becoming widespread for better productivity. The company proposes to set up grinding units, with a total capacity of five lakh tonnes at an investment of Rs 75 crore in Bangladesh. The units will be fed by the proposed clinker plant to be set up in the South Garo Hills, Meghalaya. The project will be a joint venture, with ACC's equity participation coming through ACC Bangladesh, a wholly-owned subsidiary. Apart from a captive market in Bangladesh, ACC will profit from low labour cost. ACC has formed a joint venture with IDBI and ICICI to market bulk cement through a new company, Bulk Cement Corporation of India. The pilot project, costing Rs 68 crore, will come up in Kalamboli, Maharashtra and will cater mainly to the Bombay markets.

ACC has set off on a range of unrelated diversifications -- metal and mineral mining and high quality alloy steel castings. The new high purity synthetic ferric oxide (SFO) plant of 10,000 tonner per annum at Falta has also started production. SFO is the principal raw materials in the production of hard and soft ferrites and is widely used in the electronic and telecommunications industries. The plant is said to be the first in the world to have a two-way technology configuration from Japan and the US and over 70 per cent of the production is to be exported.

A foray into environmental management and mining has been made and the company plans to form a separate company for gold and diamond mining with five states having been identified for this purpose. It is holding talks with CRA of Australia to set up joint ventures to explore and mine precious metals.

HINDUSTAN CIBA-GEIGY

New Ventures

Hindustan Ciba-Geigy, with diversified interests in dyestuffs and chemicals, pharmaceuticals, additives, polymers, pigments and composites (APPC), and agricultural products, closed the year ended March 1995 with a profit of Rs 122 crore against Rs 15 crore achieved in the previous year. This is attributable to the extraordinary income of Rs 101.14 crore realised from the sale of the company's property at Bhandup to Great Eastern Shipping and its oral hygiene business to Colgate Palmolive early this year. Turnover recorded was Rs 437 crore, up by 6 per cent from Rs 431 crore in the previous year. A dividend of 20 per cent has been recommended.

Export earnings stood at Rs 39 crore against Rs 22 crore. Imports rose from Rs 37 crore to Rs 62 crore. The company closed the financial year with a net foreign exchange inflow of Rs 25 crore. Dyestuffs and chemicals have been largely responsible for the improved export performance.

A growth of 31 per cent was recorded by the dyestuff and chemicals division, with exports being the major contributor. The pharmaceuticals division recorded a sales turnover of Rs 1,288 million reflecting a growth of around 24 per cent over the preceding year. The agriculture products business of Ciba is divided into two divisions: crop protection and animal health. Compared to 1993-94, the

agriculture products division recc lower sales by around Rs 610 lakh, primarily because of industrial relations problems at Santa Monica in Goa. Adverse weather conditions in important states like Andhra Pradesh, Punjab, Maharashtra and Gujarat coupled with effective control over pests had a negative impact on the division's operations. The company also faced competition from the generic manufacturers of Monocrotphos, DDVP and Phosphamidon. The animal health division registered a growth of over 30 per cent over 1993-94.

Sales of the additives, polymers, pigments and composites (APPC) division maintained a healthy trend, recording a growth of 20 per cent. The additives division deals in antioxidants, light and heat stabilisers and other products which are added to substances to increase their life/performance. The division caters to the plastics, rubber, synthetic fibres, lubricating oils for automobiles and paint industries, among others. The company is setting up a manufacturing facility for antioxidants at its Santa Monica works to be commissioned by 1996. The polymers division deals in epoxy resins, hardeners, and polyester resins catering to the needs of metal coating, civil engineering, electrical/electronic, adhesives and automotive tooling industries. The pigments division caters to the requirements of the viscose staple fibre industry and the company is making efforts to identify growth options in co-operation with Ciba-Geigy, Switzerland.

The company sold off its oral hygiene unit, manufacturing Cibaca toothpaste and toothbrushes, to Colgate Palmolive for Rs 130 crore. The division was one of the better performers, contributing about 13 per cent to the company's sales, but being the only product of Hindustan Ciba falling in the category of branded consumer goods, it clearly did not fit in with the rest of the company's product line-up.

The company has shed its workforce by 1,430-1,300 from the Bhandup plant and 130 through the deal with Colgate Palmolive. It has earned Rs 173 5 crore from the two deals, to be used for its proposed expansion in the crop protection business and for launching new chemical, agro-chemical and animal health products. The proceeds will also go towards funding Ciba-Vision, a newly formed eye care products division which will sell contact lenses. Ciba Vision, based in Bangalore, is in the process of introducing Indian consumers to its international range of eye care products, specifically daily-wear conventional soft contact lenses and lens care solutions. Also on the anvil is an entry into the opthalmological products market in India.

Hindustan Ciba-Geigy has launched three crop protection products in the domestic market. Pesticides have a 75 per cent share in the domestic market for crop protection with fungicides and herbicides accounting for the remaining segment.

The company has set up a new plant in Goa to manufacture Tinopal CBS-X, a super brightener for the detergents industry. It has

also set up a joint venture, Ciba CKD Biochem, with the Korean company Chong Kun Dang (CKD) for a $ 30 million project to manufacture Rifampicin, a bulk drug used in anti-TB formulations, at Mahad in Maharashtra. Anti-TB drugs are the pharmaceutical division's second most important products (after anti-rheumatics, including market leader Voveran). CKD will have a majority stake in the new company, with Hindustan Ciba-Geigy holding 41.2 per cent and Ciba-Geigy, Basle, picking up 9.8 per cent.

Hindustan Ciba-Geigy, in association with British Ciba Composites and Naltech, the technology wing of National Aerospace Laboratory (NAL), is to set up the country's first commercial venture to manufacture composites. Composites are substances having high strength to weight ratio, and find use in the aircraft industry and space research laboratories and are fast replacing aluminium on the strength of these attributes. The proposed venture will receive technological support from the British firm based Duxford. NAL will provide land and workshop while Hindustan Ciba Geigy will step in with the marketing support. The thrust will be to tap the emerging aircraft industry in the country and also the defence industries with a large part of production being earmarked for exports.

TUBE INVESTMENTS

Focus on Exports

Tube Investments, the flagship company of the south-based Murugappa group, is one of the largest bicycle manufacturers in the country with a 22 per cent share of the domestic market. The company holds a dominant position in the overseas market, accounting for 65 per cent of the country's total bicycle exports. The company started its first bicycle assembly plant in 1950 in collaboration with Hercules Cycle Motor Company of UK, which was a part of Tube Investments, UK. It has come a long way since then and today manufactures not only all critical bicycle components but also steel tubes and strips, cold roll formed metal profiles and sections, and automotive and industrial chains. The company has the support of its collaborator, Tube Investments, UK, which holds 7 per cent equity, and has gone in for strategic alliances with other European players in France and Germany for marketing support for exports.

The company posted a 17 per cent increase in its turnover in 1994-95. A whopping reduction of 92 per cent in interest costs, down from Rs 16 crore to Rs 1 crore for the year under review, contributed to a healthy bottomline which rose from Rs 9 crore to Rs 27 crore, a rise of almost 210 per cent. An increase in the provision for depreciation and tax by 32 per cent and 54 per cent respectively coupled with a rise of 264 per cent in the payments toward the voluntary retirement scheme did little to dampen the end result.

The company's performance on the export front has been satisfactory with exports having registered a growth of 9 per cent. Export of tubes registered a growth of 39 per cent, with the roll form division registering a growth of 103 per cent. A marginal growth of export of bicycles was achieved in spite of levy of duty in Europe on bicycles imported from GSP countries and stiff competition and a recession in European bicycle market in the first half of the year. Imports rose from Rs 18 crore to Rs 31 crore. Import of capital goods rose from Rs 68 crore to Rs 341 crore, a rise of 400 per cent. Export turnover in 1993-94 was Rs 71 crore, up by 82 per cent from Rs 39 crore in 1992-93. The company widened its export base by exporting boiler tubes to Australia and bicycles to Japan, Italy, South Africa and Myanmar. A dividend of 32 per cent has been recommended by the directors.

The company's cycle division manufactures dynamo lights, hubs, pedals and saddles, both for captive consumption and also for the replacement market. In 1994-95 the company exported over 3,50,000 bikes to France, the UK, Germany, the Netherlands and other countries. The export market is much larger than the Indian market. The total demand potential in the European market is approximately 20 million bicycles, while the demand from the US and Canada is around 13 million and one million, respectively.

The domestic cycles market stands at around 8 million units, of which 80 per cent represents standard machines and 20 per cent specials. The growth in the standard cycles market has been around 2 per cent, whereas the specials market has grown by 15 per cent since 1990. Tube investments manufactures both standard and special bicycles, with the emphasis on the latter. The company has a 55 per cent share in the special segment and 11 per cent in the standard. The company has set up an export-oriented unit for manufacturing and assembling cycles at Paruthipet in Tamil Nadu.

The engineering division manufactures high frequency welded (ERW), cold drawn welded (CDW) steel tubes and cold rolled close annealed (CRCA) strips. It is the largest manufacturer of precision tubes in the country. The thrust on exports was maintained and export of tubes registered a growth of 39 per cent over the previous year. Plans are on the anvil to set up a plant for the manufacture of ERW and CDW tubes. The plant to be operational in the current financial year, will cater to the western region.

Tube Investments completed its CDR issue of $ 50 million in mid-1994 to finance expansion and modernisation activities. The company spent Rs 31 lakh on research and develpoment in the year under review, with efforts being directed to new product development, process and product quality improvement and product and design engineering.

Concept

EDUCATION, PARTICIPATION AND EMPOWERMENT

Studies in Human Development

Prayag Mehta

Hardbound Rs. 300

The present study deals with dropouts and other issues in elementary education, mass movement for adult education, welfare of unorganised workers, employment of people for socio-economic development, youth aspirations for employment, education and development and organisation and empowerment of the poor. The book brings out economic, sociological, psychological and organisational issues in fulfilling the goals of human development.

Prof. Prayag Mehta is the former Director, National Labour Institute and is currently working with Participation and Development Centre.

The annual inflation rate has fluctuated in recent weeks but it continues to be in the single digit, easing to 8.34 per cent in the week ended August 19. Inflow of foreign investment was Rs 2,862.4 crore in the first five months of 1995, which is one-third of the total inflow of Rs 8,646.5 crore in the post-economic reform period. Industry-wise break-up of foreign collaboration approvals indicates that almost half the total foreign investment is in metallurgical industries, power, oil refineries and agro-based industries. Maharashtra and Delhi remain dominant in the statewise distribution of foreign investment approvals, receiving 16.5 per cent and 10.3 per cent respectively of total foreign investment approved. West Bengal has moved up, accounting for 10.6 per cent of the total approved investment.

COMMENTARY

Growing Indo-US Military Ties

Gautam Navlakha

The reported presence of foreign military personnel in Jammu and Kashmir needs to be viewed not in isolation but against the background of the rapidly growing Indo-US military ties, including the augmentation of the US military presence in the Indian Ocean area, joint Indo-US military exercises involving the participation of US nuclear-powered ships and frequent visits of US naval ships to Indian ports.

REPORTS concerning the alleged resignation by Lt General Surinder Singh, GOC-in C northern command, and the subsequent denial by the army headquarters (September 1) are a cause for concern. If it is true that there is disquiet in the army over the presence of foreign military personnel in an area of considerable strategic importance. The government should inform parliament and, through it, the Indian public. People have a right to know the exact status of the so-called foreign military 'experts' in Jammu and Kashmir (J and K) and whether 'finer points of diplomacy' are merely an euphemism for concessions.

It is strange that whereas the presence of foreign military personnel in J and K is seen as compromising sovereignty, not much has been made of the augmentation of the military presence of the US in the Indian Ocean area, particularly the Arabian Sea. Since US national interests dictate the need for this presence why is no question raised about the joint Indo-US military exercises? The last such exercise was held in June this year in which two US nuclear-powered ships participated off Cochin. The exercises also included para-commandos for high altitude warfare. It is worth noting that the first report about the resignation of general Surinder Singh (*Indian Express*, August 31) refers to an unnamed army source saying that though the government of India (GOI) had disallowed US troops access to the army's high altitude warfare school at Gulmarg, they have been permitted to witness and participate in the army movements and possible operation in the mountain reaches of the valley. This means that what the GOI had been reluctant to allow as part of the joint exercise is now available to three countries – the US, Germany and Britain – for the asking. Therefore, the presence of foreign military personnel in J and K cannot be viewed in isolation.

What is also surprising is the lack of public protest at the presence of the US nuclear powered ships capable of carrying nuclear arms. It was the GOI which in an official statement issued on June 8 claimed that the US navy did not carry nuclear arms, and that the exercises were held in international waters. No one pointed out that as a rule the US never denies or confirms the presence of nuclear arms even to its allies. New Zealand's experience provides the evidence. In 1987 the Labour government refused permission to US naval ships to call at its ports during ANZUS exercises after the US refused to either confirm or deny presence of nuclear weapons on board. Therefore, the GOI statement was a lie. Furthermore, the joint exercises off the Indian coast with outside powers underplays one of the most important sources of threat to the region. The US has adopted a bellicose posture *vis-a-vis* Iraq, Iran and any other country doing business with them.

Cause of Instability

It is worth remembering that till the mid-1980s annual reports of the ministry of external affairs and the ministry of defence used to criticise the US naval presence in the Indian Ocean and demand the dismantling of the base at Diego Garcia. In the wake of the Gulf war, the US has upgraded Diego Garcia, deployed ground troops in Kuwait and Saudi Arabia, acquired bases in countries comprising the Gulf Co-operation Council (GCC), and now makes regular port calls to India, Pakistan and Sri Lanka. Regular military exercises are held by the US central command with Pakistan and the US pacific command with Indian armed forces. It is also notable that the US has 15 vessels in the Indian Ocean including aircraft carriers. The US administration is setting up a new 'fifth fleet' for the region to defend US 'security interests' and has acquired in Kuwait and Qatar the right to store heavy weaponry of mass destruction. According to the US defence department, this allows it "to quickly link up personnel with equipment in theatre [of war]".

It is against this background that one has to read the importance of US proposals for India. At a press conference held in New Delhi on June 7 the C-in-C of the US Pacific Fleet Admiral Ronald J Zlatopes told correspondents in the presence of Indian defence officials that the US was exploring ways of increasing the frequency of visits by warships at Goa and Cochin from the Gulf, utilising the services of Indian shipyards for repairs. He added that the US was keen on an agreement for its "naval ships doing repairs in the Mazagon Docks and making Cochin and Goa as permanent ports of calls for the US navy, which has a large deployment in the Persian Gulf". These requests for rest and recreation of the US troops, repair facilities for their naval vessels or entry into high altitude warfare school in India are all part of the US and the EU's strategy to defend their oil supply routes, turn GCC into a captive market, protect the client-states of GCC and dominate the Indian Ocean trade and communication routes. These objectives are contrary to the long-term interests of the countries in the region, specifically India. The Congress and the BJP had backed the Chandrashekhar government when it succumbed to US arm-twisting during the anti-Iraq war in 1990 to allow refuelling of US reconaissance and transport planes. More recently in 1993, US warships detained and searched an Indian merchant navy ship in the Persian Gulf. Further, US treasury secretary Robery Rubin protested at the coinciding of his visit to India with that of the Iranian president in April. There was also a motivated campaign in Germany and the US against Indian exports of chemicals to Iran under the guise of claiming that these exports were meant for 'nerve gas' production. The hypocritical commitment of the US and the EU to nuclear disarmament and non-proliferation of weapons of mass destruction seeks to protect their monopoly and is a recurrent irritant for India. It should be apparent therefore that US military presence or that of Germany and Britain is a major cause of instability in the Indian Ocean. To characterise this as 'friendly' or to pass it off as pragmatism is to lower one's guard against imperialism.

Wrong Target

Despite this, the highest echelons of the GOI argue that since Pakistan is the main threat to India (with China to a lesser degree) then winning over the US and the EU would isolate Pakistan. The coincidence of the Indo-US defence ties beginning in 1990, with the moment of extreme vulnerability of the Indian economy and just prior to the new period of 'illiberalisation' of economy should not be overlooked. Within five years, in January 1995, a defence agreement was

signed between India and the US. All this has been defended in the name of containing Pakistan. Therefore, concessions in the form of military and economic openings are intended to match and neutralise those being made by Pakistan. Thus, the ups and downs in Indo-US ties are related to the current status of ties between India and Pakistan with the US. To cite an example the first meeting of the US-Indian joint policy group, established during US defence secretary William Perry's visit in January, was scheduled for June 20-22 at Washington. India called off this meeting because it was offended by the revival of the US-Pakistan defence consultative group set up in 1980. The remarks of under-secretary Walter Slocombe that the Indo-US bilateral defence ties have to evolve 'gradually' so as not to alter the balance of power in the subcontinent was seen as a rebuff to Indian efforts to develop more substantive security relations with the US. When the ostensible premise governing India's relations with the US remains unachievable, the GOI and parliament are expected to re-evaluate and interrogate the fundamental basis of India's political relations with neighbours and the big powers. Instead, the failure becomes an occasion for adopting a chauvinistic posture *vis-a-vis* Pakistan and other neighbours. In other words the absurdity of upgrading Pakistan as the main enemy and downgrading a global imperial power as source of danger to the region is never questioned. However, the presence of US naval ships in the Indian Ocean, the large deployment of the US ground forces in the Persian Gulf countries with the simultaneous expansion of US economic activity in India will certainly affect us.

Nonetheless, it should be remembered that the concern of the Indian army at the presence of 'foreign troops' is a self-serving argument. Had the army been so concerned at the dilution of Indian sovereignty, it ought to have been the first to raise an alarm at the burgeoning Indo-US ties, which are nothing but one-way appeasement of the US. Equally, if the army was concerned at the violation of national interests then it should have opposed its deployment in any anti-insurgency operation as a diversion of its attention and resources from areas which require urgent redressal. What is more the army has not once condemned the threat posed to Indian sovereignty by the activities of Hindutva brigade which has time and again brought the country to the brink of civil war.

A close look at some arguments of the army shows that such deliberate leaks are in fact meant for enhancement of its authority and additional allocation of resources. For instance, it is claimed that the army has not been utilised adequately in the anti-insurgency operations in J and K, Punjab and the north-east. It is claimed that the army cannot train specialised forces or equip them with the latest weaponry due to 'resource crunch'. Facts, however, suggest otherwise. It is remarkable that whereas the social expenditures by the GOI do not keep pace with the official inflation rate, expenditure on defence is protected. Unlike all other budgetary allocations defence expenditure proceeds from an already bloated base, rising within a decade (1986-87 to 1995-96) from Rs 10,500 crore to nearly Rs 29,000 crore. Indeed, if the army were to cease maintaining hundreds of golf courses all over the country tucked away under the item 'training' it can save crores of rupees and use it for actual training. As for unavailability of better weaponry one can safely assume by looking at the burning down of Charar-e-Shariel that upgrading of weaponry would wreak havoc many times worse.

Besides the army is engaged in anti-insurgency operations in J and K and north-east under a *carte blanche* in the form of the Armed Forces Special Powers Act and the Disturbed Area Act. These two acts make it an extra-constitutional authority. The chief minister of Manipur stated on August 20 that 'Operation Sunnyvale' was undertaken by the army without a 'request' from the state government. Thus, the complaints about 'inadequate utilisation' of the army are hard to believe. What strengthens this perception is the destruction at Charar-e-Shariel which not only resulted in burning of the shrine and one-third of the town but also the escape of twenty 'guest' militants, including Mast Gul, through the army dragnet. The prime minister, passing the buck, claimed that the local army commanders were given 'full authority' at Charar-e-Shariel. However, the refusal to order a judicial inquiry into the incident makes clear that gross dereliction of duty either in form of atrocities or bungling enjoys official protection.

It is disconcerting to see the liberal squandering of public wealth going hand in hand with rise in military spending to suppress social discontent. It is against this background that foreign investments are being followed by the presence of foreign military personnel and increase in military ties with the US. All this calls for a public debate, lest the GOI drags the country into the quicksands of anti-insurgency and anti-Pakistan hysteria while pandering to the growing demands of the imperial powers who are beginning to occupy strategic heights in the country's affairs.

Revamped Public Distribution System
A Field Report from Maharashtra

Madhura Swaminathan

The 'revamped public distribution system' – introduced as part of the government's new economic policies – was to reach all households in the target area and ensure that they had easy access to fair-price shops. How has the scheme worked?

IN 1992, the government of India introduced a new scheme, the 'Revamped Public Distribution System' (RPDS). The objectives of this scheme were to expand and improve the system of delivery of commodities through fair-price shops in certain areas of the country identified as 'backward' areas (such as areas with a concentration of people of the scheduled tribes or drought-prone areas). In areas covered by the RPDS the policy aimed to improve the coverage of income-poor consumers by the public distribution system (by increasing the number of fair price shops by providing all households with a ration card and so on), to increase the range of commodities supplied to ration-card holders and to provide foodgrains and other commodities at prices lower than in the regular public distribution system (PDS). To put this policy in practice, the government of Maharashtra introduced in 1992, a Special Action Plan for 115 tehsils, of which 68 tehsils were defined as 'tribal areas'. The plan included provisions for setting up new fair-price shops, for introducing mobile shops, and for supplying additional commodities such as tur dal (pigeon pea), tea powder, iodised salt, washing and bathing soap to ration cardholders. Special prices and quantities were also announced for the commodities to be distributed in the RPDS.

In May-June 1995, I undertook a small study of the 'revamped' public distribution system in Karajgaon, a village in the Talasari tehsil of Thane district.[1] The tehsil is entirely rural and most of the population are people of the varli scheduled tribe. It is a region with a low density of population. Most households own a few acres of rain-fed land and cultivate one crop annually. It is also an area with very low levels of literacy, particularly female literacy. In 1991, only 11 per cent of women in Talasari tehsil were literate. However, women's participation in the workforce is high, higher than the all-India average. Women in the village were active in cultivation and in other agriculture- and forest-related activities.

Malnutrition among women was widespread.[2] Anthropometric data that I collected show that 53 per cent of the women surveyed were undernourished on the basis of the Body Mass Index.[3]

To recapitulate, an objective of the 'revamped' PDS was to reach all households in the target area and ensure that they had easy access to fair-price shops. A fair-price shop was opened in the village in 1992. the shop is on the main road connecting the village with Dahanu in the south and Umargam in the north-west. The 'revamped' scheme was not universal: of the 42 households I interviewed, nine households did not possess a ration card. For most households, purchases from the fair-price shop were infrequent and small relative to their consumption needs. In the month before the survey, May 1995, only six households had bought rice or wheat from the fair-price shop. Not a single household bought cooking oil, lentils, tea, soap, or salt from the public distribution system.

Based on entries in ration cards for the previous 12 months, I estimated the total quantity of cereals bought from the fair-price shop between June 1994 and May 1995.[4]

These data indicate a low level of utilisation of the PDS. Among the 37 households for which I have complete data, the annual purchase of cereals from the PDS averaged 9.5 kg per person.[5] This figure is lower than the state average, for 1991, of 24 kg per person. In Kerala, the state with the most successful public distribution system in the country, purchases of cereals (rice and wheat) averaged 69.6 kg per person in 1991. Using the ICMR norm of 370 grams a day as a desirable minimum, annual cereal requirements are 135 kg per capita. Among the surveyed households, purchases from the PDS accounted for only 7 per cent of this norm. In short, the contribution of cereals supplied through the public distribution system to total requirements of cereal consumption was very small, and the quantity of cereals bought by families in an area covered by the 'revamped' PDS – introduced as part of the government of India's new economic policies – was actually less than the average for the state as a whole.

In many parts of India, particularly urban India, purchases from fair-price shops have declined in recent years because the price differentials between market prices and ration prices have narrowed. In the Talasari region, however, there is still a substantial price differential between private markets and fair-price shops. The common variety of rice, for example, costs around Rs 5.50 per kg in the fair-price shop and Rs eight in private stores in Umargam, the nearest market. The unit price difference is proportionally higher still for wheat, sugar, cooking oil and lentils. Most people said that they did not buy goods from the PDS because the commodities were not available when they visited the fair-price shop. For those with low incomes, and particularly for manual daily workers whose earnings are irregular, it is difficult to buy foodgrains from the fair-price shops; when workers have the money, the stores have no stocks of cereal, and when they have stocks, workers either do not have the money or cannot afford to buy cereal in bulk. In May 1995, 37 of the 42 households interviewed could not afford to buy the common variety of rice in the market either. Instead, they purchased 'kani' or broken rice at a rate of Rs six to seven a kilo. In other words, because of irregular supplies of grains through the RPDS, consumers paid more in the private market than in the fair-price shop and they did so for a commodity of lower quality.

If the effectiveness of the 'revamped' public distribution system were to be judged in terms of whether it provided all households with an adequate quantity of foodgrain and certain other basic commodities at reasonable prices, it must be judged a failure in Karajgaon village.

Notes

[I am very grateful to Mariam Dhawale, Hemlata Kom, Sanjoy Raut, Sainoo Sutar, Shakuntala and Ramji Vartha for their help during my field visit, and to V K Ramachandran for his advice and comments.]

1 This case study is based on intereviews conducted with 42 households in the three settlements ('padas') of Karajgaon village. I estimated that there were 179 households in the village in 1995. I did not have a full listing of all households. I went to every hamlet of the village and interviewed households in every hamlet.

2 The cereal intake recommended by the Indian Council of Medical Research (ICMR) is 370 grams per day; this is in addition to the other elements of a balanced diet. Preliminary results from my study indicate that the average daily consumption of cereals per capita was about 290 grams; other items of the recommended diet (lentils, vegetables, edible oil, meat, fish and eggs, milk and milk products) were eaten irregularly, if at all.

3 This is based on data for 53 women. The Body Mass Index (BMI) is defined as weight/(height^2); the cut-off norm for identifying undernutrition that I have used is a BMI of 18.5.

4 One problem with the data was that, in some cases, the households said they had not bought the quantities entered in the ration card by the fair-price shop dealer. This problem of 'false entries' needs to be investigated further.

5 If the ten households who made no purchases are excluded, the average quantity purchased was 13 kg a year.

Redressing Water Scarcity

Limitations of Governmental Approach

Abhas Kumar Jha

The ministry of rural development has recently come out with new guidelines for watershed development in areas coming under the Drought Prone Areas Programme and the Desert Development Programme. While they incorporate a more innovative and flexible approach to watershed management, they still continue to neglect important issues including gender-related problems and common property resources.

IN April 1993, the government of India, constituted a technical committee under the chairmanship of C H Hanumantha Rao to go into the technical parameters for inclusion and exclusion of areas from the Drought Prone Areas Programme (DPAP) and the Desert Development Programme (DDP) and also to suggest modifications in the guidelines to streamline the programmes. The report was submitted by the committee (hereafter referred to as the Report) after extensive field visits, receiving memoranda from the state governments, deliberations with a number of experts and nine meetings. The ministry of rural development, in its reponse to the report, has come out with the revised Guidelines for watershed development (hereafter referred to as the Guidelines).

The DPAP can be traced back to 1970-71 when the rural works programme was launched with a view to reduce the severity of drought in the affected areas covering 54 districts along with parts of 18 other districts. The DDP was started in 1977-78 in the light of the interim and final reports of the National Commission on Agriculture which suggested an afforestation and livestock development programme for the hot and cold desert areas. Both the programmes have seen a considerable dilution and shifts in objectives to be achieved. At the core of these programmes is the emphasis on ecologically sustainable development through activities relating to soil conservation, land shaping and development, water resources conservation and development, afforestation and pasture development. However, the programmes were confined to the generation of employment and renumerative work up to the fourth Five-Year Plan when mitigation of scarcity conditions got added as an objective. The mid-term appraisal of the Fourth Plan shifted the emphasis of the two programmes from generation of employment to creation of durable assets. It was the recommendation of the task forces headed by B S Minhas and M S Swaminathan and the 1988 mid-term appraisal of the Seventh Plan which clearly spelled out drought-proofing and control of desertification as the main objectives of the DPAP and DDP. However, in the process "the direction of the programmes got diluted depending upon... the perception of the state governments, spending capabilities of sectoral departments and pressures exerted by different interest groups...DPAP/DDP were perceived to be against the short-term gains .. and pulled away from the integrated approach to long-term drought-proofing of the area." [*Report*, paras 2.17 and 2.20] Thus, the Report finds three major factors responsible for the failure of the programmes: "(1) Poor and ad hoc planning without any serious regard for the watershed approach, (2) An almost complete lack of people's participation, and (3) Weak co-ordination between and lack of integration among' works undertaken by different agencies involved in operation" [*Report*, para 4.1.1]

The net result of all the above factors has been that the progress of these programmes has been chequered, at best. The Report brings out the interesting fact that the areas treated under the DPAP, so far, comes to about five million hectares which is only about 10 per cent of the geographical area of the blocks under the DPAP. The area treated under the DDP accounts for only about 1 per cent of the total area in the selected blocks [*Report*, para 3.2] The Integrated Wasteland Development Programme (IWDP, which is now under the purview of the Watershed Guidelines) has also been marked by poor disbursements and low coverage [see Roychoudhary (1994b) for a discussion of the achievements of the IWDP]. The DPAP has also been criticised on the grounds that the productive assets produced under the programme are often extensions of resource intensive and drought vulnerable development packages. As a result, drought has often intensified and expanded as a result of such ecologically indifferent packages [Rangaswami quoted in Bandopadhyay et al 1986].

The Guidelines, on the basis of the Report, seek to formulate common objectives, strategies and expenditure norms for watershed development within the DPAP, DDP, IWDP, Employment Assurance Scheme (EAS) and Intensified Jawahar Rozgar Yojana (IJRY). A rough estimate of the availability of funds for watershed development in 1995-96 would be:

	(Rs crore)
DPAP	200
DDP	100
IWDP	100
EAS (50 per cent of total funds)	600
IJRY (50 per cent of total funds)	350
Total	1350

This is largely on the lines suggested by the Report (para 4.5.5). A commitment of such a substantial amount of funds for watershed development is, by itself, a major and welcome policy shift. The Guidelines, however, stop just short of bringing the entire gamut of rural employment and area development programmes within its ambit by committing 50 per cent of JRY funds. This would have meant approximately an additional Rs 1,000 crore for watershed development. Equally significant is the acceptance of great flexibility in the expenditure norms of the Guidelines. This has been a long-standing demand of NGOs working in the area of wasteland/watershed development [Roychoudhary 1994b]. The Guidelines do not lay down cost norms for specific activities but instead lay down broad area specific norms for the entire project [*Guidelines*, para 4.6, 4.7 and Appendix II]. This fact is stressed upon by the Report as well (Para 4.7.16]

Problems in Implementation

The implementational structure envisaged by the Guidelines at the district level is somewhat confusing. There will be a number of Programme Implementation Agencies (PIAs) in the district whose job will be to "motivate the gram panchayats to pass the necessary resolutions to make public contributions, conduct Participatory Rural Appraisal (PRA) exercises to prepare the development plans for each watershed, undertake community organisation and training for the village communities, provide technical guidance and supervision of watershed development activities, manage project implementation, inspect and authenticate project accounts, undertake action research to adapt low-cost technologies and/or validate and build upon indigenous technical knowledge, monitor and review the overall project implementation and set up institutional arrangements for post-project operation and maintenance and further development of assets created" [*Guidelines*, para 31] This is a tall order indeed. Given the general state of the technical and institutional capabilities of district level agencies it is almost certain that finding a requisite number of competent PIAs will be next to impossible.

Below one PIA there will be a number of multi-disciplinary Watershed Development Teams (WDTs), each WDT handling 10-12 projects. All members of the community in the watershed area are to be organised into

a registered watershed association which will meet, at least, twice a year to evolve/improve the watershed development plan, monitor and review its progress, approve the statement of accounts, form user/self help groups, resolve differences or disputes between user/self help groups, approve the arrangements for collection of public/voluntary contributions, etc. The day-to-day activities of the project will be carried on by a 10-12 member watershed committee to be nominated by the association. Each project will have a full time paid watershed secretary.

The logic behind such a plethora of agencies is inexplicable. While the association (which is the general body of the community of persons benefiting from the watershed), the committee as the implementational wing of the association and the WDT as an input of technical expertise is understandable, the PIA appears to be a redundancy in the scheme of things.

The administrative structure envisaged by the Guidelines is also inadequate. It is mentioned in passing that the state government departments participating in the programmes shall be subject to the overall supervision and guidance of the DRDAs/Zilla Parishads [*Guidelines*, para 34]. Given the psychology of protecting one's turf by all sectoral departments this will be difficult to enforce. The Guidelines should have made it necessary for each state to form a watershed directorate on the pattern of Karnataka, in which the staff of the various sectoral departments could be deputed purely on a voluntary basis with, perhaps, a generous deputation allowance as an incentive. These persons could then be placed under the administrative control of the chief executive officer of the zilla parishad/DRDA as the case may be.

The feasibility of people's participation in an unequal social setting and, more importantly, of policy mandated' community participation, is largely debatable. A number of studies have pointed out that the success in environmental regeneration at Sukhomajri was, in a large measure, facilitated by the fact that the village was a small largely homogeneous community. Out of a total of 39 families only 2 were Jats, the rest being Gujjars [see Chambers et al 1989, Roychoudhary 1994]. The same experiment when tried in other, less homogeneous communities was less than successful, e g, the village of Lohgarh where the Harijans accused the high caste people of usurping all the benefits.

Chambers et al (1989) have defined three characteristics for the success of community control and management. (1) The village has certain unique geographical and socio-economic characteristics (upland/tribal village, undulating topography, a population of 50-100 families, dependence on wastelands very high, one caste dominant, authority of village elders still intact etc), (2) The gains from organisation are high for both the village elite and the commoners, and (3) A leader willing to run the show for non-monetary gains. The experience of the Joint Forestry Management (JFM) Programme in West Bengal further illustrates the point. The JFM programme in the state has often been hailed as a major success story and a policy model to be followed by all the other states. Arora (1994) has pointed out that people's participation in forest management preceded the introduction of the JFM rules in 1989. There were more than 1,200 protection committees existing in the state before 1989. Moreover the existence of active panchayati raj institutions and the policy of land reforms preceded the introduction of the JFM rules and doubtlessly contributed to the active public participation in the programme.

In this context, the Guidelines appear to set great store to the fact that the watershed associations will approve the watershed plan, expenditures and accounts. This, by itself, means nothing at all as the experience of the JRY has shown. JRY requires the annual action plan of the panchayat to be approved by the general body of the panchayat. In many, if not most, cases the 'Aam Sabha' is either not held at all or, if held then the poor do not or are not allowed to participate. The point is that 'people's participation' cannot ignore the larger socio-economic context.

Neglected Issues: Gender and CPRs

Both the Report and the Guidelines fail to address adequately the critical issue of Common Property Resources (CPRs) in high stress eco-systems. The Report merely states that the treatment plan for the watersheds should "include all categories of lands including . village commons [*Report*, para 4.2 5]. Similarly, the Guidelines mention that the watershed development plan "should specifically outline the problems of and the approach to tackle (amongst other things) CPRs" [*Guidelines*, para 87]. Jodha (1990) has shown that during drought the percentage of rural households using CPRs goes up significantly (range of values were 68-72 per cent in drought years as compared to 25-38 per cent in non-drought years). Similarly, the CPR contribution to total sustenance income (excluding relief and credit) in drought years ranged from 42-57 per cent as compared to 14-22 per cent in non-drought years. The complementarity of CPRs with Private Property Resources (PPRs) has also been shown to be significant in dry regions through the sustenance of farm animals (as a source of forage and fodder) and by filling resource and product gaps faced by PPR based systems. It has also been found that despite large scale depletion of CPRs the rural poor continue to depend on them. Traditional farming systems in dry areas partly derive their stability and viability through CPRs [Jodha 1986]. In this context the protection and regeneration of CPRs should clearly have been the point of central focus in the Guidelines, which is clearly not the case. A related issue is that of the sharing of usufructory benefits. The failure to define, establish and publicise the rights to the trees and the procedures for marketing and allocating benefits has been seen to be crucial in the failure of community forestry programme [Chambers et al 1989: 167]. Both the forest policy (GOI 1986) and 'the National Conservation Strategy and Policy Statement on Environment and Development' (GOI 1992) assign an important role to a clear and unambiguous definition of unsufructory rights. This is another important issue which remains largely unaddressed by both the Report and the Guidelines. The latter require that those villages be given priority in selection in which a resolution is passed that the benefits from CPRs and other community assets created under the programmes will be shared with the weaker sections of society [*Guidelines*, para 25(d)]. The capacity of the poor to get such a resolution enforced and the willingness of the bureaucracy to enforce it is highly questionable.

Both the Report and the Guidelines totally ignore the crucial role women can play in watershed development. This is an extremely important omission. The Guidelines only require that 'adequate representation' be given to women in the watershed development committee [*Guidelines*, para 37]. Women most often lose out in benefits from forests and forest activities. They are the main collectors of fuelwood, fodder and minor forest produce. The Second Citizen's

Report on the State of India's Environment states, "Probably no other group is more affected by environmental destruction than poor village women. Every dawn brings with it a new march in search of fuel, fodder and water" [CSE (1987) quoted in Kumar 1992]. See the latter for an interesting discussion of the women's movement *vis-a-vis* the environment. See also Geeta Sen's article in Sen et al (1994) for a feminist perspective on the issues of environment, population and development]. Several NGOs have shown the way in making women self-reliant through programmes for environmental regeneration. Community involvement also appears to be greater in programmes with greater female participation [see Vohra (1990) for the experiences of MYRADA, Banwasi Sewa Ashram and the Rural Development Association in this regard] The Guidelines needed to take a much more aggressive and pro-active stand on the gender issue by requiring that a minimum of 50 per cent of watershed secretaries be women and by assigning certain specific tasks like the raising of nurseries, seed banks, and fuel and fodder banks exclusively to women.

Difference in Emphasis

There are several subtle, yet important, divergences between the Report and the Guidelines The Report gives the eminently sensible suggestion that once the blocks to be taken up under the programmes are selected, different micro-watersheds of area not exceeding 500 hectares may be identified using remote sensing techniques [*Report*, para 4.2.6]. Using the severity of soil erosion and depletion of vegetal cover as the selection criteria, all the micro-watersheds can be prioritised in a manner such that each village in a block is covered within 10 years In case of similar resource degradation in more than one micro-watershed the report suggests that scarcity of drinking water, larger population of SC/STs, preponderance of common lands and watersheds where actual wages are significantly lower than the minimum wages may be made the selection criteria [*Report*, para 4.2.7]. The Guidelines do not refer to the use of remote-sensing maps at all, and instead reiterate the latter four criteria of the Report and, in addition, introduce contiguity to a previously taken up micro-watershed as a selection criteria [*Guidelines*, para 26]. The use of the more objective criteria of remote sensing evaluation of soil erosion and depletion of vegetal cover, particularly when the technology is readily available, for initial screening and prioritisation of the micro-watersheds would be significant in resisting the local level political pressures for spreading the resources available thinly over a number of villages and constituencies.

Equally significant is the criteria for selection of blocks under DPAP/DDP. The Report suggests the use of the moisture index (MI) as a criterion for coverage and allocation. The MI = (P–PE)/PE × 100, where P = Precipitation and PE=Potential Evapotranspiration. On this basis the following criteria is suggested:

MI	Programme Permissible	Eco-system	Irrigated Area (Percentages)
<–66 7	DDP	Arid	50
–66 7 to –33 3	DPAP	Semi-arid	40
–33.3 to 0	DPAP	Dry-sub humid	30

[*Report*, paras 4 7 2 and 4 7.7]

The Guidelines say nothing at all on this subject.

Similarly, the entire issue of the conjunctive use of surface and groundwater fails to find mention in the Guidelines. The Report lays great stress on this aspect and even gives a negative list of irrigation structures, i e, those whose construction is to be discouraged in the programme areas (para 4.4 2) It is true that the data on groundwater extraction and recharge are highly inaccurate [Moench 1992] However the groundwater potential as assessed by the various state level groundwater agencies would be an important variable in the selection of the micro-watersheds in that the 'grey' and 'dark' zones should be high priority areas. Equally strange is the fact that the concept of water budgeting fails to find mention in both the Report and the Guidelines. A water budget must necessarily form a part of every micro-watershed plan.

The critical question to be asked is what do the success stories tell us? We now have a number of well documented successes in this field such as Sukhomajri, Ralegan Siddhi, Jhabua, Kabbalnala and Adgaon. The problem is that many of these experiences are situation specific; the beautiful but not-replicable variety. Often a dynamic leader has been the crucial catalyst; whether it is Annasaheb Hazare in Ralegan Siddhi, Vijay Borade in Adgaon or P C Mishra in Sukhomajri. The Guidelines clearly seek to build on the experiences gained so far, both by the NGOs and government agencies An interesting innovation in this regard is that one of the activities permitted by the Guidelines as a community entry-point activity is repairing a village temple (para 70). This clearly draws on the experience of Ralegan where one of the first activities undertaken by Anna Hazare was the renovation of the Baba Yadav temple [Meeta et al 1994]. Another innovation is allowing exposure visits to successful enterprises for members of the user groups to be borne out of the administrative costs (Para 75). It can be hoped that gradually an active information network will be built up with exchange of views through various fora including, perhaps, a newsletter.

The Report and, even more so, the Guidelines are extreme departures from usual government policy statements. The manner in which both the documents seek to build upon the experience gained so far in watershed development, especially the indigenous methods of 'drought coping', is extremely praiseworthy. The stress on 'shramdaan', the focus' on community participation and empowerment and the flexibility in expenditure norms are all significant innovations. What we have sought to show here is that there remain vital omissions and shifts in focus and, more importantly, there are certain inherent limitations and contradictions of policy mandated people's participation. Nonetheless, the spirit behind the two documents is admirable, based as it is on delegation and trust in the ultimate beneficiaries of the programmes.

Left Front and the Police

Case of Bhikari Paswan

Biren Roy

It has become customary for the Left Front government to defend every action of the state police, however brutal and indefensible. This is making it possible for the Congress, and the Youth Congress leader Mamata Banerjee in particular, to emerge as champions of human rights.

THE mysterious disappearance of Bhikari Paswan, reportedly from police custody, has raised serious questions about the role of the West Bengal state police and, by extension, of the Left Front government. The sequence of events was as described below

Bhikari Paswan was a casual worker employed in the Victoria Jute Mill, Telenipara, in Hooghly district, owned by R J Brearley, a British citizen who generally resides in London There was enough discontent among the workers for the management's default in payment of PF dues, arrear bonus and wages which totalled about Rs 18 crore The workers were demanding that the weekly wages and arrear bonus due to them be paid before the Puja holidays that were to start on October 22, 1993. There were a number of unions in the mill affiliated to different trade union centres, but none of the unions paid serious attention to the workers' grievances Discontent brewing from before burst into the open over the non-payment of workers' dues which were to be paid on October 17, 1993 The whole wrath of the workers was directed not so much against the management as against all the unions whose local offices were smashed and leaders were attacked Some unions lodged an FIR with the local police outpost. As a consequence seven workers were arrested On the morning of October 21, about a thousand workers assembled at the local police station and demanded the release of their colleagues, but the police refused to release them There was a scuffle between the agitated workers and the police. As a result, several workers were injured and a police constable, Balaram Singh, who was seriously injured, later succumbed to his injuries in hospital Following this, a case was registered and some workers arrested. Bhikari Paswan's father filed a writ petition on November 22, 1993 before the Calcutta High Court in which he alleged that his son (Bhikari Paswan) had been picked up by the police on the night of October 30-31; since then he had not been produced before any court and had remained untraced. The police denied the allegation and stated that Bhikari Paswan had not been arrested at all

But according to the Association for Protection of Democratic Rights (APDR) which also filed a habeas corpus petition before the Calcutta High Court on November 17, 1993 and also sent a fact-finding team, 22 persons had been arrested. Bhikari Paswan was one of them and his name appeared in the list of arrests (serial number 19) which was later tampered with by the police and the name of Nizam was written in Bhikari's place In support of its contention, amongst other evidence APDR has cited the report of Central Forensic Science Laboratory which, *inter alia*, states

> A careful microscopic examination reveals that the existing blue carbon writings reading 'Nizam' has been written over some original blue carbon writings which when deciphered read as "Be - a - e" The letter at the second dash position could be small 'h' or 'l' The letter at the 3rd dash position after small letter 'a' could be small 'r' The two straight strokes have been used to prevent the reading of the final small English letter 'e'.

After recording some evidence, including that of the police, the division bench of the Calcutta High Court, passed an order to the effect on June 8, 1994 that "it is necessary to investigate the matter by an independent agency and so we direct the CBI to report whether Bhikari Paswan was at all arrested or taken into custody of police on the aforesaid date". The aforesaid date means the midnight of October 30-31, 1993

The CBI made its enquiry spread over about a year and recorded evidence of concerned persons and submitted its report before the high court on May 13 this year. The report concluded.

> In the light of the facts which have come to light during the investigations, it can be concluded that Bhikari Paswan was indeed picked up by the police party from his residence on the night of 30/31 10.1993 at about 12.30 am His whereabouts since then are not known
>
> Sharad Kumar
> SP CBI
> SIC-II/New Delhi

Another intriguing aspect of the whole affair is that Bhikari is reported to have been a stool pigeon in the pay of the local police.

The CBI report is being contested by the West Bengal state government and the case is now *sub judice*.

It may be asked whether the central police is more dependable than the state police. In this connection, it should be pointed out that all important enquiries in the country have been undertaken by the CBI and the people in general have more confidence in a CBI enquiry. The CPI(M) which heads the Left Front government in West Bengal has supported CBI reports in other states, such as UP regarding atrocities by the UP government during Uttarkhand agitation and also in the case of the murder of the Sikhs in Pilibhit. But it has thought it fit to contest the CBI report in West Bengal where it is in power It has become customary with the Left Front to defend all actions of the police in the state. But this has caused resentment among a wide section of the democratic people. It cannot be ruled out that the Bhikari Paswan case was one of the factors responsible for the defeat of the Left Front candidates in recent civic elections in Chandan Nagar and Chinsurah, areas adjoining to Telenipara where Bhikari Paswan's mysterious disappearance took place.

For the wrong attitude of and wrong steps taken by the Left Front, the Congress(I), especially the Youth Congress(I) leader Mamata Banerjee, has been able to reap political advantage. She has emerged as a great defender of human rights. Nobody can take exception to her giving financial and moral support to the family of Bhikari Paswan and helping the family to conduct the case. But it is an irony of history that the Congress(I) which was responsible for the massacre of political activists inside jails and outside during its regime in West Bengal in 1970s and whose central government imposed the internal emergency in 1975, when trade union and other democratic rights were seriously curtailed, has today become the defender of human rights. It was during the Congress(I) regime in West Bengal that the mysterious disappearance of Saroj Dutta, a well known poet and journalist, took place. Public memory is short and many young person today are not aware of these incidents. The Left Front led by the CPI(M), because of its own role as a violator of human rights, has failed to expose the role of the Congress(I) at this juncture and is on the defensive.

However, it is not too late. There is no point in defending the role of the police in the disappearance of Bhikari. The Left Front government should suspend the police personnel guilty for the disappearance of Bhikari Paswan and should pay adequate compensation to his family. Such steps will take the wind out of the sail of Mamata Banerji and other Congress(I) leaders and help restore the confidence of the democratic people in the Left Front government.

Such steps are not only justified but also urgently called for.

Postponement of Tamil Nadu Panchayat Election

Centre's Role

Girish Kumar

The Tamil Nadu Panchayat Act, 1994, instead of encouraging people's participation through local representative bodies, provides enough grounds for bureaucratic intervention and state control.

THE constitution (seventy-third amendment) act, 1992 has accorded a statutory position to the panchayat institutions. It has also ensured that once a panchayat is constituted under the statute, it cannot remain dissolved for more than six months. However, no deadline has been set for holding the first election for them under this act. In other words, this matter has been left entirely to the sweet will of the state governments. Using this lacuna in the act, many state governments have not even bothered to announce the election schedule for their panchayat raj institutions (PRIs). This shortcoming is particularly glaring in the case of states like Tamil Nadu where panchayat elections are long overdue. In fact, during the last three decades, starting from 1965, panchayat elections in Tamil Nadu have been held only four times, the last election was held in 1986, and prior to that in 1970.

Centre's Complicity

Aware of this shortcoming in the act as well as the state governments' reluctance (leaving aside notable exceptions) to devolve power below the state capitals, the union ministry of rural development announced late last year that funds for rural development programmes will not be given to those states which have not initiated any action to hold the panchayat election under the act. The prime minister also reiterated this warning while addressing a meeting of his party workers in New Delhi on January 30 this year. Yet the Tamil Nadu government maintained studied silence over this issue.

Came February, and the union rural development ministry announced withholding of rural development funds to Tamil Nadu involving over Rs 500 crore. Within hours of this announcement, however, the prime minister intervened to bail out the Tamil Nadu government. Although no official explanation was given for this volte-face on the part of the prime minister, it is not difficult to understand the reasons for it.

The Congress Party has almost been routed in Karnataka and Andhra Pradesh and its prospects are equally bleak in Kerala, thanks to the misrule and high-handedness of the recently replaced chief minister Karunakaran. Indeed, leaving aside Haryana, Punjab and Himachal Pradesh in the north-west, Orissa in the east and Madhya Pradesh in the centre, the Congress has already been dislodged from power in as many as 10 major states, including Gujarat and Maharashtra – until recently considered to be its bastion. Not surprisingly, the prime minister is more concerned about the prospects of his party in the next parliamentary election than the revitalisation of the panchayat system in a state like Tamil Nadu whose track record in this sphere has been dismal. And this, notwithstanding the fact that if a single party could be held responsible for the decline and fall of the panchayati system in the state it is the ruling AIADMK.

AIADMK's Delaying Tactics

As is well known, when M G Ramachandran broke away from the Karunanidhi-led DMK in 1972, he formed the AIADMK, largely enrolling the frenzied members of his fan clubs as its cadres. To these cadres MGR was a living idol, such was the popularity of the silver-screen hero turned politician. Rising on the crest of his popularity, duly strengthened by the rowdyism of these cadres, AIADMK has won so far four assembly elections in Tamil Nadu, twice in alliance with the Congress. Notwithstanding these victories, MGR had realised that with the support of such lumpen elements he would never be able to win elections for the institutions of local self-government, be it a municipality or a panchayat. After exhausting all conceivable arguments – even as frivolous as shortage of electricity to print electoral rolls, water scarcity and giving of serial numbers to houses constructed by state housing board, etc, for not holding elections of either panchayats or municipalities – he found no other option but to hold elections for local bodies in 1986. The result, as MGR had apprehended, was disastrous for the AIADMK as the DMK emerged victorious. In fact, after gaining the control of local bodies, it was easier for the DMK to win the Tamil Nadu assembly elections in 1989.

Although in her party's manifesto for the 1991 assembly elections Jayalalitha promised to hold local bodies election within six months if her party was again voted put to power, four years of her rule have passed with these local bodies remaining under the control of bureaucrats.

It also needs to be mentioned here that the AIADMK voted against the 73rd amendment in parliament, stating that it implied an infringement of the states' powers. The Tamil Nadu assembly ratified the amendment when all other non-Congress-I ruled states had approved it. Ironically, this party, as an alliance partner of the Congress during Rajiv Gandhi's regime, had supported the 64th amendment which indeed was a real encroachment on the autonomy of the states.

Again, just two days before April 24, 1994 which had been stipulated time as the last date for either amending the existing panchayat acts by incorporating in them the provisions of the 73rd amendment act or to frame a fresh legislation on the subject, the Tamil Nadu government came out with its new panchayat act. The state election commission was also constituted in June last year. But a precise schedule was never announced for holding the panchayat elections.

Indeed, apprehending repetition of a 1986 like performance by the opposition parties, particularly the DMK, in panchayat election, the AIADMK government is again resorting to all sorts of subterfuges to postpone them as long as possible. The latest initiative of the AIADMK government clearly bears it out. An amendment to the state's panchayat act, 1994 providing reservation for the backward classes at all levels of PRIs, was brought forward by the state government on the last day of the budget session of the state assembly. Although well aware that this piece of legislation could not be passed on the same day, the government cleverly pressed for its adoption to which the speaker naturally, did not agree. Now given the fact that the next session of the assembly will be held in July, this clearly was well-planned device of the state government to wriggle out of the commitment made through the governor's address to hold the panchayat elections in June.

It is not only that Jayalalitha is reluctant to face the electorate on the local issues, she is also distrustful of the institutions of rural local governance. A close scrutiny of some of the important provisions of the Tamil Nadu panchayat act, 1994 reveals this fact.

Anatomy of Tamil Nadu Panchayat Act, 1994

The Tamil Nadu assembly passed a new act, the Tamil Nadu panchayat act, 1994 which came into effect from April 24, 1994 replacing the Panchayat Act (1958). It has 262 clauses put under 13 chapters.

Gram Sabha (GS)

Under chapter II (clause 3) it is stipulated that the GS will meet at least thrice a year to approve the village plan, annual budget and also review the progress of the implementation of schemes entrusted to the village panchayat. But there is a rider which says there could be a gap of maximum six months between two such meetings. If this provision is availed for any reason whatsoever then in a quick succession three GS meetings could be convened in the remaining six months. What then would be the end-result is not even an intelligent guess. This reflects a casual attitude towards the GS and lack of concern for making it truly an organ of participatory democracy at the grass roots level.

Powers and Functions

The functions and powers of village panchayat, panchayat union council (PUC),

at the block level, and district panchayats (DP) along with their properties are enumerated under chapter VIII which has 56 clauses.

The village panchayat is entrusted with the construction, repair and maintenance of all village roads, bridges, culverts, road-dams, drains, burial grounds, wells (sinking and repairing), lighting and cleaning of streets and public places, cleaning of latrines (both public and private), opening and maintenance of markets, parks, sport clubs, literacy centres as well as centres of physical culture and also centres for imparting social education. Besides, 'such other duties as the government may by notification impose' (sub-clause of clause 111). This last provision also applies to PUC *vide* Section 112(o).

In short, all (municipal) regulatory functions are entrusted to the village panchayats. At the same time the act clearly says, 'provided that nothing in this clause shall apply to water supply for non-irrigation purpose (read drinking water) and to sewage' [clause 111 (i)] But it has no role whatsoever in the field of primary education, health and public distribution system

The PUCs are also supposed to carry out most of these construction, repairing, opening and maintenance works pertaining to several items given above but only those which are classified as panchayat union roads, bridges, etc. In addition, PUCs are given the task of establishing and maintaining dispensaries, maternity and child welfare centres, 'dai' (midwife)-service, houses for poor and orphanage, elementary schools. They have also been given the responsibility of training and employment of vaccinators, etc

The act provides for subsidies to rural medical practitioners and of grants to privately managed elementary schools However, the norms for fixing off the amounts of these subsidies have such payments? It is not been spelt out The act is equally vague about the promotion and encouragement of cottage industries (sub-clause (n)) and also regarding the removal of congestion of population and the provision of house-sites (sub-clause(e))

The duty of district panchayat is to advise the state government 'on all matters relating to the services maintained by and all development works undertaken by all VPs, PUCs' as well as the line departments and agencies placed under the administrative control of the government [Clause 163 (2-a)] Interestingly, sub-clause (2-c) of this clause also empowers the DP to keep a watch on the 'progress of measures undertaken by lower and intermediate level panchayat bodies and government departments'. But what action the DP should take if the progress is found to be unsatisfactory has not been specified.

The appropriate rules and regulations for the day to day functioning of PRIs are yet to be framed Moreover, the contents of the eleventh schedule of the constitution (73rd amendment act) has been copied out *in toto* and appended as schedule IV of the act (clause 257), without any attempt made to distribute the functions among the PRIs at various levels. Under the given circumstances, will it not be too much to entrust the PRIs with the task of so-called decentralised planning? But the clause 240 of the act says that VPs and PUCs will prepare annual development plans 'before such date and such form as may be prescribed'

Government Control

According to clause 204 of the act, if the collector is 'satisfied' with the written submission of a chairperson of a VP/PUC/DP that owing to the non-cooperation of elected members he/she was not able to perform his/her duties, the collector by notification can vest all powers of the concerned panchayat body in its chairperson but for a maximum period of six months. The act does not offer any scope for an explanation to be given by the elected members against whom the complaint is lodged This means the collector can apply his sense of judgment even without knowing the other side of the story

Such vague wordings, one fears, might give rise to sycophancy among the ordinary elected members of panchayat body as well as misuse of power by the collector In any case, this amounts to appeasement of the chairpersons of panchayat bodies at the cost of democratic rights of ordinary elected members

This becomes all the more clear when we look at clauses 205, 207 and 209 of the act which read that if a complaint of a similar nature is made against the chairperson of a panchayat body (VP/PUC/DP) by a two-thirds majority of its elected members, the concerned chairperson will be given a chance to explain his/her position before the collector. However, for the removal of deputy chairpersons of PRIs the collector's power is all the more discriminatory (clauses 206, 208 and 210). It also needs mentioning that the chief executive officers of PRIs can forbid access to the records of PRIs to the elected members 'for reasons recorded in writing' (clause 81).

Besides, clause 232 exempts both, the elected representatives as well as the officials of PRI, from legal action for any alleged neglect or default in the execution of any act 'if such act was done, or such neglect or default occurred in good faith'. This provision is liable to be misused by corrupt PRI elected representatives and executives as well. Finally, under three more clauses 214, 215 and 216 of the act the government has armed itself with arbitrary powers to dissolve the panchayat bodies.

On the whole, it appears, that the Tamil Nadu government is apprehensive about the proper devolution of power below the state capital. In first place, the act does not offer much hope to encourage people's participation in the decision-making process under the aegis of PRIs At another level it discriminates against ordinary elected members in their relationship with the chairpersons of PRIs And finally, it provides enough grounds for bureaucratic intervention and control. With such glaring shortcomings in the act, which could easily erode the functional autonomy of panchayat bodies, the upcoming PRIs under the new act could become anything but institutions for local self-governance – a tall claim made in the preamble of the Tamil Nadu panchayat act, 1994

From Plantation Slavery to Penal Slavery

Vijay Prashad

As fewer Americans find permanent, well-paying jobs with benefits, the working class will be pleased to find work of any kind; building prisons is not a bad idea and working in 'correctional centres' seems better than starving.

> A political event is reduced to a criminal event in order to affirm the absolute invulnerability of the existing order
>
> – Angela Y Davis, *If They Come in the Morning. Voices of Resistance*, New York, 1971

ON November 19, 1993, the US Senate passed the Violent Crime Control and Law Enforcement Act (the 'Crime Bill') at the initiative of president Bill Clinton and the Democratic Party. Among other provisions, the act allowed 14-year-olds to be tried in court as adults, it raised the number of federal death penalty offences from two to 60, it provided monies for 1,00,000 new police officers and it allowed the judiciary to use 'secret evidence' in the expulsion of 'suspected alien terrorists'. The act, politicians argued, responded to the needs of the American people. Standard surveys, however, were not clear on the needs of the American people. In February 1993, a *Time* poll showed that only 4 per cent of those surveyed said 'crime' was a primary concern. By January 1994, the numbers jumped to 19 per cent as public opinion was dramatically orchestrated by the bourgeois intelligentsia (especially the media). Despite the fact that numbers of criminal acts had not increased in any dramatic way, a moral panic was engineered with the 'criminal' as the new enemy of the American 'individual' (who had just 'won' its cold war against the 'communist'). The Crime Bill allowed the American public to believe that 'crime' is a major problem and that they must support the extension of the bourgeois police and the further militarisation of everyday life.

Elections are a notable time for the crystallisation of 'issues'. Presidential candidates draw upon their pollsters for the significant 'issues' which are bothering the American people. Between 1948 and 1988, American presidents ran for election on the strength of their commitment to combat communism; from 1988 onwards, the enemy has become the 'criminal', who more often than not is the American Black. In 1988, the Republican incumbent George Bush introduced the figure of Willy Horton, a Black man who was released from a Massachusetts jail for a furlough under a humanitarian programme started by Bush's Democratic opponent Mike Dukakis. Horton, as it turned out, committed murder during his trip from jail. Using a picture of Willy Horton, Bush promised that he would not allow criminals to roam the streets; the spectre of the Black man was to haunt the campaign which Bush eventually won.

The Crime Bill of 1993 came on the heels of the Los Angeles rebellion of 1992 and owes much to the then president Bush's criminalisation of what should at the very least have been acknowledged as a political rebellion (as it was by Mike Davis, 'Realities of the Rebellion', *Against the Current*, July-August 1992). On national television on May 1, 1992, Bush had this to say. "What we saw last night and the night before in Los Angeles is not about civil rights. It's not about the great cause of equality that all Americans must uphold. It's not a message of protest. It's been the brutality of mob, pure and simple. And let me assure you, I will use whatever force is necessary to restore order."

The criminal riff-raff have to be put in their place. The Bush verdict repeated the finding of the Kerner Commission on the Watts riot in Los Angeles in 1965. In 1992, the Black community was not as organised as it was in 1965 to defend itself from state racism. This time, in the midst of a recession and an attempt at stabilisation of capital, Black America was to be the target of political rivalry: who could be more tough on (Black) criminals, the Republicans or the Democrats?

When the Republican Party released its 'Contract With America' in mid-1994, it did so in order to determine the legislative agenda. One of the items in the 'contract' was a direct response to the Crime Bill and it was aptly named: 'Taking Back Our Streets Act'. The proposal is aimed to assert the ruling cliques full ownership and control of more than the streets through a further extension of the bourgeois police and the system of incarceration. In order to keep "dangerous criminals off the streets", the proposed act asks that parole be denied, that the death penalty be made more 'effective' and that the police be securely funded. There is no effective legislative opposition to the targeting of 'criminals' and 'immigrants' as the reasons for the enduring recession and restructuring of capital. As the agents of capitalism attempt to stabilise a floundering economy by 'down-sizing', the population recklessly seeks any promises of action which may offer a hope of immediate relief (government tax-relief, aid for business, etc) or the prospect of jobs (on the police force, replacement of immigrant workers).

The Young Communist League activist and editor of *Race File*, Libero Della Piana, ends a very sharp editorial on the Crime Bill with the following statement: "Our society is reaching the point where there are only two classes of citizens: those in prison, and the police" ('From the Cold War to the War on Crime', *Third Force*, November/December 1994). Instead of a peace dividend after the end of the cold war, Della Piana argues, the 'merchants of death' produced a "new war budget – this time for police and prisons". The US which already spends $ 80 billion on law enforcement and incarceration, will now additionally spend at least $ 30.2 billion. If Della Piana is concerned about the increase in inmates and in the police force, Morris Thigpen, the director of the National Institute of Corrections, is more sanguine. "People joke [that] we seem to be heading toward the day when you're either going to be in prison or working in some sort of way with corrections" (Sam Vincent Meddis and Deborah Sharp, 'Prison Business Is a Blockbuster', *USA Today*, December 13, 1994). As fewer Americans find permanent, well-paying jobs with benefits, the working-class will be pleased to find work of any kind: building prisons is not a bad idea and working in prisons seems better than starving. But, as the adage goes, people do not live by bread alone. People live on freedom, on love, on solidarity, on bread too. those 'basic needs', however, seem to have lost their sanctity as America moves further towards an illiberalism whose only outcome is a polarisation of the population and either fascism or, the Left gets its act together, the institution of people's democracy.

Contract Labour

Since 1989, the median annual income for a working family in the US has dropped by $2,344, according to the 1990 Census report, an additional million families fell below the poverty line.[1] This is the underbelly of the

current recession during this phase in the general crisis of capitalism. Business, in an attempt to effect a momentary stabilisation, are reducing their workforce, demanding longer hours for less pay and cutting back all the gains of the labour movement (such as health care, unemployment benefits, etc). In 1991, the unemployment rate in the US jumped 15 per cent as companies 'down-sized'; the unemployment rate for managers rose by 55 per cent. What is most significant about these numbers is that between 1982 and 1988 (the 'magical' Reagan years), 15 million new jobs were created and most of these jobs were in the service sector (which has borne many of the recent cuts alongside manufacturing). "The mushrooming service sector", Richard Barnet argues, "turned out to be vulnerable to the same fierce competition that has shrivelled factory payrolls in the US and caused real wages in manufacturing to drop 9 per cent since 1975. Indeed, there are by and large more low-wage jobs today in the service sector than in manufacturing" (Richard Barnet, 'The End of Jobs', *Harper's Magazine*, September 1993).

Contract labour, piece-work (including homework, childcare as well as manufacturing outwork) and temporary labour are not new forms of labour, but they are increasingly becoming the paradigm for the American workforce. F W Taylor and Henry Ford would not recognise today's economy which relies less on factory discipline than on the discipline of starvation. Contractors or jobbers offer a hard-pressed population work under unenviable conditions and the employers rely upon the desperation of their 'outworkers' to produce the quotas. Quality, healthcare, vacation time, etc, are the responsibility of the worker: the employer takes the best products, rejects the bad ones, and does not hire the worker during lean times or if the worker is ill.

The US government's Bureau of Labour Statistics reported in 1994 that temporary agencies accounted for 15 per cent of the new jobs created in 1993 and 26 per cent of the new jobs created in 1992, in 1989 temporary agencies accounted for less than 3 per cent of the new jobs. Reporting these figures, *The New York Times* explained that "in the recession, many employers, here and elsewhere, tried to keep their costs low by increasing their use of part-timers and temporaries, who work only during busy periods and usually get no benefits" (March 10, 1994). College graduates are now confronted with a job market in which they are forced to work for short-periods doing data entry, conducting market surveys, going door-to-door selling products or driving trucks (the number of truck drivers with college degrees has increased from 99,000 in 1983 to 1,66,000 in 1990). A generation of temporary workers is now moving into the workforce. Some 30 million Americans, or 25 per cent of the workforce, are employed in such conditions and they cost 40 per cent less than full-time permanent employees.

Stabilisation as a result of capital's general crisis takes many forms: militarism is one way out, colonial expansion is another and a fundamental revision of the 'contract' between capital and labour is yet another form. In the current process of stabilisation, there are predominantly three components: structural adjustment programmes in the third world and in eastern Europe, technological developments of 'smart weapons' and 'down-sizings' in business in the overdeveloped world. For the purposes of this essay, I am setting aside the first two components. The overdeveloped world is able to lean on mechanisation and the increased potential productivity of labour to release its 'surplus' workforce (and add to the reserve army of labour). Who is to pay for the upkeep of this reserve army, this unemployed and shiftless population? Families can no longer absorb the costs. Rents are too high and landlords are very strict about the number of people who can 'camp-out' in an apartment. Hence, homelessness. In a unusually reflective article, *Time* magazine reported on "the dearth of working class jobs that pay enough to support a life with even the basic necessities". Stagnating wages and escalating real estate prices have raised the problem to "crisis proportions". A local journalist in Telluride, Colorado pointed out that homelessness "brings instability and a surly workforce. We can't expect nice worker attitudes when people come to work begging a shower." In the same town, a worker in a shop who sleeps in a sleeping bag during 40°F nights had a very different perspective. "The town doesn't realise that the people who do their dishes and clean up after them have to live someplace too" (G Jaynes, 'Down and Out in Telluride', *Time*, September 5, 1994). Welfare, or state financial support, is becoming increasingly unavailable. Obsessed with overturning Reagan's deficit spending of the 1980s, the current managers of the American economy are bent on cutting government spending. Rather than touch the military (one component of stabilisation), subsidies to farmers or subsidies in the form of tax breaks to corporations, the regime aims to end the social safety net for the working poor and the disabled. Who, then, is to feed, clothe and shelter the reserve army of labour?

As more and more people go to prison each year in the US, the jail becomes the storehouse of the redundant working population as well as its soup kitchen. The state would prefer to provide social services to the unemployed if they submit themselves to total surveillance; the jail is the ultimate place for such debasement. But the prisoners are not reduced to monitored consumers; on the contrary, they work in what are called correctional industries. If contract labour is the form capital chooses to hire workers and defraud them of state-mandated benefits, correctional industries are the way capital preys on prison inmates to defraud that workforce of both benefits and minimum wage as well as to ensure that the taxpayer pays for the upkeep of the labour-force. The taxpayer subsidises this expanding labour-force which is unable to bargain for higher wages and for the most basic contractual arrangements. Prison inmates are a captive workforce who have no rights, only duties to capital. If anything, correctional industries are the highest stage of capitalist extraction within a formally democratic framework.

Penal Labour

There has never been any possibility that United States labourers could complete with prison labour and still receive a viable living wage, and now it appears that our workers are going to have a choice – compete with serf labour in the maquiladoras or compete with slave labour from the [Mexican] prisons. (Representative Henry Gonzalez of Texas, March 18, 1992).[3]

Representative Gonzalez warned American labour that it would not be able to compete with foreign unorganised workers in free-trade zones and in prisons. The sad irony of Gonzalez's warning is that it was misdirected: the use of prison labour has been growing in the US and it is beginning to function as the lever for capitalist accumulation. Prison labour might be opposed to non-prison workers from the standpoint of trade unionism, but it is certainly not contradictory to the dynamic of capitalism. It might even be its most efficient form. From 1972 to 1992, the number of prison inmates working in 'correctional industries' has increased by 300 per cent, from 1,69,000 to 5,23,000. The prison-industrial complex now hires more people than any Fortune 500 company with the exception of General Motors!

The jail business in the US amounts to $ 31 billion, an amount which has local governments bidding for federal and state jails. Since 1980, the number of prisoners

in the US has tripled and so, the jails are running at about 118 per cent of their capacity. The Crime Bill has authorised an additional $ 9 billion for the construction of jails. Construction companies, ancillary manufacturing (the making of sprinkler systems which ensure that inmates cannot hang from them) and medical firms (which provide medical care for inmates) are bidding for state prison contracts. The US Census Bureau recently noted that the hiring and training of correctional workers is the "fastest growing fuction...out of everything that govvernment does" (Meddis and Sharp, 'Prison Business' quotes Meredith De Hart of the Census Bureau). Since the late 1980s, the advertisements in *Corrections Today* (the magazine of the American Correctional Association) have increased by 300 per cent. Products as diverse as handcuffs, chewing tobacco and dandruff shampoo are advertised to attract prison administrators. With the increasing number of life-sentences in jails, some people are speculating that soon prisons will have to build geriatric wards which will need more government-funded medical personnel. Jobs, jobs and more jobs. Money, money and more money.

On June 18, an uprising at an Immigration and Naturalisation Services prison for illegal immigrants at Elizabeth, New Jersey raised numerous questions about the privatisation of jailing and the turn to jails rather than social welfare as the strategy of the democratic state. The corporation barons of Esmor Correctional Services Corporation once ran 'half-way houses' for the homeless in New York City, but in 1989 as New York cut-back on social welfare, Esmor "turned to the next emerging housing programme: prisons". (John Sullivan and Matthew Purdy, 'In Corrections Business, Shrewdness Pays: A Prison Empire', New York Times, July 23, 1995.) In 1993, Esmor won a $ 54 million contract to run the illegal immigrant jail in New Jersey; their bid was $ 20 million less than their closest competitor. The upshot of such a low bid was revealed in the aftermath of the prison uprising: a government report released on July 21 detailed "an atmosphere of penny pinching in the hail [as] poorly paid, ill-trained guards physically and verbally abused detainees, shackling them with leg irons, roughing them up and waking them without reason in the night". Quality, in the New World Order, is below the bottom-line. Opened on August 3 1994, the jail did not even last a year before it experienced the wrath of its victimised residents.

The prison industrial complex makes a variety of goods: licence plates, infirmary beds, razor wire, flags, furniture, drapes, janitorial chemicals, garments and signs/decals. They also perform the following services: auto maintenance and body work, refinishing furniture, laundry, printing and general labour (in workcrews) And this list is only from Rhode Island, the smallest state in the US About 20 years ago, Rhode Island Correctional Industries (RICI) was set up to produce various services for the state and for municipalities. If the 1950s penal philosophy said that bibliotherapy would heal prisoners, the 1970s inaugurated a belief that work was the salve needed to straighten out and reform criminals. Criminology provided a scientific basis for the emerging system of penal slavery: work, not for remuneration, but for therapy. For this reason, RICI advertises its task as rehabilitation: "We provide an opportunity for inmates to practise and improve existing skills and work habits that are valuable in securing and retaining employment upon release". Instead of putting money into training schemes for laid-off workers (due to extensive corporate 'down-sizing'), the government is training prisoners, who (if released) have a difficult time finding employment for their skills (as they now have a criminal record). In jail, however, they offer 'quality workmanship' on furniture and 'professional service' on construction and as 'highly skilled technicians' they fix automobiles. 'The quality standards' for the production of garments, the Correctional Industry argued,"can match any privately operating sewing shop on the outside." Because of the low-costs and the high standards, the industry urges state agencies, municipalities and non-profit agencies to 'Make Correctional Industries Your FIRST CHOICE'

Working in prisons is nothing new. In most states, prison inmates are required to work 40 hours a week on yard maintenance or other such prison-related tasks. They earn 'pocket money' of about 15 to 25 cents per hour. Prison industries, on the other hand, are something different. Here the prison produces commodities or services which are sold in competition with the private sector. Further American correctional industries are a necessary component to stabilise the current crisis of capitalism (as well as to offset government costs). Chinese prison camps are for an entirely different structural purpose. The Chinese camps are intended to produce goods to make the camps self-sufficient (they raise livestock and crops for the market and for consumption) as well as to produce commodities for export. The Chinese camps are intended as a means for originary accumulation, particularly of hard currency.[3] The American criticism of China in early 1994 on the issue of prison labour was notable for its hypocrisy.

What is wrong with prison labour is not that prisoners work. The problem is that they do not get appropriate wages, that they are not allowed to organise, that they get only the harsh benefits of prison life and that they cannot change or choose their jobs. In other words, the problem is that the struggle between capital and labour is resolved in the prisons on the side of capital by coercion. Consent is not a relevant category here.

A few months ago, I ran into a pamphlet from the Rhode Island Correctional Industries which advertised "15 secrets of saving" for NGOs. One of the services offered was a work crew of minimum security inmates for painting, litter cleanup, grounds maintenance, interior building cleaning (including rug shampooing and floor stripping). "We are constantly called upon to handle unusual, labour-intensive projects such as cleaning beaches or removing snow," the pamphlet explained. I called the office and inquired about the service (Larry Walsh of the RICI, December 16, 1994). I need a crew of 10, I said, for a day. The day runs for six hours, I was told, and it would cost me $ 350. I asked how much the inmates earned, but I could not get the cent figure. The inmates certainly do not get minimum wage ($ 4.25). For 60 man-hours of work, the employer would have to pay $ 255 at minimum wage (without benefits). That would leave $ 95 for the supervising correctional officer, the transport of the inmates and for their lunch. If we leave out the lunch and transport, then the officer makes under $ 16/hour (95/6). That is well below the officer's wage structure, which leads us to assume that the inmates make sub-minimum wages.

There is actually no need to speculate. On November 1, 1993, the Supreme Court ruled that inmates did not have the right to minimum wage as prisoners.[4] 300 inmates who worked for the prison industries programme sued the state of Arizona for work done between 1986 and 1988 under the Federal Fair Labour Standards Act (FLSA). They were paid between 40 to 80 cents per hour for their work with Arizona Correctional Industries. Further, Arizona law requires all wages earned by inmates above 50 cents an hour to be used for victim restitution, repayment to the state for room and board and support payments to children or other dependents. Therefore, the prisoners effectively earn 50 cents per hour. This is so across the US.

After an earlier dismissal of the inmates case, the 9th US Circuit Court of Appeals reinstated the lawsuits after they found an 'employer relationship' between the inmates and the state prison. The inmates' attorney argued that the sub-minimum wage structure produced unfair competition "that is harmful to private sector businesses" The state's

attorney argued that the inmates who work for private business (such as those who make reservations for Best Western hotels) are paid at least the minimum wage (which they do not receive, since they can only effectively earn 50 cents/hour); those who work for other prison industries are not entitled to minimum wage. Of course, the state's attorney did not answer the charge of unfair business, since the correctional industries provided goods and services at a lower cost than the private sector, who are obliged to pay minimum wage. The court agreed with the state that "prisoners working on a programme structured by the prison" are not entitled to minimum wage. (The case, decided on November 1, 1993, is *Hale vs Arizona*, 93-353.) The inmates, in the words of the Arizona Correctional Industries, work not for economic reasons, but to be better prepared to re-enter society once they leave prison. With the rates of incarceration on the rise, however, it seems as if there are to be more and more forced labour camps which will attempt to produce cheap goods and services for state and non-profit agencies. Besides given the reticence of society to 'take-back' released prisoners, the rates of reincarceration force us to see the prison population is relatively permanent.

Contradictions of American Liberalism

The relationship between money and politics is so organic that seeking reform is tantamount to asking a doctor to perform open-heart surgery on himself (*Newsweek*, December 13, 1971).

The horizon of the possible – and the necessary – is not the quixotic project of becoming a 'loyal' fringe of one or another of the capitalist parties, but the fight to build an independent left politics that has real and effective social anchorage... if there is to be any popular left in the 1990s, it will develop in the first instance through the mobilisation of the radical propensities in the Black – and perhaps, Hispanic – working classes" Mike Davis, 'Inventing the American Left' in *Prisoners of the American Dream*, London, 1986.

In response to the cuts in social services and the formation of this new "jail-industrial complex," Jesse Jackson has recently said that America has taken "a substantial step toward fascism." Fascism is not a word that should be thrown around loosely, but Jesse Jackson is correct to employ it at this time. The sapce for political manoeuvre at the national level is very narrow. At the same time as the ruling clique is on the rampage against social welfare for the working poor, they openly encourage tax-breaks and other subsidies for corporations. The political process in America today needs to be lubricated with millions of dollars in order for campaigns to be conducted (purchase of time on television for political advertisements, etc); in order to get access to vast sums of money, politicians court corporations through Political Action Committee (a legal coffer for corporate donations to politicians). If the Republicans have a philosophy for their open partisanship towards big business ('supply-side economics'), the Democrats have their own archaic way of justifying this relationship to their trade union and progressive supporters (as the natural means to win elections and as the only way to create a climate for business). Within such a narrow political arena, the social control of people of colour (notably Blacks and Latinos) and the increased exploitation of labour is seen as 'realistic.' Not only realistic, but it is also defended as culturally necessary for the survival of America (here we can locate the attack on making the curriculum of schools diverse, the so-called attack on 'political correctness').

American liberalism is torn by a contradiction which it cannot overcome: it pledges to promote equality, but it is also

NATIONAL COUNCIL OF APPLIED ECONOMIC RESEARCH

PARISILA BHAWAN, 11 INDRAPRASTHA ESTATE

NEW DELHI 110 002

TEL: (011) 3317860 to 68, FAX: (011) 3327164

NCAER has a vacancy for a position at the level of Economist for an industrial economist. The selected person would be working on projects related to Indian industry. The work would typically include data analysis and field work with a view to draw policy recommendations.

ESSENTIAL QUALIFICATIONS:

M.Phil or Ph.D. in economics from a reputed university or research institute; ability for independent research and developed writing skills; experience of research on Indian industry; knowledge of statistics and econometrics; interest and preferably experience in doing field work.

SALARY AND TERMS:

Employment terms are flexible and salary is negotiable.

Candidates will have to appear for interview at New Delhi and will be reimbursed first-class train fare by the shortest route to and from the place where they are presently working.

The candidate should apply with full particulars of and copies of at most two of their publications. Other things being equal, candidates from SC/ST and other backward and minority communities will be given a preference. Applications should reach the Registrar and Secretary of NCAER at the above address by *September 25, 1995.*

pledged to a system founded on mechanisms of social control which are authoritarian. American conservatism attempts to resolve this contradiction by announcing that the goal of equity is precisely what creates inequality and forces a benevolent American state to act illiberally (the furore around Charles Murray and Herrenstein's spurious book *The Bell Curve* illustrates the reactionary urge to justify inequality by an argument for natural differences). Get rid of the equity programmes, the Right argues, and let 'individuals' fight it out. Corporations, however, are treated as an 'individual,' one with a lot of accumulated power and capital. Real, living people are matched against this foe, but since they are increasingly outside unions and other organisations, they must struggle without power and without capital (only 16 per cent of the American workforce is unionised). The deck is stacked overwhelmingly on the side of global corporations.

Despite their obvious corporate partisanship, American conservatives pose as the true champions of equality and freedom. The process of equality, in the conservative argument, is now 'privatised' or made the responsibility of each citizen. The government, in this scenario, must withdraw from the goal of producing equity and must actively pursue the role of executioner and jailer. The contradictions of American liberalism are now simplified: there is inequality because people don't try hard enough (therefore House Speaker Newt Gingrich's statements about closing down the 'department of happiness'). The inflection of American conservatism is deeply racist. The 'people' who do not try hard enough for conservatives are urban blacks: the stereotypes of the welfare queen and the drug pusher are emblematic. Here American liberalism's practices are articulated openly as legitimate practices by American conservatism: the convergence between Republicans and Democrats on this issue is remarkable.

Capitalism was founded on plantation slavery. We have now come full-circle to a form of slavery which goes on at the fringes of American public life: penal slavery. The figures for incarcerated black males are remarkable: 23 per cent of all black males between the ages of 20 and 29 are in jail and there are more black men in jail than in college (Marc Mauer, *Young Black Men and the Criminal Justice System: A Growing National Problem*, Washington, DC, 1990). As Manning Marable argues, "prisons have become the method for keeping hundreds of thousands of potentially rebellious, dissatisfied and alienated black youth off the streets" (Manning Marable, *The Crisis of Color and Democracy*, Monroe, 1992). The American state will continue the process of controlling disgruntled and politically angry populations by the threat of prison and by the politics of 'realism' which moves dissatisfied Americans to discourage an analysis of their situation and to immediately lay the blame for their ills on immigrants, on the poor and on blacks. It will be these people of colour who will man the correctional industries and produce the few products which will bear the bitter-sweet label, 'Made in America.' 'Made in Prison,' would be more appropriate.

The task for the years to come will be to rearticulate the anger of Americans towards the nexus between the government and global corporations. In November 1994, the Republican Party swept the polls on an anti-establishment and anti-government platform (although the Republicans are wedded to protecting their own enclaves and to expand the most establish agent in the American system, the military). The voting patterns depict a misplaced anxiety among the population which directed its anger against the government and absolved its partner in the crisis, global corporations (Richard J Barnet, 'Lords of the Global Economy', *The Nation*, December 19, 1994. This anti-government feeling motivated the growth of para-military fascist organisations which were instrumental in the bombing of the Federal Building in Oklahoma City in early 1995 (these 'militia' groups sup at the table of ultra-racism, as they want to build a nation of Aryans in the service of Jesus Christ: one influential group is called the White Aryan Nation of the Church of Jesus Christ). What is good for General Motors is no longer what is good for America, let alone for the world. There is a political need to reposition the concern over an expanding government with the anti-social dynamic of transnational corporations (which translates through the commercial markets into the dynamic of small business).

At the 1992 United Electrical Workers' Convention, Robert Wages (president of the Oil, Chemical and Atomic Workers Union) urged progressive trade unionists to re-energise the political arena. "The bosses have two parties," he said, "we just want one... We want you to join with us, as we join with you, to create that new political discussion" (United Electrical 57th International Convention, *Officers' Report*, August 31-September 4, 1992). Wages' union pioneered the Labour Party Advocates, which, in its very name, demonstrates the hesitancy to put itself forward as a legitimate opposition in the light of the convergence of the Republicans and the Democrats. Part of this hesitancy comes from the desire to work from within the Democratic Party and part of it comes from the political theory of the 'unorganised' Left which condemns itself to failure. Resolutely mired in the belief that 'hierarchy' and 'Party' are themselves totalitarian, the 'third force' in the US is unable to forge a bloc worthy of taking on the two-party monopoly. The creation of coalitions (even on the basis of short-term issues) within 'new social movements' are always preceded by strenuous deliberations on rules of procedure without a commitment to setting-up or joining long-term political parties. The stray attempts cannot get off the ground because of the inability to break through the two-party monopoly over public consciousness and media as well as because of the lack of political will of the participants within the evolving 'third force'. America needs a bold and organised political force which will not bend before the might of internal militarism, wavering Social Democracy, defeatism, jingoism and the financial muscle of global corporations.

On August 11, 1928, president Hoover made the following optimistic speech: "Unemployment in the sense of distress is widely disappearing. We in America today are nearer to the final triumph over poverty than ever before in the history of any land. The poorhouse is vanishing from among us. We have not yet reached the goal, but given a chance to go forward with the policies of the last eight years, and we shall soon with the help of God be within sight of the day when poverty will be banished from this nation" (*The Nation*, June 15, 1932).

America has indeed succeeded in this mission insofar as its poor have 'disappeared' into jails; its unemployed and its reserve army of labour are being held in place behind prison walls, working in correctional industries or being kept alive in case of a shortage of labour.

Structuralism Fights Back

Errol D'Souza

Poverty and Power: The Role of Institutions and the Market in Development edited by John Cameron with Hans Ramharak and Ken Cole; Oxford University Press, Delhi, 1995; Rs 395.

THE 1980s witnessed the demise of the Structuralist position in development studies and the ascent of the neo-liberal position which relentlessly criticised two characteristics of the Structuralist tradition. Firstly, they charged the Structuralists for de-emphasising the importance of relative prices as a means of affecting distributive and productive outcomes. The Structuralists emphasised non-price variables such as big investment pushes (Rosenstein-Rodan) and the cumulative causation of inequality (Myrdal) as important in affecting economic responses. Secondly, the style and extent of state intervention favoured by Structuralists was also criticised by the neo-liberals. The Structuralists assumed that reformist states exist. This assumption was also criticised by the Marxists who pointed out that redistribution of incomes would be against the interests of the owners of capital as well as by the non-Marxists who argued that governments have to reward interest groups that keep them in power and so would not jeopardise the status quo.

From the critique of Structuralism emerged the central thesis of the neo-liberals that long-run growth and development will proceed provided everything possible is done to achieve short-run allocative efficiency. They accordingly reasserted the primacy of economic growth amongst policy objectives, believing poverty will thereby be most effectively reduced. The belief they promoted accordingly was that imperfect markets are better than imperfect states. A recurring neo-liberal theme accordingly is the desirability of achieving a reduction in state spending in developing countries. In the social sectors they are advocates of the introduction of user charges for education and health services and the encouragement of their private provision. The Structuralists identify the state as the agent of change whereas the neo-liberals promote the market as an instrument of change.

The various contributors to the volume under review share a common background of being Senior ILO consultants and are Structuralists attempting to reassert a case for state intervention. Their common position is that economic behaviour is strongly conditioned by the institutional environment and that conflict (conditioned by modern technology or the pecuniary institutions of capitalism) is the business of economics rather than harmonious equilibrium and this requires the social control of economic activity. In the process they 'over-politicise' the state in contrast to the neo-liberals who 'under-politicise' the market.

The contributors would like to use the power of the state to eliminate some of the human costs of capitalist development whilst retaining its productive advantages. Though not spelt out, the elements of their proposed policy regime of active state intervention include: (i) Economic management techniques are to be used to smooth out business cycles which will increase the bargaining power of workers *vis-a-vis* their employers. (ii) The tax system should be used to correct the excessive inequalities of income and wealth resulting from capitalist development. (iii) The state is to promote the welfare objectives of eliminating poverty, providing for those with special needs, and contributing further to the reduction of inequality.

The practical success of such a programme is doubtful. Keynesian methods no longer have the desired effects in developing countries with a large informal sector (the sector 'discovered' by the ILO). Their effects are inflationary and result in redistribution not only between employers and workers but also between those in the informal sector and those in the formal sector. Second, the impact of the fiscal system on the overall distribution of income and wealth has had limited effects. Such measures have been circumvented on a large scale leading to a growing black economy, under-investment, capital flight, etc. Also, the welfare state has been unsuccessful as a means of tackling absolute poverty and diverting resources to those with special needs and it has been even less successful in mitigation inequality. Such a programme accordingly leads to an expanded state sector, an increase in the tax burden carried by nearly all social groups and no appreciable increase in social equality. It is in large part the perception of this scenario that has caused the defection of organised sector workers from socialist welfare perspectives towards neo-liberal views.

The strategy adopted by the writers in this book is empiricist and the major objective is to take on the neo-liberals by seeking to provide evidence that non-market institutions such as the state were responsible for beneficial developments whenever these occurred. Such a strategy is diminutive as it cannot undermine the more important normative arguments surrounding the broad claims of whether a good society can be built entirely around private property and market mechanisms. The reduced objective does not allow such a strategy to cope with its own limitations. The limits of state intervention as pointed out above pose problems for the strategy's favoured instrument of change – the state. When confronted with this the authors shrug and leave it at that. Ashok Rudra in a chapter that brilliantly surveys the two failures of Indian planning – neither growth nor social justice to any adequate degree – accounts for it in terms of the state being incapable of doing anything that adversely affects the interests of certain classes (big capitalist houses and the rural rich) and the dominant section of the bureaucracy being elitist. Keith Griffin, R Islam and Eddy Lee, and Swapna Mukhopadhyay who examine rural poverty in Asia add that given the nature of the state, domestic policies needed to reduce poverty are unlikely to be introduced. This presents a Radical Dilemma of agency – how does change occur, and in what sort of institutions and individuals does it gain momentum from?

A favoured institution the authors advocate is some form of co-operative system. The individuals that can usher in the required change are the rural poor who need to organise themselves politically. Co-operative systems are preferred as they promote employment, income equality, the provision of public services such as health and education, and provide an institution for local participation. Whether co-operatives promote employment is debatable. Capitalists hire workers whenever the marginal returns exceeds the marginal cost. If the employee can be hired for Rs 25 and makes Rs 26 profit for the enterprise, he will be taken on. In a co-operative, if income is equally distributed and if the going rate is Rs 30 per head, an extra worker will not be hired at Rs 25 as it would reduce incomes all round. Co-operatives accordingly tend to be smaller than capitalist firms.

Even income equality is a doubtful outcome. Co-operatives inevitably generate income inequalities of two kinds – inequalities within co-operatives stemming from differences of skill and responsibility among members, and inequalities between co-operatives stemming from variations in economic performance. Finally, if co-operatives do not produce all that is required

by their members, how is exchange between co-operatives to be mediated – through markets or state planning? Or is it that the market will provide most goods and services whilst the ownership of capital will be socialised? The book is silent on such issues on which the edifice of its policy proposals rest.

An important section of the book deals with the importance of institutions in market-led industrialisation. Here, Singapore's rapid industrialisation is attributed to domestic government policies (liberal investment policy and fiscal incentives) that took advantage of favourable external circumstances. Singapore is thus another example along with Japan, Taiwan and the Republic of Korea whose success is not the outcome of the operation of unrestricted market forces. Two phenomena that are emerging as important in the developing world are export processing zones (EPZs) and migration. Gus Edgren appraises labour conditions in EPZs and Rashid Amjad analyses the impact of migration.

EPZs are instruments which enable developing countries to undertake partial and limited liberalisation by creating an enclave where the free import and export of factors and products is allowed and the enclave made a part of the world market. Garment manufacturers and electronic component firms account for predominant employment in zones in Asia. Edgren points out that EPZs have almost exclusively concentrated their recruitment on young, unmarried females. Promotion prospects are minimal, very few jobs require supervisory or technical skills, overtime is a regular feature, strikes are often illegal, and a labour conciliation process and minimum wage laws are non-existent. Given that skills derived from training and education are not a prerequisite for employment in EPZs (except in software firms), it is not surprising that wage rates and working conditions approximate those in the informal sector of developing economies. EPZs may accordingly do well on the criteria of expanding the net foreign exchange earnings of an economy or attracting foreign private investment but the employment that is generated has the characteristics of informal sector employment. How do we then evaluate EPZs? Do they promote welfare? An empiricist approach such as that adopted by the contributors to the book does not unfold criteria for judgment. It allows us to understand the world as it is, but does not provide the leverage to change it. Paradoxically, however, the contributors want to change the dominating neo-liberal outlook on the economic world

The chapter on migration documents how the gross outflow of migrants as a percentage of the incremental labour force in 1982 was 45 per cent for the Philippines, 40 per cent for Korea, 33 per cent for Sri Lanka, and 50 per cent for the Indian state of Kerala. The subsequent decrease in outmigration that India and Pakistan experienced was avoided by the Philippines due to its high rates of school enrolment and the flexibility of its educational system. The migration of trained people whose education was subsidised by the state results in a social loss as the country does not get the benefit from its investment in the person.

Should the state then require migrants to pay the cost of their training or should it prohibit migration? This policy dimension is ignored, again because of the contributors to the volume shying away from the normative tradeoffs that are essential to public policy debates. Except in some industries such as construction, no skill shortages were experienced as a result of the migration. However, the quality of output suffered as more experienced workers left first. Also, remittances from migration offered much relief for countries facing balance of payments difficulties. Again, however, remittances which are potential sources of savings and investment capital formation have not had the requisite growth impacts as they have by and large gone into increased consumption expenditure (often durables) and unproductive investments such as land and housing that have fuelled inflation. The social costs and benefits of migration often outweigh the private costs and benefits and so corrective measures are essential.

The other chapters in the book deal with public sector growth in Malaysia (Supian Haji Ali), employment generation through private entrepreneurship in Vietnam (P Ronnas), a framework for enabling productive employment in Pakistan (James Cameron), and on an integrated framework for human development planning from the supply side (Christopher Colclough). When there is a dominant paradigm it is difficult to detract from its hegemony. Yet the authors have managed to question and expose its weaknesses. Though their position currently in the development debates is off-centre, they offer the ingredients that will be sought to replenish the thinking in the discipline when it is realised that markets also are like states in that they are not neutral as regards distributional outcomes and as to the significance they give to various individuals in the social scheme

State, Society and Religion

S K Chaube

India's Agony over Religion by Gerald James Larson; State University of New York Press, Albany, 1995; pp xiv + 393.

A BOOK that announces in its preface that many of the discussions in half the text is "rather dense and difficult" and at the same time claims to be "primarily designed for the non-specialist general reader" (p xi) is difficult to review; for the reviewer does not know which yardstick he should use. He would rather suspect that the author of the book has covered unfamiliar as well as familiar ground.

Which appears to be the case here. There is no doubt about the vast scholarship that has gone into the writing of the book. Yet one has the feeling that the real domain of the author is Indology in the classical sense of the term. Though the references to Sanskrit sources are secondary the author is obviously aware of their meanings and contexts. This can probably be not said about the Islamic texts. The treatment of Islam is historical and synoptic as is the treatment of Christianity. The work, therefore, cannot strictly be classified as 'comparative religion', which is the author's basic discipline. It would be more apt to describe it as 'sociology of religion' in the Weberian sense – a description justified by the author's interplay of the phrases 'religionisation of politics' and 'politicisation of religion' and the use of the concept of 'civic religion'.

The author's 'broadly anthropological notion' of religion (p 166) entails three basic relations, namely, (1) the relation between the human organism and culture (enculturation), (2) the relation between human organism and society (socialisation), and (3) the relation between culture and society on the one hand, and the internalisation or reflexive awareness of the human organism, on the other (individuation). Furthermore, religion has to do with the development of comprehensive interpretative frameworks regarding the meaning and significance of human existence-as-such (together, of course, with an accompanying behavioural lifestyle in terms of rituals, normative patterns of behaviour, and so forth) (p 165) Religionisation is defined as "that process whereby the human organism becomes a mature, normal person through the assimilation and co-ordination of enculturation and individuation into a comprehensive interpretative framework (together with an accompanying behavioural lifestyle) that renders human existence meaningful and significant" (p 170).

The author shows appreciation of the complexity of the Indian society. He stresses that there is nothing like an abstract 'essence' of Indian civilisation. Of course there are distinctive cultural presuppositions operating in each of the historical periods. But there are no common features or presuppositions that hold overall. Instead, every historical phase is marked by "a certain distinctive kind of ongoing conversation or cluster of conversations" among diverse, even contradictory, cultural values and their 'basic warrants or authorities'. Hence the profound formulation:

> The deep and substantive coherence in Indian history and civilisation is in the ongoing conversation itself that cuts across or spills over the boundaries of periods and groups (pp 142-43).

The author observes that in the cultural history of India there are six major layers marked by discontinuities: the Indus Valley (c 3000-1500 BCE), the Indo-Brahminical (c 1500-600 BCE), the Indo-Sramanical (c 600 BCE-300 CE), the Indic (Hindu-Buddhist-Jain) (c 300-1200), the Indo-Islamic (c 1200-1757), and the Indo-Anglian (c 1757-present). But he sees their discontinuity as continuity in the sense that "in phase after phase of the unfolding of the history of cultures in India, what is apparently extraneous, foreign and utterly different is absorbed or assimilated, not by being transmuted into something other than itself in order to conform with some pre-existing Indic identity, but rather, by being allowed to stand in its very extraneous and foreign otherness as one more component of an identity that is indeterminate and always yet to be, but with the attendant paradoxical claim that somehow all such components have always been present at least implicitly" (p 52)

The author's identification of the Indus Valley civilisation with the 'village' or 'folk' religion (p 57) is somewhat sweeping. The association of the bathing tank at Mohenjodaro with "some sort of ritual bathing practice" is problematic inasmuch as there is no evidence of a temple around it. The author actually says "a majority of Hindus in present-day India still follow a prehistoric spirituality that predates even the Indus Valley layer of civilisation" (p 56).

The Indic period, popularly known as the 'Hindu' period, is but a synthesis of the Hindu, the Buddhist and the Jain traditions. In this period the specifically 'Hindu' traditions came into focus: the principal gods and goddesses, the basic patterns of worship and ritual performances among Vaisnavas, Saivas and Saktas in home and public temples, the compilation of 'smriti', the great epics and Dharmasastras, the appearance of ritual-erotic texts and formulation of the basic notions of 'karma' and rebirth.

When Islamic conquest of India began to occur, it was not of the original Arab variety. It came mainly during the late Abbasid caliphate when Islamic culture and civilisation had become cosmopolitan on the one hand and politically fragmented on the other. These facts diluted the monolithic character of that civilisation. For India, on the other hand, the Islamic challenge was total and could not be just accommodated or absorbed in the way of the previous ones. The confrontation of the two civilisations was to be exceedingly fruitful, "albeit also deeply frustrating and painful" (p 104). The author finds the Sufi agencies more effective at the popular level of Islamisation than at the elite level. At the same time, while at the popular level, there was a synthesis of the Hindu and the Islamic faiths, at the elite level the differences persisted.

Encounter with colonialism gave birth to an Indo-Anglian tradition and an Anglo-Islamic one. The former resulted finally in the modern 'secular' (and pan-Indian) nation-state or, what Ravinder Kumar called, the civilisation-state of India and the latter in the modern (regional) nation-state of Pakistan and, subsequently, Bangladesh, both as Islamic republics. In a somewhat sweeping generalisation the author puts Ram Mohun Roy, Keshub Chander Sen, Dayananda Saraswati, Ramakrishna, Vivekananda, Ranade, Gokhale, Tilak, Savarkar, Tagore, Aurobindo, Gandhi and Nehru all in the first group and Sayyid Ahmad Khan, Ahmad Riza Khan (Barelwi), the founding of the Muslim League, the Khilafalists, Jamal al-ulama-i Hind, Abul Kalam Azad, M A Jinnah (whom he calls "the first prime minister of Pakistan"), Muhammad Ilyas (Tablighi Jamaat) and Sayyid Abul Ala Maududi (Jamaat-Islami) in the second group (pp 121-221).

To some extent the author observes, the older Hindu traditions remained "defensive and in-grown" implicitly suggesting that they were politically inconsequential (p 126). The common features of the neo-Hindu reformist and nationalist movements, according to the author, have been (1) a primary focus on developing among the people of India a self-confident national awareness that will provide a solid foundation for India as a modern nation-state; (2) the reform of outdated, parochial and superstitious Hindu practices; (3) the rejection or radical reform of the caste system; (4) female emancipation; (5) improvement of the social conditions of the poor; (6) economic progress for the entire nation; and (7) development of techniques of communication and propagation borrowed largely from Protestant Christian model (pp 133-34).

Thus Indian nationalism, according to the author, is essentially a Hindu enlightenment

view with no Islamic input. One wonders how the author missed the facts that Ram Mohun Roy, at a quite early period of his social activity, wrote in Persian advocating the unity of all religions, Ramakrishna became famous for his 'iata mat tata path' (different ways to one god) sermon, Tagore insisted that the Indian civilisation was made up of Hindu, Muslim, Christian, Sikh and other religious persuasions and different ethnic stocks and Nehru subscribed to the same view! According to the author, this at least was the Muslim perception of the Gandhian nationalist movement (p 135). The author notes three different strands of Muslim response: the Aligarh variety (separatist), the Deeband variety (accommodationist) and the Bareilly variety (anti-modernist and anti-nationalist).

The south Asian religions (Hindu, Buddhist and Jain) are marked by cognitive indeterminacy ('nirguna bhava'). But there are exceptions:

> The Hindu-RSS-VHP-BJP, for example, or the Arya Samaj, appear to have close affinities with such cognitively determinate, polity-oriented, 'nation-state' tradition as the Islamic Republic of Iran or the Islamic Republic of Pakistan (p 175).

Elsewhere he notes the high political motivation of the Arya Samaj and the Hindu RSS-BJP-VHP as well as the Gandhian-Nehruvian neo-Hindu nationalist movement which he calls "Indic civil religion (Gandhian-Nehruvian)". One theoretical risk with the 'comprehensive interpretative framework' is the loss of autonomy of religion. To a certain extent, the concept of 'civil religion' violates the Weberian trichotomy of the primitive, the traditional and the rational by branding the Gandhian-Nehruvian nationalism as a religion. What else does a phrase like "the secular as religion" mean? What he describes under this heading is the growth of communal (and casteist) politics in India within the modernist framework. Is it necessary to identify communalism with religiosity?

While addressing himself to Indian politics he slides to journalism. His neo-Hindu 'secular' state is defined in terms of caste alliance of brahmins, scheduled castes, scheduled tribes and minorities following an article of Khushwant Singh in *Sunday*. Khushwant Singh, in turn, cited the authority of one Brother Stanny of St Ann's Church of the Dhule in Maharashtra who had "compiled figures of different castes in government employment during British rule in 1935 and as they were 35 years after independence in 1985" (pp 210-11, 275, 332). It is not even clear from the citation whether Singh's authority is published or if the data is all-India or based on Maharashtra. Considering the fact that Maharashtra is an originator of anti-brahmin politics, the citation is doubly suspect.

The blatantly inadmissible evidence wipes out any distinction between 'the Gandhian-Nehruvian' secular "neo-Hindu orientation" and "the BJP neo-Hindu conservative orientation" of the "highest ruling elites" (p 275), though the author is slightly uncomfortable with the recent ascendancy of the latter (p 277). The author approvingly cites T N Madan's dismissal of secularisation, i e, privatisation of religion as "very much a late Christian idea" (pp 281-82). Consequently, he joins the bandwagon of T N Madan and Ashis Nandy who consider the secular state as an empty notion in a country where 83 per cent of the population is Hindu.

The sociologist of India suffers from a dilemma – an inability to distinguish between the state and the society. Consequently, an unsound dichotomy between communalism and secularism is assumed for getting the fact that the former is a socio-political category and the latter a legal-political one. In other words, the former is a faculty of society, the latter of the state. Absence of religious-communal tolerance necessitates the secularisation of the state for the sake of its own autonomy. It is wrong to assume religious-communal tolerance itself as secularism. By the same token, the liberal dose of personal freedom of worship and communal rights to culture does not in itself make a secular state. Nor does its proclamation in the preamble to the Constitution. A long time ago, V P Luthra held India to be a 'jurisdictional state'. Whether India should be a secular state or not is a political question. But whether secularism has succeeded in India or not is a wrong question.

The concept of 'American civic religion', which the author adopts from Robert N Bellah (pp 201-02) and advocates for India as "a middle ground between the extremes of a neo-Hindu 'secular state', on the one hand, and a supposed Hindu state, on the other" (p 292) has itself grown outside the domain of the state. The term 'civil religion', according to author, "derives from Rousseau" (p 201). For Rousseau, however, the government had no autonomy. It is a fact of history that the French revolution abolished state religion.

So, what begins as a significant sociological perception of continuous cultural dialogue becomes a political obsession (tinged by the author's professional predilection?) issuing in the following prescription of a multi-religious state:

> No one religious tradition would be favoured or established, but all would be recognised (including secularist and agnostic traditions) and 'enfranchised', as it were, in matters of public policy, especially in the areas of research education and communication. Just as there is an All India Institute of Medical Sciences or an Indian Council for Philosophical Research, so there could be an All India Institute for Research in Religion or an Indian Council for Research in Religion. Membership in such an institute or council would be determined by participating religious groups that take part, in consultation, of course, with appropriate government officials. Whether there would be a department of religious affairs or simply an institute or council for co-ordinating research, education and communication regarding issues related to religion would have to be determined as planning develops (pp 282-83).

But even the source of funding is laid down keeping in view the stipulation of Article 27 of the Indian Constitution. An amendment of Article 28 (1) is suggested in the same breath . Obviously, the author has no time to ponder who 'recognises' and 'enfranchises' religions and who 'co-ordinates' research, education and communication in it. A blueprint for a Deen-e-Elahi or the vision of a brave new world?.

NEW BOOK FROM

PUBLISHERS OF THE HUMANITIES NATURAL & SOCIAL SCIENCE

EMERGING FRONTIERS OF URBAN SETTLEMENT GEOGRAPHY

Edited By
S B Singh

1995, xiii, 180p, maps, ref, tables; 22x14 cm
ISBN 81-85880-83-2 Rs.240.00

The book focusses upon multifaceted themes, meaning and scope of urban settlement geography, classification, morphology, urban transportation development policy and urban environment problems.

Reliance accelerates liberalised

Making the most of Liberalisation

During the last four years, the liberalised economic policies of the Government have resulted in rapid revamping of the Indian economy. These measures have allowed us unprecedented freedom to set more ambitious goals and targets for our Company. Our Company has emerged stronger than at any time in the past, in this changed scenario.

	Post - Reform			Pre - Reform		
	Rs. in crores		CARG *	Rs. in crores		CARG *
	1994 - 95	1992 - 93	%	1991 - 92	1989 - 90	%
Sales	7019	4106	30.7	2953	1841	26.6

Cash profit	1343	802	49.4	356	252	18.7
Net profit	1065	322	81.9	163	91	34.3
EPS	23.4	13.1	33.5	7.2	5.9	10.0
CEPS	29.5	24.5	9.5	15.7	16.6	2.8

* Compounded Annual Rate Of Growth

Four - fold growth from 16 to 62 lakh Tonnes Per Annum

Financial Results 94-95

- Sales Rs. 7019 Crs. (US$ 2.2 billion) - up 31%
- Cash Profit Rs. 1343 Crs. (US$ 0.43 billion) - up 62%
- Net Profit Rs. 1065 Crores (US$ 0.34 billion) - up 85%
- Net Worth Rs. 7193 Crores (US$ 2.3 billion) - up 66%
- Total Assets Rs. 11529 Crores (US$ 3.6 billion) - up 42%

Oil & Gas production commenced

Our Company has commenced the production of oil & gas - the first Indian private sector Company to achieve this from Panna, Mukta and Tapti fields in association with Enron Oil & Gas and the ONGC. The recoverable oil and oil equivalent of gas reserves would be around 60 million Tonnes.

New Projects at Hazira

Our Company is building one of the **world's largest petrochemicals complex.** When completed, our investment would cross Rs. 10,000 crores (US$ 3.2 billion) at Hazira - by far the largest capital expenditure programme at one location.

Over 27,000 people are working round-the-clock to construct the second phase.

- 1.2 lakhs Tonnes Per Annum POY (Partially Oriented Yarn) plant with DuPont technology from USA
- 80,000 Tonnes Per Annum PET (Polyethylene Terephthalate) plant with Sinco technology from Italy
- 1.6 lakhs Tonnes Per Annum PSF (Polyester Staple Fibre) plant with DuPont technology from USA
- 3.5 lakhs Tonnes Per Annum PTA (Purified Terephthalic Acid) plant with ICI technology from UK.
- 1.2 lakhs Tonnes Per Annum MEG (Mono Ethylene Glycol) plant with Shell Process
- 22 lakhs Tonnes Per Annum Cracker Products with Stone & Webster from USA
- 3.5 lakhs Tonnes Per Annum PP (Polypropylene) plant with UNIPOL Process.
- 2 lakhs Tonnes Per Annum PE (Polyethylene) plant.

New Petrochemicals Complex at Jamnagar

- Petrochemicals complex at Jamnagar, larger than the Hazira Petrochemicals Complex
- In its first phase, it will build.
  - PTA complex with an annual capacity of 10 lakh Tonnes
  - Paraxylene plants with an annual capacity of 12 lakh Tonnes
  - Polypropylene with an annual capacity of 3.5 lakh Tonnes.

Paraxylene project will be the single largest in the world.

Emerging Global Ranks

- **World's largest multi-feed cracker** with a capacity of 22 lakh TPA of various petrochemicals products
- **2nd largest PTA (Purified Terephthalic Acid) producer in the world,** increasing production from 257,000 TPA to 16 lakh TPA.
- **4th largest Paraxylene producer in the world,** increasing its production from 150,000 TPA to 13.5 lakh TPA.
- **4th largest Polypropylene producer in the world** having a total capacity of 700,000 TPA.
- **8th largest Polyester producer in the world,** increasing its production from 200,000 TPA to 580,000 TPA
- **10th largest Polyethylene producer in the world,** increasing its production from 166,000 TPA to 400,000 TPA.
- **10th largest PVC (Polyvinyl Chloride) producer in the world,** increasing its production from 187,000 TPA to 600,000 TPA.

Excerpts from the statement of Shri Dhirubhai H. Ambani, Chairman, Reliance Industries Limited. These excerpts do not purport to be a record of the proceedings of the 21st Annual General

performance in a environment

Investor Family and Care

Reliance today, is the success of the twenty-six lakhs strong Reliance Shareowners family - perhaps the world's largest investor family growing from strength to strength. Our Company's investor policy, is, and will continue to be, to **increase the long term networth of the investors.**

Company to announce .

- Scheme for small individual shareholders
- Consolidation of Odd Lot shares into marketable lots
- Disposal of Odd Lot upto 20 shares in a Folio
- Buy back of Odd Lot holdings in H, J & K series upto 10 debentures
- A separate cell to reply over the telephone nationwide

Environment, Health and Safety

Responsible Care is a public commitment because the welfare of humanity concerns us all The Hazira Manufacturing Division has been awarded the Indian Merchants' Chamber "Diamond Jubilee" Award for outstanding contribution towards Control of Air and Water Pollution in Industry Reliance is the only Company to receive this all-India award

Nature is our heritage - it's our duty to preserve, improve and hand it down to our children as a treasure.

- According to British Safety Council, Reliance is one of the 30 safest companies in the world.
- Won seven national and international awards.
  - British Safety Council, UK
  - National Safety Council, USA
  - National Safety Award, Govt. of India

Creating world class assets for the country of nearly Rs. 14,000 crores (US$ 4.4 billion) in less than 20 years

Taxes & Duties

Our Company is one of the largest contributors of taxes and duties to the Government. This year, our **Company paid Rs. 2147 crores of taxes and duties** - an increase of 54 %.

Quality

Reliance is committed to integrating "Total Quality" in all its activities. The Patalganga facility is the first integrated Indian Petrochemicals and Fibres complex to be awarded an ISO 9002 certificate.

Our People

People are assets you can never show on a balance sheet.

Our Company has a human resource asset of around 12,500 people; **3000 of which constitute scientific and technical manpower.** Every year, we add over 450 young professionals who include engineers, chartered accountants, management graduates and professionals from various other disciplines. **The average age of our employees is just 38 years.**

Reliance - Consistent Performer

Our Company enjoys a unique distinction among the Indian Corporates as a very **consistent performer in terms of growth, asset creation and profitability** through efficient management of the resources.

Reliance
Industries Limited

Where growth is a way of life.

Meeting held on 03.08.1995.

Gender, Caste and Labour

Ideological and Material Structure of Widowhood

Uma Chakravarti

This paper examines widowhood within the larger structure of relations, material and ideological. Distinctive cultural codes form the basis for caste hierarchy and control of female sexuality with permanent enforced widowhood at the apex is the index of high rank. Conversely, widow re-marriage is not only an ideological rationale for low caste rank but provides a demographic basis for production relations. A single caste framework functioning both at the level of ideology and material arrangements requires distinctive patriarchal arrangements and cultural codes among the hierarchy of castes to reproduce the structure of production.

I
Introduction

IN this paper I shall attempt to explore the relationships among gender, caste and labour in the context of widowhood. I will look mainly at widowhood among the upper castes, an issue that has dominated our consciousness for over a century, but try to understand the larger structure of relations, material and ideological, in which patriarchal practices enforced permanent widowhood on women. I argue that patriarchal practices among the different castes, though dissimilar, are part of a larger structure of caste, production, and reproduction. Thus traditional patriarchal practices could be very distinctive for various castes to make for a hierarchy of cultures and a system of production in which the low castes labour and reproduce labour, whereas the high castes do not labour and reproduce only specialists - ritual specialists or a literati which performs specific types of non-manual work

Further, I suggest that the distinctive cultural codes form a basis for the hierarchy of castes in which not only are castes ranked in an elaborate hierarchy, but there is an ideological and material rationale for the hierarchy. The stringent control of female sexuality among other 'non-labouring' high castes with permanent enforced widowhood at the apex of the cultural codes becomes the index for establishing the highest rank in the caste system. Conversely, the range of marriage patterns practised in the case of widows among the lower castes, which the higher castes often impose upon them, nevertheless becomes the ideological rationale for ranking these castes as low. This serves a double purpose, since not only does it establish distinctions between castes and legitimises the hierarchy of caste, it also establishes a firm demographic basis for production relations. Thus a single caste framework functioning both at the level of ideology and material arrangements requires distinctive patriarchal arrangements and cultural codes among the hierarchy of castes to reproduce both the ideological and material arrangements of a certain structure of production.

I attempt to argue in this paper that the experience of widowhood must be firmly situated in a certain kind of production relations apart from its patriarchal context, as the discussion below will amplify.

Conceptualising Widowhood: Widowhood as Social Death

Widowhood in India among the upper castes is a state of social death [1] The widow's social death stems from her alienation from reproduction and sexuality, following the loss of her husband and her exclusion from the functioning social unit of the family. Once a woman ceases to be wife (especially a childless wife) she ceases to be a 'person' – she is neither daughter nor daughter-in-law The problem posed by brahmanical patriarchy therefore is: since the wife has no social existence outside of her husband, then as a widow who, or what, is she? The texts and the rituals attempt to work the problem out The problem itself was simply that although the widow is socially dead, she remains an element in society: the question then was how to incorporate her One way could have been to constitute a separate community of widows, a non-sexual community such as that of the female ascetics Another would be to retain her in society but place her on its margins and then institutionalise her marginality. This is what brahmanical patriarchy did with the widow. The widow's institutionalised marginality, a liminal state between being physically alive and being socially dead, was the ultimate cultural outcome of the deprivation of her sexuality as well as of her personhood.

The widow's marginal state meant that she was, in a manner of speaking, functionally incorporated into the household while being considered an outsider. Thus while she was functionally incorporated either into the natal or affinal family, the widow, especially in the affinal household, was the 'domestic enemy'. At the same time she was the 'insider' who had fallen, one who had ceased to belong and been expelled from normal participation in the community (for failing to prevent her husband's death). She was the object of divine and social disfavour. Widowhood was perceived as a disrupter of social order and a potential violation of the moral order. There are two modes of representing the social death of widows: one is intrusive, in which the widow was conceived of as someone who did not belong because she was an 'outsider' (as in the affinal home), and in the extrusive mode, the widow who had left her natal home following marriage became an outsider because she no longer belonged. The widow was both simultaneously – in the affinal and in the natal home she became the outsider who now no longer belonged, and in this sense she shared the sense of being an outcaste. It was not, however, the rules of purity and pollution but those of inauspiciousness that were the means of maintaining social distance in the case of the widow. The widow was socially differentiated by prescribed behaviour which she had at all costs to follow.

Symbolic ideas of a cultural system are usually given social expression in ritualised patterns. The death of the husband (without whom the widow ceased to be a social entity) among upper caste Hindus was ritually expressed through special ceremonies involving the marginalisation of the erstwhile wife who, as a widow, was defined as socially dead. The rituals of widowhood incorporated certain basic features, signifying the symbolic rejection/deprivation of the widow's sexuality. The rituals included the imposition of some visible mark to define and highlight this new status. Following the assumption of the new status the widow was relocated within the household of her dead husband. Unlike the marriage rituals, marking the women's entry into legitimate sexual activity, which are elaborate, the rituals marking the renunciation of the widow's sexuality are simple but always deeply humiliating and traumatic. The most dramatic and visible 'ritual' for brahmana women was the tonsure, or the shaving of the head. The unique practice of tonsure, prevalent among many south Indian and west Indian brahmana communities, requires some analysis of the notion of widowhood in brahmanical patriarchy so that we may unfold the cultural meaning of this highly symbolic act. It may be argued that to enforce permanent widowhood upon women the community needs to continuously reiterate its authority upon the widow; the enforced tonsure is a way of doing

that. It is a reiteration by the community of their power to control the widow's sexuality. Meyer Fortes and R Firth[2] have suggested that symbols, both private and public, constitute a major instrument of power when used directly or indirectly. This is true of the tonsure, which was deeply resented by widows and perceived by them to be an indication of their utter powerlessness in the hands of a cruel system, insisted upon by brahmana men.[3] Here the tonsure represents the social aspect of symbolic behaviour, referring to ritual processes by means of which symbolic ideas are acted out in term of real human interaction. That such actions are always highly formalised and ceremonial is evident in the removal of the hair of widows.

Widowhood is clearly a highly symbolised domain in the experience of upper caste Hindu society. While there are many elements of the widow's existence that are symbolised, there is an overwhelming concentration on the profound danger represented by the sexuality of the widow. The continued existence of the widow after the death of her husband was to convert what was most valuable to the husband in his lifetime into an awesome threat to his community. The theme that dominates the ceremonies and rituals of widowhood is the sexual death of the widow. And since the upper caste woman in brahmanical patriarchy is primarily a vehicle for reproduction, the sexual death of a woman is simultaneously a social death. The customs and rituals mark a social and ideological resolution of the tensions inherent in a conceptualisation of widowhood in which the widow continues to exist but is sexually a non-being.

II
Wifehood, Widowhood and 'Strisvabhava' in Brahmanical Patriarchy

From the evidence of the classical texts it is clear that the upper caste Hindu widow was an anomaly in traditional Hindu society, since she had no place and no function in the Hindu social order. The death of a woman's husband marked the transition from wife to widow, taking the woman from a central place in the family to its margins. In order to understand the upper caste widow's marginal/liminal place, it is thus necessary to look at the wife who is the obverse of the widow in the brahmanical texts.

Wife in Brahaminical Patriarchy

The wife is the most important focus of attention among the different categories of women in the prescriptive texts: symbols, rituals and norms are all concentrated in the person of the wife. A woman is recognised as a person when she is incorporated into her husband - only then does she become a social entity and in that state she is auspicious, a 'sumangali', a 'saubhagyavati'. It is therefore not surprising that marriage is the only ritual prescribed for women. Together with her husband she performs rituals and procreates a son or many sons.[4] These two acts define her as a social being, and for both the presence of the husband (who makes her complete) is imperative. Outside of the husband the wife has no recognised existence in brahmanical patriarchy.

The performance of rituals, and procreation, are acts in which women are perceived as agents or inferior partners through whom men discharge two of their three debts. The three debts are: to the sages, to the gods, and to the 'pitr'. The debt to the sages is discharged through 'brahmacharya', a compulsory stage that precedes marriage; the debt to the gods is discharged by performing 'yajnas'; and to the 'pitr' by reproducing sons.[5] The wife thus helps her husband in discharging two of the three debts, by associating with him in the sacrifice and by procreating sons. The role that the wife is assigned in participating in the ritual itself stems from the primary function of procreating sons. Manu states the relationship quite explicitly

> To be mothers are women created and
> to be fathers men, religious rites therefore
> are ordained in the Veda to be performed
> (by the husband) together with the wife[6]

While men discharged their debts and ensured their salvation, women helped men to achieve immortality and heaven through the son and thus discharge their obligation. The goal of the life of women was thus to get married and procreate sons – in fact, according to the texts women are created for the sole purpose of procreating sons.[7] It is not surprising that the *Dharmasutras* permit, or rather recommend, that the husband marry again even when the first wife was living if she had no son. The sonless wife should not be an obstacle in the fulfilment of the husband's goal.[8] That she was merely the medium through which the husband's goals were achieved and that she herself had neither personhood nor religious or social goals is evident from the denial of children (and through sons to immortality) to her in the event of her husband's death.

The rituals at the time of marriage explicitly recognise the crucial place of procreation. This is evident in the brahmanical texts,[9] and anthropological analyses of the Hindu marriage ceremony repeat the centrality of reproduction in the rituals so evident in the brahmanical texts. For example, in the crucial 'haldi' ceremony which precedes the actual marriage rites, the spouse is smeared with turmeric. According to informants the effect of the turmeric application is that the body is heated up for sexual intercourse. The source of sexual energy which *haldi* is believed to create is located unambiguously in women, in which sense they are perceived as active agents in the process of reproduction.[10] Further, the colour most often associated with brides is red. red is the colour of vitality because of its connotation of blood. It is appropriate where something important and life-giving is about to take place. The red colour of the 'kumkuma' and 'sindoora' applied only by married women symbolises the sexually active or sexually potent female. The bride's red sari and kumkuma together represent the fluids of creation, of life, female creative power, and specifically the capacity to bear children.[11]

It is significant that the symbolism of marriage rites represents women not only as a source of sexual energy, but also as having fertility closely identified with the fertility of nature and possessing qualities that are juxtaposed with other qualities supposedly held by men. However, these are held in such a way as to render them relatively 'wild' and 'disorderly'.[12] A concomitant of the ceremonies is that only in their relations to men as wives and mothers do they become fully cultural, or indeed fully human.

In handling the concept of wifehood the prescriptive texts too constantly attempt to resolve the basic contradiction that women represent between their nature and their function. A demoniac and innately promiscuous nature is ascribed as their lot due to the previous bad 'karma' that produces female birth; it must be suppressed in favour of their function as wives.[13] Women are perceived as being caught in a trap caused entirely by their karma; they are the sites of conflict between 'strisvabhava', their innate demoniac nature which is lustful, and 'stridharma', their function as wives. There is no greater delight and no more destructive urge than sex for women, and even very old women are considered to be consumed by passion. Women inherit 'svabhava' from their mothers while from their fathers they inherit their stridharma, their duties as women and their ordained functions as wives.[14] Thus a woman's biological identity is derived from the mother and her socially constructed identity is derived from the father.

The innate promiscuity of women requires the legitimate channelisation of their sexual energy in a stringently organised system of reproduction without which the social order would collapse. Thus to ensure the absorption of the wife's sexual energy frequent satiation is required, and the husband who does not approach his wife after the purificatory bath, following the end of the menstrual pollution, is to be punished.[15] This is a rare case of punishment advocated by the *Dharmasutras* to an 'erring' husband.[15] Even so, the innate sinfulness and lustfulness of women can easily lead them to adultery which is severely punishable with every form of humiliation to be publicly heaped upon the adulterous wife. Surveillance of the wife within marriage is regarded as necessary and is repeatedly recommended in the prescriptive texts.[16]

It was to channelise the overflowing sexual energy of women that early marriages become so crucial in the structure of brahmanical patriarchy. If a girl did not marry by the time she reached puberty she would easily and inevitably be led 'astray'. As Selwyn states, an unmarried menstruating girl eventually becomes an object of 'moral panic'. Such a woman, "untamed by wife-hood and mother-hood, is... a liability to her kin, her caste, and to society in general".[17] The brahmanical textual position is unambiguous in the responsibility it places on the girl's family if she remains unmarried after puberty.[18] The parents and the eldest brother go to hell in such a situation. If a girl is married after this point her husband

is to be socially excommunicated. According to some texts the father or guardian incurs the sin of destroying an embryo at each appearance of the menses as long as the girl remains unmarried.[19]

Marriage is thus imperative for women: within it alone can women's innate nature of sinfulness and lustfulness be channelised, and thereafter through legitimate reproduction women enable men to discharge their debts to the gods and ancestors and achieve heaven. Through wifehood and motherhood women discharge their functions in society, acquire personhood, and, in this capacity, perform rituals with their husbands as 'sahadharminis'. Within marriage as true followers of stridharma and 'pativratadharma', women can achieve great powers. Through marriage and wifely devotion the 'biological' woman, a wild untamed and disorderly entity, can be converted into the 'cultured' woman – a social entity who has vanquished all the demoniac force within her.[20] Only thus can women overcome the inauspicious marks of female birth and acquire the necessary karma to be reborn as men, preferably 'dvija' (twice born men) entitled to seek the goal of immortal heaven.[21]

The overflowing sexual energy of women, containable and legitimately expressible only in marriage, is regarded as assuming dangerous dimensions when the husband is away. Like the unmarried menstruating girl, a wife whose husband is absent is the object of moral panic. The didactic Sanskrit and Pali literature abounds in stories of women's licentiousness in the absence of the husband, thus bringing about moral and social disorder.[22] The way the prescriptive texts deal with this situation prefigures the manner in which the sexuality of women in widowhood is handled. All the advice given to wives to make themselves attractive and to invite the sexual attention of the husband are explicitly prohibited to the wife in his absence. Her movements are severely curtailed and so too her behaviour. The contrast in the prescription to the wife while the husband is home and when he is away is telling. While the texts prescribe a purificatory bath after her menstrual pollution is ended, she is exhorted to make sexual advances to him that night.[23]

But in contrast when the husband is away the 'chaste' woman – 'sati' – is expected to forgo perfumes, garlands, collyrium, the chewing of betel and even the use of the teeth cleaning stick. According to one authority the face of the wife whose husband is away should look pale and distressed, she should not embellish her body, she should be devoted to thoughts of her husband, she should not eat a full meal and should emaciate her body.[24] These traditional injunctions were repeated in the 18th century text for women which lays down that the woman whose husband is away "should abandon playing, adorning her body, attending gatherings and festivals, laughing and going to other people's houses, and even laughing with the mouth open".[25] These prohibitions are the general prohibitions observed by menstruating women and by widows. All these actions are regarded as making a woman attractive[26] and providing occasions for interaction with others, making the wife vulnerable to her own passions, and so must be avoided when the husband is unavailable either because he is prohibited to touch his wife, or is away, or is dead.

Widow in Brahmanical Patriarchy

As we have noted earlier the wife who becomes a widow creates an anomalous situation in the brahmanical prescriptive texts. Since the wife represents the core of womanhood she is the real focus of attention both in the prescriptive texts and in mythology. The texts concern themselves with converting biological entities into social or cultural entities. Once this ideal is achieved such women become prototypes and models for other women epitomising 'satitva', wifely power of the chaste woman. It is significant that there is no widow in traditional mythology except Kunti. But although she is important she is not central to the narrative in the *Mahabharata*.[27] The only woman who comes close to such a position is Savitri who is doomed to widowhood in the narrative. But the focus in the story is how Savitri fights off her husband's death. By implication the narrative lays the groundwork for the widely held belief that women who are widowed fall into that state because they bring it upon themselves. To that extent they are responsible for the death of the husband.

The mythology of chaste wives who predecease their husbands is consistent with the general position in the brahmanical prescriptive texts that widowhood is solely attributed to 'purva karma' and is the punishment for a sinful existence in the past. A true pativrata can never be widowed because she will never leave her husband even in death. She will either die before him as a 'sumangali' or will accompany him in death.[28] Indeed the wifely power of the pativrata lies in a woman's ability to snatch her husband away from the jaws of death as Savitri did with Satyavan; the texts tell us that just as a snake charmer forcibly draws out the snake from its hole, so too the spiritual power of the pativrata snatches away her husband from the messengers of death and reaches heaven with him. On seeing such a pativrata the messengers of death beat a hasty retreat knowing that they have been thwarted by her devotion.[29] The proper ideal type of a woman in the brahmanical texts is one who is imbued with the qualities of a sati. She is a woman whose chastity makes her a living sati and gives her the power to ensure that she dies before her husband. Alternatively if her husband dies before her she has the power and will to accompany him in death as a sati and thereby reject widowhood.

This is the background to the religious sanction for sati, the immolation of the wife to overcome widowhood. All the major texts exhort the wife to accompany her husband in death by performing 'sahagamana' or 'sahamarana'. The husband is to be followed always: like the body by its shadow, like the moon by moonlight, like a thunder cloud by lightning. In order to achieve this state the wife is prepared for such an action right from the time of the marriage vows.[30] There is no doubt that the woman who gladly follows her husband from his house to the cremation ground attains, with every step, the rewards of the horse sacrifice.[31] The woman who rejects widowhood can purify and rescue the most sinful and evil husband. Even if the woman has been a bad wife, who has until then, because of her wicked mind, despised her husband, even she, through the act of dying with her husband, confers merit on themselves. It destroys her earlier sin even when she does this out of anger or fear. This then becomes the scriptural justification for forcing women to burn themselves. It is the ultimate and only effective 'prayaschitta' for the bad wife; though this she redeems herself and escapes the future misery which her bad karma would normally have brought her.[32]

Following these arguments it is clear that according to the ideology of brahmanical patriarchy, if a wife is actually widowed she has certainly not been a pativrata, nor vanquished her innate weakness and sinfulness (which her birth as a female entails), nor availed of her last chance for redemption through satihood: in short she is an outcaste. She is therefore a doubly condemnable creature: feared and despised. The widow must thenceforth atone for her sins, for bringing widowhood upon herself: through bodily mortification and steadfast devotion to her departed lord she must stringently monitor her sexuality and master the promiscuity that inheres in all women. To enable others to have proof of her virtue she must occupy the darkest recesses of the house and submit herself to the constant surveillance of the patriarchal gaze, even as it might work through the women of the household, with everyone committed to upholding notions of family honour inscribed into the gender and caste codes.[33]

Widow in Prescriptive Texts

Since a woman becomes a social entity only when as a wife she is united with her husband, the death of her husband represents the cessation of her social existence and the end of her personhood. Once the husband dies the wife's sexuality, which in marriage served familial and social goals, is of no use to the community. The death of the husband thus marks a dramatic shift in the perception of the community towards the widow. Even more than the unmarried menstruating girl or the nubile wife whose husband is away, the widow of the dead husband is the object of real moral panic. While the sexuality of these other categories can be held in abeyance, the sexuality of the widow cannot; she must therefore be completely unsexed. And because this is not easy to achieve the widow must be represented as the most repugnant and despicable of characters. Feared and hated she must henceforth be confined to the 'dark spaces' where she is inaccessible.

The prescriptive texts lay down stringent codes of behaviour in order to ensure that the widow's sexuality is repressed, mastered or forcibly contained. These prescriptions are outlined in all the major texts beginning with

Manu, until which time the texts had recognised the possibility of redeploying the sexuality of the widow after a specified period of celibacy and mourning. The institution of 'niyoga' or levirate unions is mentioned in the *Rig Veda* and survived into the first millennium A D. However, the *Dharmasutra* literature indicates that the practice was being made conditional upon the absence of a son from the woman's first husband and had to have the sanction of the elders in the family.[34] Manu condemned the practice and upheld the norms of a celibate and perpetual widowhood. Following Manu, the emergence of the norm of celibacy became the basis for all the individual prescriptions; the widow must give up all ornaments, observe fasts, emaciate her body and remain steadfastly loyal to her dead husband. Manu lays down the following code:

> Let her emaciate her body by living on pure flowers roots and fruits; but she must never even mention the name of another man after her husband has died Until her death let her be patient of hardships, self-controlled and chaste and strive to fulfil that most excellent duty which is prescribed for wives who have only one husband "

The *Vridha Harita* is more explicit about the marked nature of the widow's appearance and behaviour, "She should give up chewing betel nut, wearing perfumes, flowers, ornaments, and dyed clothes, taking food from a vessel of bronze, taking two meals a day, applying collyrium to the eyes; she should wear only a white garment, curb her senses and anger, and sleep on the ground."[35]

The prescriptive texts provide only one model for the widow who continues to live after her husband, and that is the model of an ascetic widow This model closely corresponds to two other categories of males in the brahmanical texts who, like the widow, must transcend or renounce their sexuality: the brahmacarya' and the 'sannyasi'.[37] The first is a male who has not yet entered an active sexual phase, and the second is a male who has renounced sexual life after completing his duties as a householder and begotten sons, and is therefore free to pursue his salvation goals [38] For both these categories celibacy is compulsory and underpins all the codes to be followed. Indeed the widow's way of life is specifically called the renouncer's life, or in the widest sense a celibate life. But there is a crucial difference because the widow cannot leave home as a true renunciate.[39] Unlike the true 'pravrajya' she has no individual salvation goals apart from those of her dead husband. The widow's asceticism, bearing no personal results equivalent to the male ascetic, i e, cessation from rebirth or 'moksha', is nevertheless necessary in order to ensure the peace of mind and happiness of her dead lord. Devotion and loyalty to one's husband remains the key point of a widow's life; the widow's asceticism and celibacy is thus negative, not positive. Her 'stridharma' continues in widowhood and requires her to master her sexuality. It will ensure her salvation by ensuring her husband's salvation, otherwise he will descend to hell.[40] For this reason the widow's celibacy is not transient but must last as long as she lives. Thus, although there is certain similarity in the asceticism of the widow and that of the renouncer, the goals are so distinct that the widow is not an ascetic: the transformative space available to women within the ascetic tradition[41] is denied to the widow.[42]

In brief, the prescriptive texts clearly outline only two models of widowhood: that of the dying sati who mounts the pyre rejects widowhood, and proves herself to be the best follower of 'stridharma', and that of the living sati who becomes the ascetic within the home, remaining a celibate, steadfastly devoted to the husband till she dies. There is no third model, certainly not of the true renunciate, at least in the brahmanical prescriptive texts.

The two models of the dying sati who mounts the pyre, and of the living sati who mortifies the body, are repeated throughout the centuries in all the later texts of the brahmanical tradition. Of the two, the first remained the more valued ideal for a variety of reasons. The devotion of the dying sati who mounted the pyre, and the merits such an action brought to her relatives, were no doubt greater than those of the ascetic widow But at the same time it must be remembered that the sati also solved the problem of the sexually active woman whose sexuality must not be expressed. The hazards of the sexually active widow forced into celibacy was ever present in the texts.[43]

In the 18th century Tryambaka took an unambiguous position on the issue of the sati versus the ascetic widow The practice of dying with the husband was commended for all women. But its, for some reason, the wife did not follow her husband then Tryambaka exhorts that her virtue must be protected for, as he puts it, if her virtue is lost the woman falls down into hell. More important, the loss of her virtue causes her husband to fall down from heaven into hell [44] The rewards for good behaviour are both material and spiritual. The ascetic widow gains heaven for herself and her husband Further, she ensures rebirth as a high status man for herself Only the chaste widow is entitled to maintenance or the enjoyment of property during her life time. According to Katyayana, "A sonless widow, preserving the bed of her husband unsullied and being self-controlled should enjoy her husband's property till her death."[45] (This position was upheld in judgments in the 18th and 19th centuries).[46]

The limited and conditional rewards, one necessary for her survival and the other to secure an unseeable future, go along with an otherwise humiliating existence. While the rules regulate minutely the widow's conduct, it is clear from references that the lawgivers could not effectively restrain men from violating the injunctions regarding strict celibacy for widows. The *Adi Parva* (of the *Mahabharata*) recognises that "just as birds flock to a piece of flesh left on the ground, so all men try to seduce a woman whose husband is dead."[47] Taken together, the inherent sinfulness of women, their lustfulness, as well as the predatory character of men, required the segregation, isolation and marking of the widow.

It is in the context of the above discussion that the rites and customs associated with widowhood acquire meaning. These rites and customs were prevalent in different degrees in the case of most widows, but were highly concentrated in the person of the high caste Hindu widow and included the rite of tonsure. Control over female sexuality was almost obsessively applied among high caste women because the danger to the structure of brahmanical patriarchy was great in their case. The reproduction of the hierarchical caste order with its horror of miscegeny subverting the entire edifice necessitated such stringent control. Unlike the lower caste woman the high caste woman did not labour outside the home or participate in primary production. She was regarded solely as a receptacle through whom reproduction could take place. The death of the husband of the high caste woman and the consequent cessation of her reproductive potential created a dangerous situation. The anxiety about monitoring her sexuality doubled: while, as we have seen, the wife's sexuality had to be channelised, the widow's sexuality had to be abruptly terminated. The rites reflect the dramatic transition from one stage to another, from a controlled and channelised sexual life and social personhood to sexual death and social obliteration.

Symbolic Structure of Widowhood

The passage of a woman from the position of a wife and sahadharmini to that of a widow was marked by various rites. These rites are not the subject of sustained attention in the early sacred texts as the focus of attention was concentrated on the male corpse However, the texts do indicate that soon after the death of the husband, the appearance of the widow was distinctly marked off from other women as she had to give up all forms of adornment as well as those customs or symbols that were associated with the marriage of a woman. These include the 'kumkuma', the red mark on the forehead, the 'sindoora' applied in the parting of the hair in certain parts of India, and the use of 'haldi', among other banned items. These items as we have noted before are associated with sexuality and reproduction. Haldi, for example, has a strong relationship with fertility and prosperity and is considered so auspicious and powerful that 'naturally' widows could not be allowed to use it.[48]

Other customs not specifically mentioned in the texts are also widely prevalent, such as the breaking of glass bangles and the breaking of the 'mangalsutra', the sign of a married woman in many parts of India.[49] These acts are performed with a degree of violence which adds to the humiliation the widow must undergo for the rest of her life and which she begins to experience immediately after the death of her husband. Two other markers of widowhood are the white, ochre, or occasionally maroon coarse garment prescribed for widows, and, among the high castes in southern and western India, the tonsured head. The colour codes of red and white are systematically sustained in the wife/widow opposition Whereas red

symbolises fertility and sexuality, white symbolises asexuality In the place of the red kumkuma banned for widows it is customary for them to use 'vibhuti' or ash instead to mark their foreheads The white or ochre sari symbolises purity, coolness and the sexuality of the non-bride, more pertinently the renouncers. White is also the colour of death; the 'vibhuti' or white ash is associated with the funeral pyre,[50] and the exclusive use of this colour by widows among women indicates their continued association with asexuality and death [51]

The ritual of the tonsure marks a more extreme resolution of the asexuality of the widow It is significant that there are no references to the tonsure of widows in the early prescriptive texts On the other hand these texts rule that the widow should not adorn her hair with flowers and must keep it bound, so it is obvious that tonsure was not prescribed initially, and certainly not for all castes There is every possibility that widows of the royal families kept it unbound during the period of pollution and mourning. Unbound hair appears frequently as the sign of widowhood in the *Mahabharata* When Draupadi kept her hair unbound for 12 years she was symbolically proclaiming a state of widowhood and mourning [52]

As a custom, the tonsured head appears to have been taken over from a very early practice among the Tamils The Purananuru, a 2nd century AD text, portrays widows as subject to many restraints: they did not wear ornaments, slept on beds of stone, and caked their shaved heads with mud.[53] The custom is mentioned in the Sanskrit texts for the first time in the *Madanaparijata*, a commentary on the *Skandapurana* written in the 14th century [54] The text states that the widow, like the son of the deceased, had to shave her head Up to this point in the account the widow is depicted as sharing pollution or mourning along with her sons [55] However the text further states that widows were required to tonsure themselves continually at periodic intervals till their deaths[56] whereas the sons are not required to do so The 18th century Tanjore text, the *Stridharmapaddhati* of Tryambakayajavan, argues that the rules prescribing shaving the head apply only to brahmana widows while women of other castes kept their hair.[57] In 18th century Maharashtra the state enforced it in the case of brahmana widows,[58] and the custom was widespread among brahmana widows in Maharashtra, Tamil Nadu and Karnataka

The notion that sin and pollution both lodge in the hair appears to be widespread; it is for example a ubiquitously held belief among Hindus and has been documented in the case of the Hindus of Banaras [59] It is for this reason that funeral rituals require that on the last day the hair is shaved off, thus ensuring the removal of the pollution. Normally, in more everyday occasions of pollution the ritual washing of the hair is considered enough However death pollution for the upper castes requires more effective forms of ending the pollution (as in the shaving off of the head) [60] In the case of the widows, however, the requirement of periodic shaving must necessarily have other connotations than mere death pollution.

Anthropological evidence provides us with some clues to the relationship between hair, pollution, and sex Paul Hershman's field observations of hair grooming practices in Punjab shows that such practices are particularly important in the case of women [61] A similar notion of pollution is prevalent even where tonsure is practised. It was enforced by the popular belief that if the widows did not shave her head, every drop of water which fell upon the hair polluted the husband's soul as many times as the number of hair upon her head [62] Hair is thus a major marker of the state of pollution or purity and auspiciousness and the possible shift from one to the other, especially in the case of women

In this context of the symbolism regarding hair, it is notable that of all the parts of the body hair has the most mystical association There is hardly a culture in which hair is not for males a symbol of power, manliness, freedom It is the seat of strength in many myths and cultures, the most well known being the case of Samson It is also held to have fertilising powers as evident from Greek myths At puberty the hair, already the seat of strength, is considered to be enhanced and containing a double portion of vital energy, since at that point it is an outward manifestation of newly acquired power of reproducing the species Abundant hair is a sign of vigorous sexual energy, idealised as the essence of feminine beauty but indicative also of wantonness in the case of women [63] Since abundant hair is a symbol of life power, the way one handles it is a marker of what one does with this life power The grooming or exhibition of hair, for example, has a pronounced erotic element in Melanesia [64] Shorn head is conversely symbolic of the loss of power, freedom and even of castration

While Berg has analysed the unconscious meaning of an individual's community's attitude towards hair, Leach[65] and Obeyesekere[66] have, on the other hand, explored the symbolic structure of hair and its relationship to sexuality in the context of renunciation, asceticism and sexual restraint Both argue that symbols have meanings at different levels, and that apart from their personal meaning for individuals and groups they have a socio-cultural message which is public Leach argues that while the private has indeterminate meaning, the essence of public symbolic behaviour is that it is a means of communication in which the actor and audience share a common language – a symbolic language, every member of a certain culture will attribute the same meaning to any particular item of culturally defined symbols.[67] Leach and Obeyesekere thus contest Berg on the unconscious symbolism of hair On the basis of anthropological evidence from south Asia they argue that hair behaviour embraces a widely understood set of conscious sexual symbolisations It is because of this that hair plays such an important part in rites of passage involving the formal transfer of a person from one social-sexual status to another.[68]

The tonsured head both in the case of men and widows is clearly a public symbol, one that is recreated each time upon an individual. It is also part of a larger symbolic set in which the tonsured head, the half-shaven head of the brahmanas, and the matted hair of the ascetic, have different but related meanings; they are all linked up within a unit of specific cultural meanings attributed to hair and sexual behaviour.

In the case of the shaven head Obeyesekere and Leach accept Berg's analysis of the unconscious meaning of hair as symbolic castration. Leach argues further that allowing the dishevelled state is an ascetic repudiation of the very existence of sex. Referring to the practice of keeping a young girl's hair short in Assam and Burma, whereas married women wear their hair long, he suggests that short-haired women are those whose sexuality is under restraint [69] Similarly the elaborate half-shaved half-haired head grooming of the brahmana indicates the simultaneous control of sexuality and the legitimate raising of offspring In the symbolic system of brahmanism, the tuft means sexual restraint, the matted hair means total detachment from sexual passions and the shaven head means celibacy At leat in south Asia, then, sex behaviour and hair behaviour are consciously associated from the start [70]

Obeyesekere argues strongly for a sharp distinction between the shaven head and matted hair, which according to him are not interchangeable as their meaning is not confined to chastity alone. It is only the shaven head that implies castration, although it at the same time implies chastity and renunciation. The difference between the shaven head of the buddhist monk and the matted haired ascetic is indicative of the gradations within restraint in sexual behaviour. In the case of the celibacy of the monk, sexual passion must be eliminated, not just held in abeyance, as in the Shiva mythology, the archetype of the symbolism of matted hair The biologically obvious way for the complete elimination of sexual passion is castration. Coming close to that is expressing it indirectly and symbolically through a non-literal interpretation as an tonsure Obeyesekere concludes that the primarily psychogenetic meaning of the shaven head is castration, its further cultural meaning is chastity, and its extended interpersonal meaning is renunciation. While all three meanings are contained within the act of tonsure for widows, the most important level of meaning is that of castration.[71]

The tonsure of the widow with its attendant meaning of castration, chastity and sexual death, was at the same time a visible marker of the widow's entry into a state of social death. For the upper caste widow sexual death was social death as there was no other role assigned to her apart from that of reproduction. Such an ideology entailed the enforcement of grim conditions upon the widow's existence. Symbols and rituals of marriage and widowhood along with material arrangements affecting widows were linked together to form a structure that governed the lives of upper

caste widows which survived into the 19th and 20th centuries.[72] This structure had a counter but complementary set of relations which applied to lower caste widows, as the field based studies analysed below demonstrate.

III

Material Relations and Ideology of Widowhood: Two Case Studies

Widowhood in a South Indian Brahmanical Community

Anthropological analysis of the belief structure of a brahmana community with regard to gender relations provides a case study about latent ideas on widowhood among havik brahmanas in the Malnad area of south India.[73] The study uncovers complex emotions of fear and guilt located within a structure of power in which men wield total authority over women who are completely dependent economically upon, and subordinated to, them in every way: the most vulnerable section among women are widows. The study suggests that those who wield power over others in real life invert the actual relations in their belief system and portray as malicious and dangerous the very people over whom they wield power, as in the case of havik brahmana men and havik brahmana widows. At the same time the study shows that such beliefs are unique to havik brahmana society, and are absent among those communities in which gender relations are relatively less authoritarian and women have relatively higher status within their caste than do havik women.

It is believed by havik brahmanas, among whom widows occupy the lowest status position, that these widows poison others at random with a substance obtained secretly by them from a strange reptile. Widows without male issue are particularly suspect. The victim is said to develop an incurable stomach ailment leading to a distended stomach. In young women the symptoms approximate to a pregnancy; treatment is not usually secured till it is too late. A number of havik brahmana informants hold that widows poison others to ensure that in their next incarnation they will have many sons and will predecease their husbands.[74] The implication appears to be that brahmana widows are unhappy in this life and many perform a harmful act in order to be happier in their next one. What is significant is that the alleged victims are not selected for purposes of revenge or hatred; the widows act not against someone but for themselves to secure a different and better future than the one in which they have been widowed and subjected to infinite misery.

Havik brahmanas occupy the highest position in society in those villages where they reside and derive their livelihood from the possession of small areca-nut plantations and from land that they lease to agricultural castes. Since havik brahmanas never accept food from any other caste their poisoners have to be members of their own caste. Only widows are believed by the havik to at some time or other have been suspected of indulging in the practice. The deep seated belief may be interpreted as representing the destructive potentialities of havik brahmana widows. According to Harper the fear itself can only be explained in the context of havik social structure, especially its gender relations.[75]

All women, but particularly widows, are feared by havik men. Women are a potent source of pollution for havik men for whom ritual defilement is a major concern. Menstruating women and women who have recently given birth to a child – in other words women in states which emphasise their 'femaleness' – must be segregated. Even inadvertent contact with them causes much greater ritual pollution than does contact with a member of the untouchable castes. In a state of ritual impurity women can cause untold harm to their families, and should an impure woman accidently contaminate a god or deity it may cause illness or even death to members of her family.[76]

At a more general level all women are inherently dangerous because they are sexually passionate and demanding; as temptresses of the flesh they sap male vitality and stand between brahman men and their salvation goals. In the context of everyday relations women are believed to disrupt fraternal solidarity, a cherished ideal among havik brahmana men but hardly ever actualised in real life, and not because of women; this is a stereotype which, in Harper's view, has no bearing on the break-up of the fraternal household.[77] But it is brahmana widows who are most feared amongst women. The sight of the widow itself is inauspicious, so inauspicious that if sighted at the beginning of an auspicious venture, the venture must be postponed, even dreaming of a widow augurs ill. Further, in the system of religious beliefs all female deities are in general more dangerous and malicious than their male counterparts. Mariamma, the goddess of small pox and the deity who has the highest malevolence potential, is in local mythology represented as a brahmana widow. It is of utmost significance that 'according to the narrative she slew her husband in a fit of rage when she discovered that she had been deceived by him. Mariamma thus became a widow by murdering her own husband. This is clearly linked to a deeply held belief in brahmanical society that should a husband predecease his wife it is somewhow, in some mystical way, the wife's fault.[78] The belief in poisoning by widows is thus part of a more complex constellation of ideas around the theme of fear of women, but particularly widows. In the havik brahmana household the authority of the males over females is absolute. At marriage, performed ideally before puberty, authority over the bride is completely transferred from her natal family to her husband's family. Post-marital residence for women is virilocal and patrilocal for men, women are excluded from inheritance and, except for certain types of jewellery, women do not own property.[79] Divorce is prohibited, polygamy is permitted but rare, widows must never remarry, widowers are expected to remarry and often do. Since at marriage a woman is transferred from one patrilineage to another, her natal kinsmen have no jural control over how she is treated. A mistreated daughter-in-law (who as a bride occupies a low status and power position within her new house, where the male kinsmen have a right to discipline her severely) should not complain to her natal kinsmen because this would only cause them grief about a situation over which they have no control. The only recourse she has is to bring dishonour upon her husband's family through suicide. It is not surprising then that all havik families prefer to marry their daughters to less wealthy families in order to maximise their influence over their daughters' new social environment.[80]

Havik women labour only within the household unlike women of nearly all other castes in the region, who perform agricultural labour. Also, they do not handle financial matters. Havik males characterise women as weak willed, superstitious and constantly in need of male protection. Prohibited from possessing sacred religious knowledge they are characterised as having 'sudra minds'.[81] The perception about the subordination of women and girls around havik men expresses itself in a dual manner; positively with regard to comprehension and behaviour towards daughters and negatively when it constructs widows as malevolent.

Havik men hold deeply ambivalent and contradictory attitudes towards women. Mothers are revered, sisters and particularly daughters are regarded as dependents towards whom there is much affection. Harper argues that the havik male fear of women is linked to guilt about the subordinate status of females to males. This recognition of status difference accounts for the compensatory behaviour exhibited towards daughters — the expressed sentiment is that because daughters may suffer after marriage they must be made as happy as possible before the event.[82] In the value system of the male havik there is thus a great disparity between the attitudes expressed towards wives and women in general, and towards close agnatic kinswomen.

The fear about wives in particular is evident also in the way in which every structural mechanism, ideological and organisational, is used to prevent women from uniting in opposition to the male dominance within the marital household. Women from the same patriarchal family are barred from marriage into one household; indeed brothers should not marry girls even from the same village. These conventions prevent sisters, female patrilateral parallel cousins and childhood friends from residing together in the same house after marriage. The bride's isolation in the new house must be complete for the subordination to be effective. The life cycle of women has, however, a certain progression even within the husband's family. After a period of trial and tribulation occupying the lowest position in her husband's family, a woman may, and often does gain, in respect, especially when she produces a son. She may ultimately become a mistress in her own house and a mother-in-law with power over her daughters-in-law. Time thus appears to be in her favour.[83]

But as Harper points out, if she is widowed, especially without having borne a son, even time cannot lift her out of her oppressive situation. She will be permanently deprived of even the little she had as a wife - a husband and children. Forced to wear a distinctive garment and tonsure her head to symbolise her degraded status, she is publicly defeminised. More offensive than anything else, the widow is never again referred to as 'she' but instead by the neuter 'it'. Widows are ridiculed and commonly they are the butt of jokes. From then on the widow is called 'prani', animal.[84] A symbol of inauspiciousness, she can no longer participate in the domestic ceremonies that form a part of women's culture. Everyone concedes that the life of the widow is one of unalleviated misery. But this does not merit real sympathy. The fate that befalls a widow is believed to be deserved. Expected to pray daily that she should predecease her husband, a woman if widowed is considered to be at fault. "It ate up its husband", is what people would say.[85] Any move up or relatively high status that she might have gained through time is instantly diminished. That havik society would regard widows to be sufficiently bitter and resentful to harm others in order to escape (in future) the sufferings entailed in widowhood is thus entirely 'rational'.

In the larger structure of relations governing caste, gender, widowhood, and belief systems, there is a crucial but inverse connection between the real position of the widow's powerlessness and their imagined power to strike back. The subordinated status of the woman as widow is expected to breed the desire for revenge. The overt submission of widowed women is perceived as a mask which hides their suppressed anger and makes them infinitely dangerous, in some cases even blood-thirsty.

It is notable that the structure of ideas with regard to widowhood among brahmanas grows out of the material and social position of widows in high caste society. In marked contrast, widowhood is not pitiable, nor are widows regarded as particularly dangerous among the different categories of women in the lower castes. Widowhood is not marked by the kind of dramatic break in the life of a woman as in high caste society, it is a different state but the structural opposition between the wife and the widow does not exist in non-brahmanical society. Widowhood is organisable in the case of the non-brahmana castes, along the axis of production and reproduction rather than reproduction alone. Widows from these castes are thus incorporated in the social and economic order. This is strikingly brought out if we look at the labouring castes who work for the havik brahmanas in the Malnad region. Post-marital residence in the case of the labouring castes is determined by individual economic factors and sometimes may even be in villages where neither the man nor the wife has close ties but where work is available. Extended families are not glorified among sudras as among the haviks. Among untouchables the extended family is almost never found. Post-puberty marriages are the norm and divorce may be initiated by either party. Family authority is more equally divided between the husband and the wife; women earn and handle family finance. Menstrual taboos are less rigorous, and payment of a brideprice frequent.

Sudras and untouchable widows do not shave their heads, nor are they set apart by distinctive dress nor referred to as animals, nor excluded from auspicious ceremonies. In these castes widows and divorcees may and do contract second marriages. The status of a woman who enters into a secondary marriage is only slightly less than that of a virgin bride. It is significant that non-brahmana widows in the Malnad region are absorbed into productive and reproductive activities (if they are in such an age group); women's status is relatively higher in their own caste than is the case with havik women, and unlike the latter they are not considered dangerous or inauspicious.[86]

Widowhood among Low Caste Labouring Groups in North India

The manner in which material and social factors differentially organise conceptions of widowhood is examined and analysed at length by Pauline Kolenda in the context of a north Indian village. Kolenda's essay is comparative with regard to region and explores the connection between present practice and historical texts which make references to widowhood, the levirate and remarriage of women.

Kolenda examines widowhood among high caste rajputs an low caste chuhras in a north Indian village.[87] Drawing from other anthropological works especially on south India, she notices that widowhood as well as the status of women in the high castes is related among other things to control over property inherited by men, which may foster the degradation of women in order to exclude them from a share in inheritance. Ideologically this is portrayed as women being 'assimilated' to their husbands and becoming one flesh with them. In contrast, the lower caste women are not 'assimilated' to their husbands but in marriage remain equal and opposite to them. An important factor responsible for the differences between high and low castes is the contrast between high castes as landowners and the low castes as wage earners. There is here an equality between adult sons and father, and between husband and wife, which comes from their separate and more or less equal status as wage earners. The lower caste woman's economic role accounts for her more equal rights both in her marital and natal homes. Thus the difference between high caste and low caste women is caused by differences in relation to production.[88]

Kolenda carries forward the analysis of gender, caste and the economy with a close look at widowhood but particularly relating to enforced widow mating among low castes. To begin with, chuhras do not necessarily follow patrilocal residence. In their case there is much flux in the population as families change residence, chuhra families may settle in the wife's village or other villages where one might find kin, or just a place where work is available. Lack of land has resulted in the chuhras being more mobile, less anchored to locality than the high caste rajputs in the area. Because of their poverty chuhra women work outside the home, it is they who do the 'jajmani' work. A chuhra widow could support herself and her children as long as she could continue the jajmani work. There was no dramatic change in the chuhri widow's lifestyle or standard of living.[89]

The rajput widow on the other hand was stripped of jewels and remained in her dead husband's property contingent only upon her 'good' behaviour, and was forbidden to marry again. Only one sexual partner was envisaged for a rajput woman during her lifetime and that was her husband. To him she was given in sacred ceremony, with community sanction and a dowry. A woman along with her family was made impure by any subsequent sexual relationships she might have. An adulterous rajput wife or widow could be cast out and even executed. Sati was an ideal, and worshipping at a sati shrine was the first ceremony in every marriage of a rajput woman.[90]

The main contrast between rajput women and chuhra women is with regard to work, marriage, and widow mating. All chuhra women, along with other sudra or untouchable castes, could remarry, and the practice of levirate was common among these castes. In the structure of ideas widow-remarriage is one of the key defining practices that constitute the impurity of low castes. But, significantly, as has been documented elsewhere, low castes were expected to conform to the custom.[91] The insistence of such a practice was in part a reinforcement of closely guarded upper caste privileges including enforced widowhood which ensured higher ritual status for them. But it was also a means by which the upper castes manipulated and controlled the demographic structure of all castes - high and low. Patriarchal formulations were closely tied to caste and class formation.

That caste, class, and patriarchy worked together to organise the sexuality of all women is evident from widow mating practices among the chuhras. Chuhri widows of child-bearing age were expected to remate. Only widows with grown children, i e, one who was well past child-bearing age, was permitted to remain unmated if she made a declaration to the community to be a celibate.[92] This was not a recognition of the sexual needs of widows but an arrangement to utilise the productive and reproductive labour of widows. While maintaining land structures intact as among agricultural castes such as the jats (who were restricted to levirate widow-marriage), such an arrangement would ensure the full productive potential of a woman to ensure maximal replenishing of the labouring and servicing castes.

Key elements in chuhri widow mating were a hierarchy of mating patterns according to the distance of the second mate to the dead husband, and a set of rules for the disposal of the widow's sexuality. The power to dispose of a widow's

sexuality lay with the patrifraternal contingent of her husband's paternal family. The preferred mate to whom the widow will be assinged is the dead husband's unmarried younger brother. If there is no unmarried younger brother she may be assigned to a married brother with his, his wife's, the widow's, and the widow's father's consent. She may be also given to a patrilateral parallel cousin or a matrilateral cross-cousin of the dead husband, but here too her consent as well as that of her father is required. In the case of the latter the new mate must pay for her. Both the patrilateral parallel cousin and matrilateral cross-cousin have the right to sell her once she has mated with them. A married woman or a widow who commits adultery can also be sold. Once a woman is sold she may be re-sold repeatedly.[93]

The hierarchy of marriage types are (1) marriage by 'pheras' (the first marriage); (2) secondary marriage to husband's brother; (3) secondary marriage to husband's patrilateral parallel cousin; (4) being sold to a man who is a matrilateral cross-cousin of the husband; and (5) Being sold to a stranger.[94]

It is evident from the above summary that despite the relative economic independence and security of the chuhri women, it did not make them "close to equal to men"[95] as Kolenda establishes so decisively, the men could pressure her to take another mate and they could even sell her so that she was separated from her kin. Her inferiority was established through the mating rules but more so in the rules regarding the buying and selling of widows. Control over the sexuality and the labour of the widow lay not with the widow but in the hands of the husband's family. Kolenda's analysis of chuhri widow mating customs also considers the relationship of such practices to textual evidence, and she suggests that the customs among low castes are not an aberration accountable to unsanskritic patterns, but rather are an archaic survival of prevalent mating patterns before the brahmanical codes proceeded to lay down definite and distinctive sexual codes for different categories of women.[96] While they prescribed ascetic widowhood, deterministion and the sexual death of the upper caste widow and thereby raised the status of the entire caste in relation to others, they characterised widow matings,[1] conceptualised in the practice of niyoga (the traditional term of levirate) as fit only for 'cattle' and sudras.[97] It then became a crucial index of caste status in a deeply hierarchical order. The reproductive practices of the labouring classes were simultaneously castigated and utilised; multiplying cattle and those who must labour was consistent with the brahmanical caste order. Patriarchal formulations for women of the high caste and women of the low castes were structurally integrated into the ideology and material relations of the caste system. The high castes were required to restrict reproduction so that pressure on resources in their control were not strained. Equally, since they did not labour the increased reproduction of the labouring classes would expand the potential to exploit resources under the control of the upper castes. Chuhri widows like all low caste widows were socially subordinated but did not face sexual death (or social death) at the death of their first husbands; the chuhri widow was the structural opposite of the brahmana or rajput widow who faced sexual and social death when her husband died. While enforced widowhood was the rule among the high castes, enforced cohabitation maybe said to be the rule for widows of the lowest castes.

The apparent difference in widow marriage and widow mating patterns between high castes and low castes may lead to the conclusion that there were different patriarchies according to the respective caste status. This is only partly true because it needs to be stressed that these differences were arranged within a larger single conceptual and material organisational structure. Within the larger rubric of a brahmanical patriarchy, caste, gender, land control and demography were tied inexorably together both conceptually and in terms of material and social arrangements.

Notes

[This paper was first presented at a conference on 'Widows in India' held in March 1994 at the institute of management, Bangalore. It will form part of a volume on widowhood in India edited by Marty Chen and Jean Droze. I am grateful to Patricia Uberoi for comments on an earlier draft of this paper as well as for drawing my attention to certain anthropological writings on the symbolism associated with hair. I am also indebted to Gerda Lerner for extended discussions on gender which have helped to shape some of the arguments in this paper.]

1 I have made a free and associational use of this term borrowing from Orlando Patterson's classic work on slavery. Although the upper class widow was far removed from the slave someone who was uprooted from family and alienated from her/his culture – I find the concept of social death useful in capturing the peculiar status of the widow that of a non-being. The social death of the widow made her permanently into a non being, an indelibly defective state which weighed endlessly upon her destiny, someone who could never be brought to life again. Orlando Patterson *Slavery and Social Death: A Comparative Study*, Harvard University Press, Cambridge 1982, p 38.

7 Narada, *Stripumsa*, V 19, cited in Kane, *HDS*, p 561. As early as the *Satapatha Brahmana* it is said that a sonless wife is possessed with *Nir-rti*, ill-luck or destruction.

8 *Apastamba Dharma Sutra*, II 5 11 12-13, translated by George Buhler, *Sacred Laws of the Aryas*, Motilal Banarasidas, Delhi, 1975 (reprint).

9 According to the marriage rites of the *Asvalayana Grhyasutra* (173-18) the husband leads the wife thrice round the fire and the water jar (a symbol of fertility) keeping their right sides turn towards it and murmurs "I am heaven thou art the earth, I am 'saman' thou art the 'rk', let us both marry here. Let us beget offspring" (Kane, *HDS*, pp 528-30).

Later when the bride enters her husband's home the husband chants "here may happiness increase to you through offspring". Then he kindles the nuptial fire and as his wife is seated on a bull's hide he makes oblations chanting "may prajapati create offspring to us". As the bride enters her husband's house she breaks her silence and says "may my husband live and may I secure offspring"; Kane, *HDS* op cit, p 530.

The rites that relate to the 'garbdhanam' or the 'chaturthikarma' ceremony performed before the marriage is consummated follow the first menstruation of the girl. After the wife has bathed, her husband makes her pound rice which is then boiled and eaten. Then the husband fills a water jar and sprinkles the wife thrice with the water and repeats certain mantras.

> May Visnu ready your parts, may Tvasta frame your beauty, may Prajapati sprinkle and may Dhata implant an embryo unto you. May the Asvins plant in thee an embryo. As the earth has fire inside it, as heaven has Indra inside it, so I plant a garbha in thee.

Brhad Aranyaka Upanishad, VI4 13, 19-22.

In the rite of the 'chaturthikarma', three nights after marriage the husband performs certain acts and murmurs, "into thy breath I put the sperm, may the male embryo enter the womb as an arrow into the quiver, may a man be born here, a son after ten months"; Kane *HDS* pp 202-03.

27 Kunti was the senior wife of King Pandu and mother of the Pandavas. Kunti's widowed status is not important in the *Mahabharata*. The significant aspects of Kunti's life are - first, her power to conceive through invoking the gods, second, the conception of Karna before her marriage to Pandu and the consequent abandonment of Karna which causes her much anguish particularly when the great war takes place, since Karna fights on the side of the Kauravas and against her other sons, and third, Kunti's important role as mother of the Pandavas. For an insightful interpretation of Kunti see Irawati Karve, *Yuganta, The End of an Epoch*. Sangam Books, Delhi, 1974, pp 37-55
28 A 'pativarata', for instance, is defined by Brihaspati as one who is emaciated when her husband is away on a journey and who dies on the death of her husband. Leslie, op cit, pp 293-94
29 Leslie, op cit, pp 293-94
30 According to Tryambaka's *Stridharma paddhati* the brahmana priests should recite the words, "may you be the one who accompanies your husband always when he is alive and even when he is dead". According to the same text, there are great rewards in store for the pious sati: "if when her husband has died a woman ascends with him into the fire she is glorified in heaven, as one whose conduct is equal to that of Arundhati". Leslie, op cit, pp 293-94

42 That the widow is not an ascetic is evident from the observations of Parvatibai Athavale, a widow writing about widowhood in 1928. Describing the forced tonsure of widows Parvatibai distinguished between the voluntary acceptance of the renunciate status and the coerced celibate status of the widow as embodied in her tonsure. The voluntary shaving of the head as an initiatory rite, for those who 'give up' the worldly life, was regarded by Parvatibai to be a "rightful religious act" but not the compulsory shaving of the head of the widow against her volition. Volition therefore was the crucial difference between a true renunciate existence and a simulated renunciate existence of the widow based on coercion exerted by others. In her view the renunciate within the home was a contradiction in terms. Parvatibai Athavale, *Hindu Widow*, Reliance, Delhi, 1986 (reprint), pp 48-49
43 As early as the 2nd century AD, Tamil poems portray the asuterities required to keep the dangerous power possessed by women under control. One poem describes the hazards of a young, chaste high-born woman attempting such control: unable to do so she wanders towards the burning ground -- only there is she freed from the passions of her youth and able to protect her chastity. George Hart 'Woman and the Sacred in Ancient Tamilnadu', *Journal of Asian Studies*, Vol XXXII, No 2, February 1973, pp 233-50, p 242

78 Ibid, p 86
79 Ibid, pp 87-88. The material condition of women as permanent dependents of men is a crucial component of women's vulnerability. This is compounded when a woman is widowed because she is then regarded as losing even her limited entitlement to food and clothing to which she had access as a wife. She also loses the power she may have wielded as manager of the domestic domain. Cultural values legitimise a low allotment of food as widows are expected to fast often and eat minimally. In return for the 'maintenance' they receive from their male official kinsmen (or even natal kinsmen) they must render labour which is invisibilised. Widows are often taunted with the allegation that they are 'dudges', eating up the resources of a household. For an extended discussion of the material dimensions of widowhood, see Uma Chakravarti, 'Social Pariahs', op cit

American Political Science and South Asian Studies

Virtue Unrewarded

Paul R Brass

The study of Indian politics in the US has for long remained an insignificant and stagnant sub-field of American political science. There are academic and ideological reasons for this neglect, but it also stems from the restrictions placed on foreign researchers by the Indian government. In effect, American scholars have become agents of the government of India rather than of the CIA.

THE study of South Asia, primarily of India, by American political scientists has barely held its own as a sub-profession in both the discipline of political science and in South Asian studies over the past 50 years.[1] Though several individual political scientists have made extraordinary contributions in the quantity and quality of their writings, the number of specialists in the field has remained very small. And, though the coverage of subjects – from party/electoral studies to studies of ethnic, linguistic, and communal issues to issues of political economy – has also widened considerably, the field has remained intellectually stagnant, largely unmoved by challenges such as 'subaltern studies' and post-modernist approaches. My purpose in this paper is to argue that these results have been shaped in part by academic – disciplinary and scholarly – pressures and cross-pressures, by ideological constraints, and by restrictions imposed by government upon our work, in this case especially by the government of India. The first part of the article focuses on the academic and ideological issues, the second and longer part on the question of government control over our work.

In contrast to other area studies, notably of East and South-east Asia, the intellectual development of South Asian studies was moved less by cold war considerations than by the interactions between political scientists and their disciplines, on the one hand, and between political scientists trained more or less rigorously in the methods and theories of the discipline and the apparently undisciplined character of their subjects of study, on the other hand. Insofar as the cold war was concerned, there were a few early studies of Indian politics which fit easily into the ideological framework of the time. Specialists in the study of world communism did not ignore India. They included John Kautsky, who found more discipline in Indian politics, in this case the Communist Party of India, than any of us have ever since been able to discover. He documented carefully; if superficially, the extent to which the CPI marched in step with the dictates of the Comintern and later the Cominform.[2] Josef Korbel wrote an otherwise excellent work on the Kashmir issue between India and Pakistan, but sought by Procrustean means to fit it into the cold war framework, to identify local communists and fellow travellers, and to demonstrate that Kashmir was yet another aspect of the international civil war between communism and the 'free world'.[3] A third book, by Overstreet and Windmiller, provided a detailed and still authoritative history of the origins and development of the Communist Party of India, but eschewed any effort at polemics.[4] None of the authors of these works, however, except Marshall Windmiller, were political scientists trained in South Asian area studies programmes.

Scholars of Indian politics could hardly avoid studying the communist and socialist parties, which were the most important non-Congress political parties for several decades up to the 1970s. However, such studies mostly sought to fit these political formations into the landscape of Indian politics in general rather than into the context of the international rivalry between the superpowers. These studies reached a kind of culminating point in the competing compendia on radical politics in South Asia which appeared simultaneously, if fortuitously, in the mid-1970s. While these two volumes also emphasised the domestic aspects, they sought to place radical politics both in their south Asian and their international contexts. One, edited by Gough and Sharma, searched heroically for the revolutionary underpinnings of South Asian politics in hopes of demonstrating that there was a glorious revolutionary future for those countries.[5] The second, by Brass and Franda,[6] gave the 'liberal bourgeois' perspective and argued to the contrary that these hopes were unrealistic, that neither the communist nor socialist wings of the left in South Asia were capable of, or interested in, launching South Asia into such a future. Moreover, the contributors to the latter volume mostly argued that the parties of the radical left in South Asia were more influenced by indigenous than by international pressures. They also argued that international communist strategies were as much or more influenced by South Asian realities than by vice-versa. The fact, however, that such studies were still being done in the mid-1970s by confirmed South Asia specialists does demonstrate the existence of one set of cross-pressures on American political scientists – those coming from our training as such and those coming from persons and institutions interested only in the place of South Asia in the global struggle.

A second set of cross-pressures were those that came from the discipline itself, which were both methodological and, in a sense, were also more focused on the nature of the contemporary world into which South Asian politics might fit than in the relationship between South Asian politics and South Asian history, society, and culture. Respectable political scientists setting out to study India and other developing countries were supposed to demonstrate the theoretical relevance of their studies to the global processes of development and modernisation, mostly within frameworks derived from Talcott Parsons. These frameworks had names such as structural-functionalism and systems theory. There was also a monumental effort sponsored by the Social Science Research Council in the 1960s, out of which emerged seven volumes with a political focus on political parties, communications, education, and other subjects, set in a broad historical and comparative framework. The contributors were all descendants of Parsons in one way or another, though they proclaimed a new framework called 'crisis theory'.[7]

The central figure working on India from this perspective at the time was Myron Weiner. One of his early works was a survey of South Asian politics in the structural-functional mode, which appeared in Almond and Coleman's *Politics of the Developing Areas*.[8] His book on the Indian National Congress, published in the mid-1960s, made use of the SSRC 'crisis theory' framework.[9] Virtually all his books, in fact, were self-conscious attempts to demonstrate the importance of India to prevailing theories of development and modernisation, though his later works drew upon what are called

middle-range rather than grand, global theories of politics, development, and modernisation. However, Weiner, an inveterate empiricist and still the keenest observer of Indian politics I know, carried some of these theories lightly, with the consequence that the case studies he presented overwhelmed the theories. Fortunately, therefore, most of his writings continue to stand as invaluable accounts of politics as they were when he wrote.

Indeed, some of Weiner's work, particularly the book on the Indian National Congress, have become benchmark studies for political science scholars of a more recent generation working on India. Atul Kohli has followed in Weiner's footsteps literally and theoretically, revisiting all five of his case study districts and making use also of a variation of 'crisis theory' in his important and valuable book, *Democracy and Discontent: India's Growing Crisis of Governability*.[10] Kohli too carries his theory lightly. The book is really more an argument about the future of Indian politics and the dangers to Indian stability than an exercise in demonstrating the relevance of India to global theories of development and modernisation.

In fact, it has been rather difficult for trained South Asia specialists in general, and for political scientists in particular, to use such theories or even to take them seriously since the publication of the Rudolphs' *The Modernity of Tradition*,[11] which I have always read – though it has other messages – as having administered a fatal blow to attempts to fit India into global theories derived from the experiences of Europe and America. On the contrary, the Rudolphs set out to show that such theories have to be modified or even transformed in the light of Indian realities.

Now, whether attempting to operate within a given mode as Weiner has done or attempting to overthrow and replace it as the Rudolphs have done, it is clear that three of the most important and prolific writers on modern South Asian politics have been very much oriented towards the relationship between theory and empirical realities, between the pressures and demands of the discipline of political science and what they, as South Asia specialists, see and know. Yet, the results have not been any kind of truly fruitful interaction between the discipline and South Asian area studies. There are several reasons for this state of affairs.

One reason is that the theories themselves, global theories of development and modernisation, have become intellectually discredited – and this much before the post-modernist attack on global theories of all sorts. Few people take them seriously any longer though I would like to note that they lingered on for many years in political science, quite oblivious to the arguments of the Rudolphs. A second reason has been the Americocentric nature of American political science, the dominance of the discipline by American area studies specialists who know nothing or next to nothing about other cultures and world civilisations, and who have gone on decade after decade tirelessly reproducing tiresome studies of the factors influencing electoral turnout, public opinion, and other such trivial matters, fine tuning their methodologies, many of them simply administered to students in their classes rather than to 'real people' in the outside world. A third reason has been the constant lure, a sort of search for the Holy Grail, of a unifying theory, preferably one totally free of the need to examine and certainly not to visit, except touristically, 'research sites' – and especially not research sites in dirty and backward countries or even in the slums and ghettos of the US.

The latest manifestation of this latter search has been the sweep across the profession of rational choice theory. Although there may be a few graduate students in South Asian studies who have flirted with the application of rational choice theories to the subcontinent's politics, most of us continue to believe, I think – perhaps stuck in some sort of 'essentialist' attitudes towards India and Indians – that these theories will not have much predictive value or, perhaps more important, they will not tell us anything important or that is not obvious about Indian political behaviour. I should, however, in fairness hasten to add – for whatever it is worth – that Indian voting behaviour has lately proven susceptible to prediction by standardised questionnaires administered to random samples of the Indian voting age population. I happen to think, however, that this apparent predictability continues to fail to uncover the enormous variability underneath the apparent uniformities in voting behaviour. I also happen to think that such uniformities are themselves products of the process of study in a form of the self-fulfilling prophecy produced by the media and the public opinion pollsters themselves. In other words, India is becoming predictable like the United States because its democracy at one level – a most superficial one – has become manipulable by questionnaires.

The third reason for the failure of communication between South Asian area studies and the discipline of political science is that India has become a home and a source for anti-theory. There is now a whole new generation of both scholars of India and Indian scholars, mostly historians and sociologists, whose intellectual orientation is post-modernist. Here, however, the obstacles to fertile interactions between South Asian area studies specialists in political science and their discipline come as much from South Asianists as from non-South Asianist political scientists. In fact, for the most part, both the groups are among the most benighted upholders of old theories and methodologies in the social sciences today.

The Rudolphs again are an exception here, having fastened – as has this speaker – on to contemporary modes of thought. I have a feeling that in the more open intellectual environment of the University of Chicago, the Rudolphs do not face the dumbstruck comments which I have faced in this regard in various places, not just in my own university. A few examples: "Whenever I hear the word post-modernist – or Foucault – I reach for my revolver." "Who can read this deconstructionist claptrap?" Or, in a more indulgent mode, I am sometimes referred to as a person who did some good work in his "pre-discursive phase". Closer to the truth, however, is Peter van der Veer's comment to me at a recent conference that I have become a cross-dresser, shifting back and forth between post-modernist modes and a Lasswellian approach to politics as "who gets what, when, and how". In either case, for sure, it cannot be said that post-modernism or any other new and vital mode of contemporary intellectual thought has captured political scientists working on South Asian politics. Having said this, nevertheless, I do want to assure my colleagues, especially those who have made the comments just quoted, that I continue to find much of the contemporary work of political scientists of South Asia of great value.

However, my main point, insofar as the intellectual relations between political scientists trained in South Asian studies and their discipline are concerned, is that cross-fertilisation has not worked effectively despite some virtuous attempts by practitioners of South Asian political science to demonstrate the relevance of our studies to the discipline. I have also suggested that the faults lie on both sides. Most important, the cross-pressures on political scientists have fatally clashed, whether it has been the inapplicability of cold war perspectives and geopolitical theories in general to South Asian international and domestic politics, or the poverty theories of politics demonstrate when applied to the region.

II

I come now to another set of cross-pressures, those that have spread their tentacles out directly from the governments of the United States and India, which have also affected our work. There is no denying the fact that there was an inseparable connection from the beginning of South Asian studies in the United States with the expansion – some would say imperial expansion – of United States influence around the globe. However, I also believe that the importance of this connection has

been overstated and misinterpreted. South Asian area studies did not get funded because the United States government wanted to use it as an instrument of American foreign policy. On the contrary, we sought to attach ourselves to the largesse of spending on international projects of all sorts that was going on at the time without in the process becoming compromised by the acceptance of money from tainted sources such as the CIA, the department of defence, or even the state department. While there have been a couple of exceptions to the rule, most of the money provided has come openly and above-board and in relatively small quantities, by the way, from the Office of Education and the Smithsonian Institution. We were forced to accept the designation for our language and area studies fellowships of 'National Defence Fellowships' in order to satisfy Congress that it was really doing something in the interests of the United States rather than in the interests of feathering the empty nests of academic scholarship for its own sake But most of us, virtually all of us, were in fact doing nothing but that and accepted the 'National Defence' designation as a necessary and harmless compromise in the 'real world'.

The reward for our virtue in this respect has been the virtually universal designation of most of us by most academics and bureaucrats in South Asia as CIA agents. It should be noted, however, that such a designation, though it inspires dread among our South Asian colleagues, does not necessarily phase all politicians, government bureaucrats and military men in India, some of whom would prefer to make direct contact with the CIA and would be happy to know we have a direct line to the agency. The myth of the CIA penetration of American academic area studies has become so widespread that it affects the current generation of American students as well. At least half in my classes, at least, assume every time I go off to India for an election study or to attend some conference in India, leaving them behind a week before the end of term, that I am heading off under the orders of the CIA. The other half (keep in mind that I teach in Seattle), hearing my strange Boston speech and my constant criticism of the policies, politics, and politicians of the United States and seeing my beard and dark complexion, think I am Indian. There is also some overlap, I believe, in the minds of the students between these two perceptions.

Our virtues and our lack of rewards for them, however, are most evident not in our relations with our own government but in those with the government of India. Not only have we not been rewarded, but most political scientists and other social scientists and many, if not most historians, and even many scholars in the humanities and natural science disciplines as well, have not been welcomed by the government of India. Before I get to the treatment meted out to us by the government of India, however, let me say a few more things about our virtues. One virtue has already been more or less stated. Whatever our general implication in the expansion of American influence in the world, in cold war ideologies, and in the various discourses which have spun off from both of them, nearly all of us avoided accepting money from government agencies and other institutions which were direct instruments in the prosecution of the cold war, and avoided especially any relations with intelligence gathering agencies. I might add also that some of us actually argued, agitated, and demonstrated against the cold war ideology and its worst manifestations in general and in specific places like Vietnam and elsewhere Indeed, I never thought much of, and in fact deeply resented, the attitudes of people such a Sartre and his followers in other parts of the world, living in societies where 'resistance' has been more myth than fact, who boycotted the United States during the Vietnam war at a time when more than half the population either had already been mobilised against it or had been persuaded that it was an unjust war and one not in the interests of our country

Second, not only have American South Asian scholars not been cold warriors for our government or CIA agents acting to undermine the stability and national unity of India, but many of us have been advocates and spokesmen for India – even when we did not like particular governments. Most political scientists and economists specialising in South Asia argued for economic aid to India and against military aid to Pakistan from the 1950s through the 1970s, for which our reward, of course, was always the question in India, "Why do you support Pakistan against us?" In fact, we at least not only did not support Pakistan, but several of our international relations specialists and others of us as well argued that the United States should pursue an Indo-centric policy in South Asia, and one or two of them worked within the state department itself to try and bring this about. Our support for India's policies was most apparent in the declaration signed by many dozens of South Asia scholars from many disciplines against the Pakistani suppression of the popular movement for an independent Bangladesh, our support for the Indian action to liberate Bangladesh, and our condemnation of the Nixon-Kissinger intervention on the side of Pakistan in the third Indo-Pakistan war.

Now, it is also of course true that most of us were dismayed by the Emergency regime introduced by Indira Gandhi and condemned it. Many of us have also been appalled by the actions of the state police and security forces and of the government of India in Punjab and Kashmir, not to mention Assam, which never gets the same attention granted in the media to the former two places. In the matter of the gross human rights violations by the government of India, however, even here our 'virtues' in relation to that government have been too amply demonstrated. Although many of us, in one way or another, have shown where we stand on these matters, we have not as a group lobbied, agitated, or signed statements of protest against the policies of the government of India, despite the fact that its human rights record has been severely criticised by all the leading, impartial international human rights monitoring agencies.

Third, in general, though most of us have tried to maintain a scholarly stance of objectivity in our writings about India, it is also obvious from them that we have been sympathetic to Indian political and economic goals and aspirations. Although, in our private capacities as citizens of the United States, we sometimes placed ourselves on one side or another on particular economic or political issues, we usually did so within the confines of Indian political debates themselves Most of us objected to the political policies of Indira Gandhi, but so ultimately did most Indians in 1977. Some of us thought Nehru's socialist policies were too gradual, others thought them too radical, others thought them misplaced, but few, if any of us, stepped out of the confines of the prevailing debates that took place on these matters in India itself. Our scholarship faces a more serious challenge to its neutrality with the rise of militant Hindu nationalism in India, but that is a subject which is for the future and not for this paper, which deals with the past 50 years.

Finally, and most important of all, most of us have been associated with, and some of us have been deeply committed to, the idea of South Asian studies in the United States. By our association or commitment, we have truly believed that it is our vocation to teach each new generation of young Americans in our colleges and universities about India in a dispassionate, impartial, but also sympathetic way. We have sought to demolish myths about the South Asian countries, to convey as best we can what we have learned ourselves about their politics and the relationships between politics and South Asian societies, social institutions, and religions. We have struggled along with the rest of our colleagues for funds from our government, argued with the administrations in our institutions to establish and maintain South Asian area studies centres, and established the American Institute of Indian Studies to provide a steady source of fellowships for our graduate students to go to India to learn the languages and to do research so that they can come back and teach what they have learned to new generations of undergraduates. We have done

all this, moreover, against the grain of not only the virtually total ignorance of India in our society, but of the lack of much interest in learning about it. Our students have clear impressions about China and Japan and a good deal of knowledge about them even before they reach college, but most of them know nothing about India when they reach our classes, which many take mostly to fulfil some requirement or because the time in which the class is offered is convenient for them, or for some other equally irrelevant reason.

Now, what has been the response of the government of India to our sympathetic attachment to India, its goals and aspirations? First, American social scientists have been treated primarily as unwanted nuisances who have no legitimate business in India because they are always studying so-called 'controversial' issues. They are also perceived as wanting to go to the wrong places – to 'border' areas or to areas where insurrections are taking place or to 'the interior' in general. I once had a project – which incidentally never got completed for some of the reasons to be taken up below – comparing party systems in Uttar Pradesh, Bihar, Gujarat, and Tamil Nadu. When I visited the office of the Election Commission in New Delhi in 1973 to request electoral statistics on these four states, I was informed by the deputy secretary, who reacted with suspicion towards me, that these were all 'border areas'. On another occasion, in the course of a three-year long pursuit of project approval for one of my students who wanted to do his PhD research on agricultural innovation in north India, I was told by an education department deputy secretary in a hushed but friendly tone that the problem was that the government of India did not want foreigners to visit 'the interior'.

Some years ago, I collected numerous stories of this type from a partly selected, partly random sample of American scholars of India.[12] Many of the stories are darkly humorous, but the consequences have been serious for individual scholars, graduate students, and the profession. They have included and still include, as of this year, denials of project approvals to legitimate scholars who have been granted prestigious academic fellowships to study in India, inordinate delays which have caused terrible disruptions, anxieties, and financial and other losses to them, and a decline in the study of serious contemporary social issues by legitimate social science scholars. Access to India for research on what government of India bureaucrats consider to be 'controversial' subjects is now confined, on the one hand, mostly to an older generation of scholars who are either in the good graces of the government of India, or who manage somehow to prevail against the bureaucrats and get project approvals, or who get to India to do election studies. On the other hand, a new generation of Indian expatriate scholars in America have come up who have their own problems of this type as well, but who are better able because of family and other connections in India to go back and forth in spite of the obstacles.[13]

Second, however, the government of India does want some American scholars to come to India, partly because the scholarship done under certain headings and categories is appreciated by Indians of the class from which the politicians and bureaucrats come, partly because it would be detrimental to Indo-US relations to cut off access to India by all senior scholars and graduate students, and partly because of the apparent belief that it is useful to hold American scholars as hostages to be punished when Indian politicians and bureaucrats resent one or another action taken by the United States perceived to be against India and its interests.

On the first point concerning the appreciation of upper class and upper caste Indians for certain headings and categories of scholarship, it is obvious that there has been little or no political objection to studies of ancient history, Sanskrit and other Indian languages, art, and architecture – though, in the post-Ayodhya era, here also some problems may be in the offing. While the humanists working in these areas are no doubt pursuing their own scholarship on their own terms as they see them, it should be obvious that their easy access to India feeds into a nearly two-centuries long political drive by upper caste elites to establish a 'national culture' for India based on their own values and interpretation of Indian history. The time may yet be coming, however, and perhaps has already arrived, when scholars of Hindu religious and cultural texts may face the obstacles to their research encountered by our best scholars of Sikhism. They may not be placed on a 'hit list', but they may also be denied access to the study of subjects on which the results of their research may conflict with the ideals and goals of Hindu nationalism.

On the second point, it should also be obvious that a government which proclaims itself the 'largest democracy in the world' cannot deny access to all foreign scholars in the manner of the former communist regimes. Also, however much the government of India has resented past American world dominance, the still rather large remains of its influence in the world, and its policies towards Pakistan, all its leaders have wanted to maintain or rather to improve relations between our two countries. Even more important, however, and a point to which I will return, is that most upper class, upper caste families in India consider it their children's birthright to receive their higher education in American colleges or universities, though a large number also seek admission to Canadian and British universities as well. The parents of such families watch the tuition rates go ever higher with even greater concern than the many millions of parents of American families who will never be able to afford such an education for their children.

I have had middle class Indians say to me, "How will we ever get $ 60,000 to pay for the education..." of our son or our daughter, let alone for two or three sons or daughters. But somehow or other, a very large number of such parents succeed in doing so. And let me hasten to add that I am enormously happy to have their children and their children's children who have become American citizens in my classes. But the point here is simply that the parents of these children include many of the senior bureaucrats in the government of India who make the decisions on access to India for American scholars and realise that it would be unwise in such circumstances to close the door completely to American scholarship on India.

On the other hand, since not every upper caste Hindu family in India, and not even every upper caste bureaucratic family in India, can succeed in sending their children to America, an enormous resentment exists in the minds of many at their failure – or the difficulties they have encountered with the visa section of the American Embassy – in obtaining a visa once they have gained admission to an American institution. It matters little to them that if any of our bureaucratic friends asked one of us to do so, we would certainly write a letter to the consular section of the embassy or talk to one of our friends there, or even go and pound on the table on their behalf. It also does not matter to them that there is a gross disproportion in the nature of the issues between the aspirations of the elite of an entire society to gain higher education and, in many cases, a work permit and citizenship in the United States, and the aspirations of a tiny sub-section of the American academic community to come to India for research and to send its graduate students to India for a year of language training and a year of research for their PhD dissertation. It matters not to them also that their government's policies regarding the obtaining by foreigners of citizenship in India are among the most restrictive in the world and those of the United States, with all its defects, one of the most open.

Yet, we are held hostage to the resentments of Indian elites on the score of American immigration policy. Moreover, this is not the first time that we have been held hostage in this way despite the fact that our sympathies are almost overwhelmingly with them on the matter. I have already mentioned the support many of us articulated for Indian policy with regard to the liberation of Bangladesh. What

was our reward for that? – the imposition of a virtual ban on American scholars travelling to India for research that year.

Individuals also have been selected for victimisation in this way. I give as an example the case of Robert Hardgrave, Jr. for whom I can personally testify that he has always been absolutely opposed to any truck directly or indirectly with intelligence agencies. Neither he nor most of the rest of us in South Asian studies feel, however, that the same stigma should be attached to relations with the state department. Therefore, and probably also in part because he thought he might do some good for Indo-American relations, he agreed to write a group of papers on the future of India. He insisted that these papers be published openly and sent a copy of the original papers to the Indian embassy in Washington, DC and, later, a copy of the book which contained them to the ministry of external affairs in New Delhi.[14] Within the manuscript, Hardgrave speculated on the consequences for Indian politics should Indira Gandhi die. The reward for his honesty and openness was the launching of a smear campaign by the *Patriot* newspaper in New Delhi claiming that Hardgrave's manuscript was a secret and numbered document prepared for the CIA! Unfortunately, Indira Gandhi was assassinated three months after this campaign against Hardgrave, and Rajiv Gandhi himself and Congress politicians all over north India used Bob's little book in the heat of the 1984 election campaign as evidence of a CIA conspiracy to assassinate Indira Gandhi, which they knew to be totally false. Since I was myself moving about north India at the time, studying the election and hearing these speeches being made, and since Bob's name was not specifically mentioned, I began to run a little scared myself because I thought they might be talking about me for some reason and it was a couple of weeks before I discovered that the prime minister and the Congress were not in hot pursuit of me. Bob was allowed to come to India some time thereafter, but I am told he was accompanied everywhere he went by two security agents who watched his every movement as well as every person he went to see.

Now, there is nothing unusual about smearing and misrepresentation in electoral campaigns. We know well enough from the experience of our own country that the great majority of even otherwise decent politicians turn into swine during election campaigns, and we are seeing even during this current campaign a repetition of Bush's discreditable Willie Horton ads being used in New York and other places. Still, one must ask some questions about the importance attached in India to our writings and actions. Should the government of India not pay more attention to Hardgrave's textbook,[15] which still to my great regret continues to outsell mine[16] as the principal text on Indian politics in North American universities? Should it not be pleased to see the impartial and sympathetic approach taken to Indian politics and its leaders therein? Should it not want to see such an objective picture of Indian political institutions and behaviour presented as the first, basic source for most Americans who receive any education on that subject? Should its leaders not, therefore, recognise its friends, as well as good scholarship, rather than use us as political footballs in their electoral campaigns?

If you believe, as I do, that the answers to these questions are all "yes", then how on earth do we explain the behaviour of Indian politicians and bureaucrats towards us? The answer is passing strange and must be presented in several parts. The first part is the belief among India's leaders that they are spokesmen for a great and important country in the world. Second is the belief that, though their country is great and important, they and India are not respected as such by the United States. Third, however, the perceptions outside India if not the realities are exactly the opposite, namely, India is perceived as a great and important country. It is also neither respected nor not respected. The truth rather, which I have found no Indians who have not lived in the United States to be aware of, is that hardly anybody – except us, of course – has ever cared about India or thought about India. Further, we have all of us who read both Indian and American newspapers been struck by the fact that issues and irritations hardly anyone in America has ever heard about, from cyrogenic rockets to Super 301 to the Dunkel draft, and even for that matter to casual comments by State Department representatives about Kashmir, appear on the front pages of Indian newspapers, and that we are expected to answer aggressive questions put to us about why the United States government is again picking on India. Those of us who were in India this year also were embarrassed to have to point out that the visit of India's prime minister to the United States was one of the major non-events of the year in our country.

Now, how does this relate to the treatment American social science scholars have received in India? The fourth part comes here, namely, that the government of India has no weapons worth talking about to use against the United States, so they use us as hostages. However, since our own government hardly cares about us either, we provide the best test of the argument that, if the press does not publicise the taking of hostages and their plight is ignored, hostage-taking will not be undertaken in future because it will be shown to be unprofitable. But we are peculiar sorts of hostages. Those of us who are taken are confined to our own country and not allowed to come to India to do our research. However, since no fuss is made about us in the newspapers of either country and no one comes to our defence, most of us will ultimately be released from our confinement to come to India for research provided we agree to study panchayati raj in ancient India or some other suitable topic.

This brings me at last to the quite serious and damaging consequences of all this. The consequences of the use of American scholars by the government of India in these ways, not through an explicitly stated policy or set of policies but through a multiplicity of little and big actions in relation to us over the years, has been a subtle and damaging control over our academic studies and our professional lives in ways which we would certainly condemn as unacceptable, undemocratic, and even 'fascistic' were they applied to us by our own government. Yet, we have gone on accepting these controls and restraints partly out of fear and cowardice, partly out of a liberal breast-beating belief that we have no 'right' to access to India, that 'right' is on the side of the government of India against the American imperial state. In this respect also, we have fallen for an argument that liberal Americans would reject in all other circumstances, namely, that it is the state that determines 'right'.

We, American scholars, have become, in effect, agents of the government of India rather than of the CIA. Because of the restrictions placed upon us, which amount to an intolerable form of control over our academic work, we, that is scholars of India in general, do research that supports the image that the government of India wishes to present to the world, whether of its ancient culture or of its present goals and aspirations. And we are prevented from doing the research we want to do which the government of India feels will not serve its purposes. The only word for this is pre-censorship. Some of us manage to escape it one way or another, but we as a scholarly community, including our fellowship-granting agencies, have become implicated in this process. We interpret and publicise the information to fellowship applicants that the government of India is unlikely to approve certain topics, and most of us discourage our students from proposing such topics. We allow our projects to be vetted by government bureaucrats, not just for legitimate security concerns, but on broadly political and personal grounds as well. Instead of encouraging our students to pursue whatever research projects they consider most engaging or relevant to the theories prevailing in the discipline, we are supposed to steer them towards non-controversial projects which we hope will be acceptable to these same bureaucrats. I should add here that this kind of guidance often fails because we find that some people end up gaining project approval for work in Kashmir while one of our students with

a project on some harmless topic gets denied entry or suffers inordinate delay anyway.

The most damaging aspect of all this from the point of view of the future of South Asian studies is that it has caused the redirection of the careers of some promising young scholars, and discouraged many other young men and women in political science and other social science departments from seeking careers in our field. Associated with this, naturally, has been a decline in the contribution of the social sciences to South Asian area studies in general, something pointed out in a report by Kenneth Jones about 20 years ago.[17] Major South Asian areas studies programmes in the United States now lack coherent social science components. Some of them are reverting primarily to the Orientalist traditions of scholarship, emphasising Sanskrit and other classical languages, the study of Indian philosophy and religion, and textual analyses of all sorts, and are defending with less and less enthusiasm the goal of sustaining and developing interdisciplinary area studies programmes.

I had planned also to make some comments here on an extremely troublesome aspect of this whole matter, namely, the silence of our professional colleagues in India about these matters. As far as I know, one or two of our colleagues in India have occasionally drawn attention in some closed meetings to our problems, but I am not aware that there has been any significant public criticism of government of India policies towards our research in India. On the contrary, some years ago it was believed that many of the project approval problems we were then having were a consequence of the hostility of some Indian academics to our research in India. I believe that problem is no longer as serious as it was. However, when I have mentioned our problems to some of my closest academic colleagues, even those who would certainly never have been hostile to us, there has been either no response or a statement that they were not aware that we had such problems. I do not want to say anything more on this subject now except to say that the attention of our colleagues in the social sciences and history in India to our problems would be most welcome.[18]

I come finally to the question: why do we accept all this? There are several answers, already referred to above, but there are two which I want again to mention, which I consider especially discreditable or wrong-headed. One is that the majority of our scholars still get into India one way or another, especially those in the humanities. Those who get in, and the agencies which provide the fellowships for them, would rather not complain or 'rock the boat'. So, there is no solidarity amongst us. Second, as I have already mentioned, we think it is the 'right' of the government of India to do what it likes in these matters and we have no 'right' to complain about it. I have already indicated that I consider this a form of liberal muddle-headedness which is not at all truly liberal because it accepts the language of the state as defining our 'rights'. It also reflects a kind of paternalistic attitude towards India, a subject on which I would also have more to say were there sufficient time, that suggests that India has somehow been a victim of imperialist America and we have to acknowledge that we are agents of that imperialism whether we like it or not and must do everything in our power to make up for the actions of our government. My argument, on the contrary, is that this is backwards and that, if we are agents of any government, it is of the government of India.

Notes

[This article is a slightly revised version of a paper prepared for the panel on Themes and Trends in South Asian Studies: The Last Fifty Years, for the 23rd Annual Conference on South Asia, University of Wisconsin-Madison, November 5, 1994. I am grateful to the other participants on the panel and to members of the audience at Madison as well as the following persons who made critical comments on the first draft: Barbara D Miller, Daniel Neumann, Sumit Ganguly, Granville Austin, and Stephen Cohen. None of the named persons, however, share any responsibility for either the factual accuracy or the opinions expressed herein.]

1 One criticism of this paper made at the Wisconsin conference was that it neglected to mention the role of Indian scholars in the study of Indian politics. However, this is not relevant to my theme here, which focuses on the development of the field of political studies of South Asia in the United States by American scholars. There are some relevant points to be made about the early relationship between American and Indian political scientists, which do deserve further comment, on such matters as the initial mimicking by Indian political scientists of American methodologies and theories, their own incorporation into and then partial separation from 'American' political science, and their relationship to American universities and American funding agencies. Nevertheless, I have chosen, rightly or wrongly, not to step into that somewhat larger subject in this brief article, though I include within its scope by implication and specific notice the work and problems of scholars of Indian origin who live and teach in the United States. I should also say that my references in the text to the work of American scholars, including those of Indian origin, are not meant to be comprehensive but only illustrative of the issues I have raised.

17 This was an in-house report done under the auspices of the American Institute of Indian Studies.

18 However, Stephen Cohen has reminded me in a personal communication that Indian scholars have their own problems with their own government and that Pakistani scholars have had even more serious problems in this regard. Has not the time come for us all, scholars in the United States and South Asia, humanists and social scientists to stand together against all our governments against any restrictions whatsoever on free access of scholars and writers for research, on an equal basis irrespective of citizenship, to materials, persons, places, and sources on any subject or topic for which access is not restricted for evident security reasons? Should we not also stand for the principle that any places accessible and sources available to citizens should be available also to non-citizens?

Economics of Population and Development

Manashi Ray

India is the second most populous country in the world with 934 million people and according to estimates, it will grow to 1.4 billion by 2030. However population growth is not simply a problem of numbers; it is a problem of human welfare and development. This paper contends that population growth is not the only, or even the primary, source of low levels of living, eroding self-esteem and limited freedom in the less developed nations. Contrary to customary assumptions, population growth in conjunction with other determinants of development has on many instances promoted social change, and in the recent past has been a boon to economic growth in the newly industrialised countries. It is therefore an issue of management and optimum utilisation of present and future human resources.

THE global population will increase during the next 35 years to around 8.5 billion with almost 90 per cent of the increase occurring in developing countries, additionally, about 70 per cent of the increase will occur in poor countries where the average person's income is less than two dollars a day. India, the second most populous country in the world with 934 million people will grow to 1.4 billion by 2030, and China with its 1.2 billion people will continue to remain the population giant in 2030 with 1.5 billion [World Bank 1994].

These increases are unprecedented in the history of mankind (Figure 1), but this phenomenal growth of population is not simply a problem of numbers. It is a problem of human welfare and development. However, the alarmist exhortation against the tidal wave of population increase makes little sense if attempts are not made towards a comprehensive understanding that would integrate demographic and economic as well as other developmental assumptions.

If development entails improvement in people's level of living – their income, education, health and their general well-being – and if it also includes their self-esteem, respect, dignity and freedom to choose, then the important question about population increase is: How does the present population situation in many developing countries contribute to or detract from their chances of realising the goals of development, not only for the current generation but also for future generations? Conversely, how does 'development' affect population growth?. Consequently, the major issues relating to this basic question are:

(i) What are the implications of higher population growth rates among the world's poor for their chances of overcoming the human misery of absolute poverty? Will world food supply and its distribution be sufficient to meet the needs of the anticipated population increase in the coming decades?

(ii) How will the developing countries cope with the vast increases in their labour forces over the coming decades? Will employment opportunities be plentiful, or will it be a major achievement just to prevent unemployment levels from rising?

(iii) To what extent are the low levels of living an important factor in limiting the freedom of parents to choose a desired family size? Is there a relationship between poverty and family size?

(iv) Will the developing countries be capable of improving the levels of living for their people with the current and anticipated level of population growth? To what extent does rapid population increase make it more difficult/easier to provide essential social services including housing, transport, sanitation and security?

(v) To what extent is the growing affluence and the desire to grow further among the economically more developed nations an important factor preventing poor nations from accommodating their growing population? Is the relentless pursuit of increasing affluence among the rich an even more detrimental force to rising living standards among the poor than the absolute increase in their numbers [Todaro 1989]?

With reference to the above questions, it becomes essential to analyse the population issue not simply in terms of numbers, or movement of people, or rates or densities, but as social trends which if favourable and well-managed open a man's options and enlarge his choices.

In the subsequent part of the paper I contend that population growth is not the only, or even the primary, source of low levels of living, eroding self-esteem and limited freedom in the less developed nations. At best, rapid population growth in many countries and regions may appear to be a serious intensifier or multiplier of integral components of underdevelopment. The position espoused in the essay essentially opposes the view expressed in 1968 by Robert McNamara who, on becoming president of the World Bank, called population growth the "greatest single obstacle to economic and social advancement in most of the societies of the developing world". This extreme version of population as a serious problem attempts to attribute almost all of the world's economic and social evils to excessive population growth. It is claimed to be the principal cause of poverty, low levels of living, malnutrition and ill-health, environmental degradation, and a wide variety of other social problems. Incendiary and value-laden words such as the 'population bomb' or 'population explosion' are often used, and dire predictions of food shortages and ecological disaster are attributed almost entirely to the growth in world numbers.

The essay is structured on three general lines of argument which endeavour to establish the idea that rapid population growth in itself is not a serious development problem as often mistakenly perceived by planners and policy analysts

The Real Problem

(a) *Problem of low levels of development is not population* per se *but other determinants of social change:*

The main thrust of this premise is, if strategies that lead to improved standard of living are promoted and pursued, population will cease to appear as detrimental. Thus, underdevelopment is the real problem and 'development' should be the goal.

Consequently, to achieve higher levels of living it is important to raise the overall levels of economic growth – not only for private consumption but also for improved public services.

The links between population and economic growth, especially food productivity has for long been the subject of intense controversy, but writers such as Julian Simon and Ester Boserup have asserted that population growth is beneficial, or even essential, to long-term economic growth. To illustrate this line of thinking , in Europe before 1800,[1] the living standards of the majority usually fell in periods of population growth, but on the other hand large-scale population declines were also observed during periods of improved living standards. This phenomenon suggests that the productive limits of cultivable land had largely been reached; that population growth could be combined with improved living standards only if technology - to produce more food, housing, goods and services from the same amount of land - advanced; and that technology did not, as a rule, move fast enough to keep pace.

The United Nations Food and Agriculture Organisation (1985), had observed that between 1974 and 1983 per capita food

production in developing countries increased almost twice as rapidly as in developed countries. This occurrence refuted the earlier unduly pessimistic position taken by the UN when it questioned the ability of the less developed countries to produce sufficient food to keep pace with population growth

Besides affecting the availability of land and the amount of labour expended on it, population size and growth also influence its productivity Although the expansion of agricultural land in the developing countries has been a significant factor in the growth of agricultural output, higher yield of crop output was the predominant factor. In this regard, Boserup's study (1965) indicated that population growth and the pressure it exerts are important stimuli for increasing agricultural yields. Further, a more recent study by Boserup (1981) as stated by Horlacher and Mackellar (1988), points out that population increase, which expands food requirements, also tends to produce increased food supplies by bringing about a shift towards more intensive land use. The 'green revolution' in Pakistan and in the north-western India are remarkable examples of this striking increase in agricultural output to meet the challenge of a rapidly growing population (Figure 2) by way of introduction of improved high-yielding variety of seeds and superior methods of land use.

Pakistan's 'green revolution' contributed to other aspects of economic development as well. First, the new technology not only produced a much higher output per man, but it also led to an increase in employment in the agricultural sector The increase in employment took place because more land could be cultivated and high-yielding seeds required more labour in preparing the seed beds, applying fertilisers and pesticides, weeding, harvesting and threshing. More labour was also needed because new techniques permitted multiple cropping as has been observed in the Indian state of Uttar Pradesh [Elkan 1973 and Agarwal 1985:91].

Mellor and Johnston (1984) have projected that the rate of growth of food production will continue to exceed the rate of population growth. This belief was largely based on the assumption that in many developing countries the infrastructural and other necessary requirements for accelerated agricultural growth are now in place, while population growth rate is likely to decline in future However, in many developing countries the task of meeting the nutritional requirements of a growing population will require an increase in the population supporting capacity of their agricultural land With regard to this, Wilkinson (1973) argues: "Development is primarily the result of attempts to increase the output from the environment rather than produce a given output more efficiently" Therefore population size – the quantitative dimension of biological man – and its impact decide the amount of labour which is available and the quantity of food and other materials needed; it can almost be regarded as the most important determinant of the scale of cultural operations which relates man to the production systems.

Additionally, apart from having a quantitative impact on the agricultural social system, the size of the population also has a qualitative impact. The limitation on the supply of resources can mean that quantitative change necessitates qualitative change. The 'carrying capacity' is a function of the kind of productive technology which is used. Subsequently, to increase the carrying/supporting capacity of any territory a new adaptive strategy based on new technology will need to be introduced, as has been noted in the 'green revolution' in India and Pakistan. Thus, on the whole it can be stated that much of the historical development of agricultural techniques the world over can be interpreted as a series of attempts to increase the carrying capacity of available land area in response to population growth [Wilkinson 1973]

Desirable Phenomenon

(b) *For many developing countries and regions population growth has been and is a desirable phenomenon:*

Recent economic-demographic simulation models tend to emphasise the role of population growth as an incentive for capital formation as compared to earlier models which laid stress on the negative impact of population growth on the capital-labour ratio. Nowadays, it is believed that by making labour more plentiful, population growth can raise the return on capital relative to the return on the real wage rate, thus encouraging capital formation. The increased rate of return on capital resulting from population growth might also be expected to encourage direct foreign investment. This becomes obvious from the table showing the seven Asian countries presently enjoying the world's highest economic growth rates.

Studying the total fertility rate (TFR) of these countries 25-30 years ago, which was relatively quite high, and the simultaneous decline in the infant mortality rate (IMR) in these years, there must have been a substantial population increase in the young population of these countries, now resulting in some 70 per cent of the seven's population being under 30 years. Moreover, as the TFR has declined in the last 30 years, the child dependency ratio[2] has also decreased, leaving a large section of the population in the labour force who are highly productive as well as voracious consumers, leading to capital formation and setting the economy towards a boom The fact that population growth rates change slowly and their effect on economic growth may take many years to become apparent, is also revealed in the table The relationship between population growth and per capita income growth involves both current and lagged components.

Table: Demographic Details and Economic Performance of Seven Asian Countries

	Countries	H K	IND	MAL	S K	SIN	TAI	THA	INDIA
PGR	25-30 yrs	2 6	2 2	2 9	2 5	2 4	-	3 1	2 3

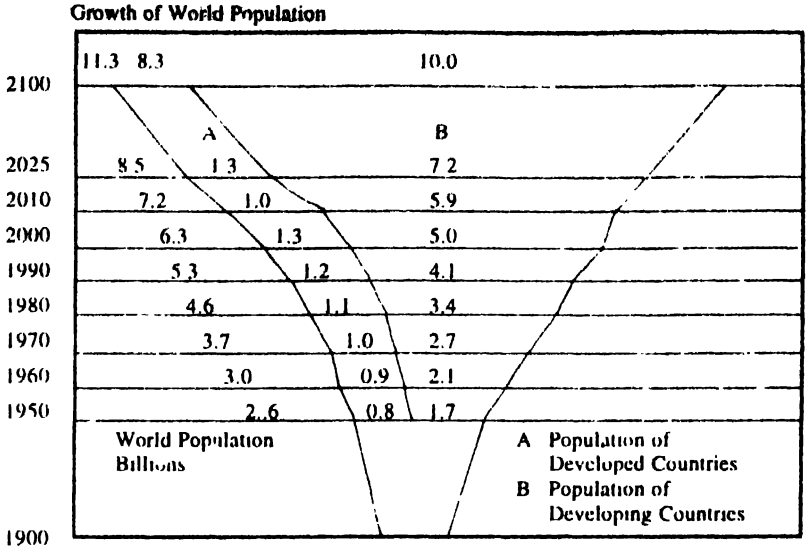
The past population growth is reflected in an increase in the current labour force, whereas comparatively a smaller rate of current population growth, consisting primarily of additional children, will add to the denominator of per capita income.

Furthermore, there is usually a concern that the capital stock will not expand rapidly enough to absorb into the modern sector the increase in the labour force resulting from rapid population growth. In most developing countries, however, those who do not find employment in the modern sector will find work in the other sectors rather than join the ranks of the unemployed. The informal sector promotes skills that are a prerequisite for advancing into modern sector employment, apart from being productive [Sinclair 1978, Horlacher and Mackellar 1988].



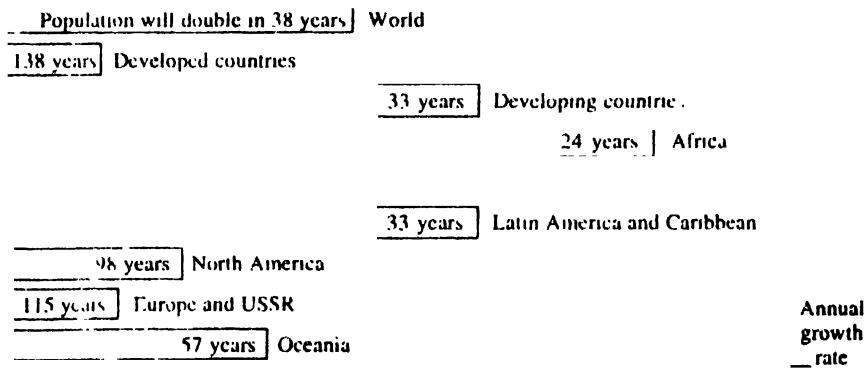
The price mechanisms by which population growth affects economic development are highly complex. However, it can be reasoned that one of the routes is through their effects on savings and investment. In poor countries, having additional children is a form of saving in itself: parents forego present income in order to provide for their old age just as people in developed countries put money aside for pensions. But as the need for extra children declines as an old age security, funds that were to be spent on children now become available as savings for other type of investment, thus setting the ground for economic growth. This is another illustration of population and income growth which involves both current and lagged components. It can also be speculated that countries with a large young population such as India and other developing nations, a shift from a high- to a low-childbearing pattern is usually one in which there are more young households saving for retirement relative to the number of elderly households drawing down accumulated assets [Mason 1988].

Interestingly, a study by the National Academy of Sciences in 1986 pointed out that some investments in land improvement may require a certain minimum population density before they can become profitable. The same has been argued by some third world neo-Marxist pro-natalists, that many rural regions in developing countries are in reality underpopulated, in the sense that much unused but arable land could yield large increases in agricultural output if only more people were available to cultivate it. Many regions of tropical Africa and Latin America and even parts of Asia are said to be in this situation. With respect to Africa, for example, some observers have noted that many regions had larger populations in the remote past than what exists today. Rural depopulation resulted not only from the slave trade but also from compulsory military service, confinement to reservations and the forced labour policies of former colonial governments. For example, in the 16th century the Congo kingdom is said to have had a population of approximately two million. But by the time of the colonial conquest, which followed 300 years of slave trade, the population of the region had fallen to less than one-third of that figure. Today's Zaire has barely caught up to the 16th century figure. Other regions of western and eastern Africa provide similar examples [Todaro 1989]. Comparably, Pingali and Binswanger (1987) attribute the failure of some large-scale irrigation schemes in sub-Saharan Africa to the sparseness of the population and a corresponding lack of demand.

With reference to Clark, Simon and Eberstadt [Todaro 1989, chapter 6], a conventional argument is that population growth is an essential ingredient to stimulate economic development. Larger populations provide the needed consumer demand to generate favourable economies of scale in production, to lower production costs, and to provide a sufficient and low cost labour supply to achieve higher output levels and larger markets, which should permit greater specialisation and division of labour, reduced cost per head of public goods of various kinds and reduced costs per head of transportation, communication networks, and other forms of social structure.

Although the possibilities of beneficial effects of population growth through

FIGURE 1: WORLD POPULATION GROWTH BY REGIONS



Figures are based on the latest projections. These are rather higher than those projected until recently, due to slowing down in the decline of fertility rates in a number of countries.

economies of scale is generally acknowledged, there is less agreement as to where these economies are likely to be found. For instance, in the US, rising population densities stimulated the development of the transport system during the 19th century. An improved transport system in turn greatly facilitated the growth of agriculture by lowering transport costs and by raising the farm-gate prices of agricultural products, whereas the potential benefits to be gained from higher population densities was not realised in rural Bangladesh. transport, marketing and storage facilities, as well as extension services, were all inadequate [World Bank 1984]. In this context, the National Academy (1986:52) asserts that "manufacturing economies of scale exist principally at the urban level and are exhausted at a moderate level of city size", while "economies of scale are likely to occur in agriculture, especially by spreading the fixed cost of infrastructure and research over a large number of people".

Insofar as population growth increases demand, it can contribute to the realisation of economies of scale. This argument is found to be true in the case of the British Virgin Islands. In these islands from 1980-91, the population grew at an annual rate of about 4 per cent and if the growth rate is allowed to continue unchecked, the population would double every 17.3 years. This increase in population affected the economy positively as there was a considerable increase in working age group primarily due to in-migration, due to which remarkable economic progress has been realised. GNP - at factor cost in constant prices - has grown from 77.07 (US $ million) in 1984 to 112.44 (US $ million) in 1989, an increase of about 9.2 per cent per annum, and per capita income has increased from about 5,800 (US $) in 1984 to about 7,130 (US $) in 1989, an increase of about 4.6 per cent per annum [British Virgin Islands, Statistical Abstract No 3, 1990]. Hence, it can be inferred that population growth in conjunction with other socio-economic determinants provided the necessary stimulus for favourable economies of scale to occur in these islands.

Therefore, it makes sense when population 'revisionist', neoclassical economists of the 1980s such as Julian Simon and Nicholas Eberstadt argue, for instance, that a free market will always adjust to any exigency created by population. For example, scarcities will drive up prices and signal the need for new cost-saving production technologies. Thus, free market and human ingenuity will solve any and all problems arising from population growth. This revisionist perspective is clearly in contrast with the traditional 'orthodox' argument of the 1950s to 1970s that rapid population growth had serious economic consequences and if left unchecked would slow down economic development.

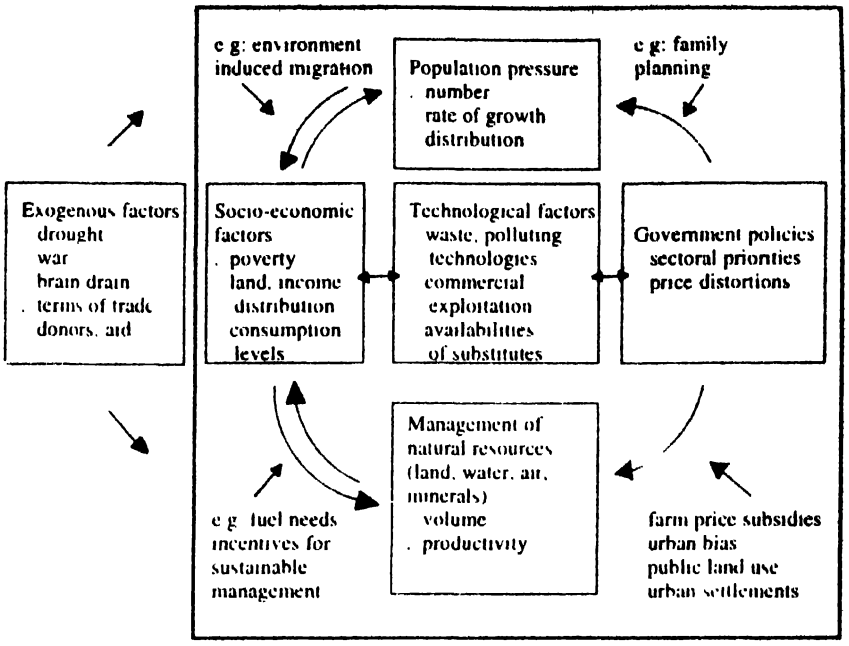
Population and Natural Resources

(c) *Myth of population pressure and depletion of natural resources*

The environmental dimension to population is firmly grounded in economics, among other factors. Behind the demographic issues of population growth and its uneven distribution, fertility levels, age dependency ratios, migration patterns and urbanisation, lies the pressing concern of economic advancement and sustainable development. Therefore, the search for sustainability necessitates that the population issue be addressed within the context of natural resource management (Figure 3).

The concept of 'carrying capacity' has often been used as an effort to build a bridge between the environment and population issues. To quote Kingsley Davis (1991): "The general idea is that by analysis of soil and other elements of the environment, one can estimate how many people can be supported on a given amount of land". Also, a definition by T N Srinivasan, "the maximum population that can be sustained indefinitely into the future", cited by Davis, provides a good basis for contesting this point.

First, why should the definition be pre-occupied only with the 'maximum' population? Why not consider the 'minimum' population as well? For instance, in the counties of western Texas, US, there are not enough people to man the existing infrastructure. The same individual may therefore have to occupy more than one post. Yet few would venture to say that this population is too small to be 'sustained'. An animal species runs the danger of suffering extinction if its number falls below a critical level, but hardly anyone would reckon today that this could possibly be true of human species as well in certain circumstances. As a matter of fact, population in itself is rarely the problem. Its scarcity or density in a



region in relation to resources make people adjust their institutions and behaviour to the situation as elucidated subsequently in two unlike conditions.

The immediate effect of the increased resource demand resulting from population growth would be higher resource prices. In these circumstances, it would encourage the exploration of ecologically friendly sources of energy and stimulate research on alternative technology. There is evidence that the development of renewable resources, such as commercial forests, had responded to price signals in a similar situation. Further, increasing natural resource prices and improving technology might lead to adaptation in institutional arrangements, for example, the conversion of common property resources to private property resources thereby promoting conservation and improved management [Horlacher and Mackellar 1988] With the help of this argument can be defended the remarkable success of village forest protection committees (FPCs) in West Bengal, India. In 1972, the forest department recognised its failures in reviving degraded sal forests in the south western districts of the state The traditional methods of surveillance and policing had led to a complete alienation of the people from the administration The department changed its strategy, making a beginning in the Arabari forest range of Medinipur district Here, the villagers were involved in the protection of 1,272 ha of badly degraded sal forests In return for their help in protection, they were employed in both silvicultural and harvesting operations, given 25 per cent of the final harvest and allowed fuel, food and fodder collection on payment of a nominal fee. With the active participation of the villagers, the sal forests showed a remarkable recovery, and in barely 10 years, a previously valueless patch was estimated to be worth Rs 12.5 crore [Gadgil and Guha 1992 26-29].

Additionally, consumers would be persuaded to adjust to less resource-intensive goods as natural resource prices increase and producers adopt less resource-intensive methods of production Therefore, there are reasons to believe that population pressure on scarce natural resources, usually resulting from population density and growth, can be an important decisive factor associated with natural resource development and management of an area. Unlike the above example, Australians and Canadians do not find their sparse populations to be an obstacle to maintaining a high level of living. Thus, the presence or absence of poulation is not the obvious problem.

Second, the 'carrying capacity' supposedly refers to the commodities wholly or partially necessary for the individuals to live, but from the context in which it is usually referred to one concludes that the commodity really being considered is food. For the very same

FIGURE 3: LINKAGES BETWEEN DEMOGRAPHIC AND NATURAL RESOURCE ISSUES

Source Population Resources and the Environment, United Nations Population Fund, 1991

logic, Davis (1991) has called the usual 'carrying capacity' reasoning the 'the bread alone fallacy' The writers on population issues concentrate on food not only because it is necessary for existence, but it is intimately, continuously, and appetitively involved with the individual organism. It is therefore viewed as a proxy for population itself. Thus, to analyse why a given region is populous, an observer may simply point out that the soil there is singularly fertile. Consequently, the special role of food in an individual's life makes it easy, in reasoning about population and resources, to confuse a necessary cause (food) with a sufficient one.

The in-built food bias in 'carrying capacity' leads to other distortions as well, for example, in unwarranted and largely unconscious assumptions regarding the nature of demographic changes. The biggest error of this kind is the tendency to automatically consider mortality as the chief mechanism by which human numbers are adjusted to resources. As an illustration, if the discussion concerns contemporary sub-Saharan Africa, the usual reasoning takes the following sequence: If the production of food in central Africa continues to fall, the result will be more famines, which will drive up the death rate and thus slow down the rate of population increase. Little account is taken of population being regulated by other important factors such as migration or fertility.

The fixation on food — the assumption that self-sufficiency in food production is desirable — gives rise to another misinterpretation. Contrast this trend of thinking with actuality, where for good reason international trade in foodstuffs has been increasing Since people must eat every day and since most foodstuffs are perishable or seasonal, international trade in food may have more advantage than it does in many other commodities. As a result, if a country has certain advantages in non-food trade, it can use these to buy food. Therefore, a policy of self-sufficiency in food makes no sense for countries like Taiwan, Japan, the US or any other country that has access to international trade The earth is to be perceived as one large trading system and so the 'carrying capacity' must refer not just to food that could be grown within the national borders, but to the total of what could be gained in all ways [Davis 1991].

Further, many times the idea of 'carrying capacity' is treated as a norm or optimum that should be sought. For instance, to admit that the world can support 33 billion[1] people and not more is to imply that below that figure there would be enough to eat for everyone, but above the mark of 33 billion people would starve. Clearly, the underlying assumption is, as the increase in population reaches a high level, it automatically will stop it self – primarily through diseases caused mainly by malnutrition. Hence, according to this idea, people are perceived as automations passively waiting to be killed by their own reproductive success. Overlooked is the possibility that the increase in human numbers may be stopped by people

themselves at a point far below the theoretical 'carrying capacity' not essentially because of a scarcity of food and other requirements, but for the love of the frills and foibles of advanced civilisation and a distaste for the arduous tasks of bearing and rearing children.

Conclusion

It can be asserted that although in the 1980s income in countries whose population had grown more slowly in the 1965-80 period grew 1.8 per cent faster than in countries with faster 1965-80 population growth – unlike most studies of developing countries in which no connection could be found between the growth rates of population and of per capita incomes up to around 1975 – the statistical link is probably an expression of several factors [United Nations Population Fund 1992].

Though the strength of the population factor can be judged by comparing it with the most obvious alternative explanation for the slow income growth in the 1980s, the high debt levels, no correlation could be found at all in the 82 countries between the debt levels in 1980 and the growth in incomes over the 1980s [UNPF 1992] Consequently the explanation to the statistical link has to be explored in other determinants One is the way in which rapid population growth commandeers a large share of investment merely to maintain the same amount of capital per person, leaving little left over to improve capital per person. However, more widely the link almost certainly expresses the impact of other factors that contribute both to slower population growth and faster economic growth, especially higher levels of education and health in the workforce, and increased access of women to the labour market.

To conclude, for any particular level of population growth there is always a big gap between the best and worst economic performance Good economic and trade policies can combat adverse circumstances, whereas bad ones can fail even in favourable situations Even if the recent figures on economic and population growth do suggest, at the very least, that rapid population growth since 1965 may have created problems for economic development in the more difficult climate of the 1980s, good management can diminish the population effect to a considerable extent and has the potential of transforming this impediment to growth into a boon Conversely, a review of studies in this field affirms, where management was poor, rapid population growth has magnified other difficulties. Thus, the question to be addressed seriously is that of good or poor management of population and not of population *per se*.

Notes

1 The famous English monk Thomas Malthus states (1) population is necessarily limited by the means of subsistence, and (2) population invariably increases where the means of subsistence increase, unless prevented by some very powerful and obvious checks

2 One frequently used index summarising an age distribution is known as the dependency ratio Strictly, this is the ratio of economically active to economically inactive persons in the population, but often, because of lack of data or difficulties in defining economic activity in many countries, a ratio of age group is used instead Then the ratio is

$$\text{Dependency Ratio} = \frac{\text{Children+ Elderly}}{\text{Working Ages}} \times 100$$

Therefore, ratios using only children, or only the elderly in the numerator, are also sometimes calculated Accordingly, it is referred to as 'child dependency ratio' or 'old age dependency ratio'

3 The estimated 33 billion human beings under stipulated conditions was the result of a major study of this type by FAO, UNFPA and IIASA The following quotations describe the procedure adopted: The study "combines a climate map, with soil map and then divides the study area into grids of 100 sq kms each the 15 most widely grown food crops were considered Three alternative levels of farm technology were postulated " Given these estimates of potential production along with the calorie and protein requirements of the human body as recommended by FAO and WHO the investigators computed the maximum population which can be supported" [Srinivasan 1988 14-15, cited in Davis 1992]

The findings were as follows

Farm Technology	Billions of People: Carrying Capacity	Billions of People: Projected in 2000
Low	5.6	3.6
Intermediate	14.9	3.6
High	33.2	3.6

Liberalisation, Innovation and Exports

Rajat Acharyya

One peculiar aspect of India's technological development is that whatever little innovation has taken place has been 'minor' innovation, including adaptation of process to indigenous raw materials, instead of major innovations at the frontiers of technology. Can the present liberalisation efforts through successive reduction of tariff rates reverse the trend? If so, how much tariff cut is needed? These issues are examined in this paper.

I
Introduction

THE infant industry argument that an industry with inferior or primitive technology may acquire the technical know-how over time through research and development (R and D) and learning-by-doing while operating behind the tariff-wall in the initial phases provoked many LDCs to adhere to an inward-looking protectionist regime during their initial stages of development. Critics have pointed out that on the contrary, such an 'infant industry' will never come out of its infancy thereby belying the dynamic gains to be had from such protection. A debate has thus emerged over export promotion (or outward orientation) and import substitution (or inward-looking strategy) as the appropriate development strategy for the LDCs.

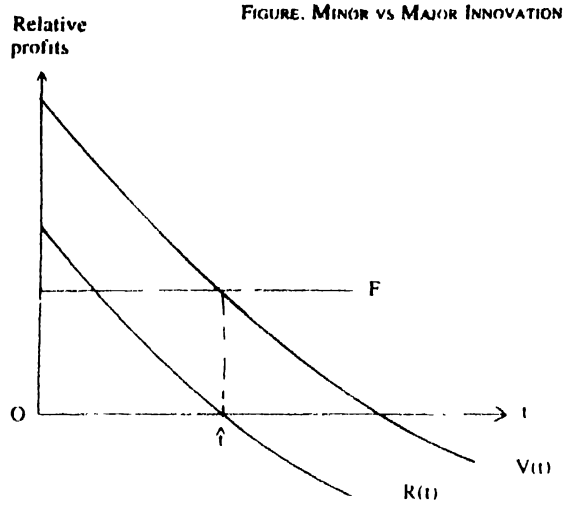
Country experiences are however, not alike. There are the instances of South Korea and Taiwan who have performed better by adopting export promotion strategies than the inward-looking countries [Balassa 1978, 1989]. The statistical and empirical works on the relationship between exports and growth also provide some support for the export promotion hypothesis [Feder 1983; Michaely, Papageorgiou and Choksi 1991, Tyler 1981].[1] But on the other side of the coin, export growth had declined after liberalisation for Colombia, Pakistan, Sri Lanka and Yugoslavia. There are also the instances of Ghana, Tanzania and the southern cone countries of Latin America where outward-oriented strategy widened the trade gap rather than narrowing it down.

Actually significant export growth can hardly be achieved in the long run unless export promotion policies are also aimed at upgrading the quality of the exports.[2] This quality factor alone might explain to a large extent the asymmetric export performances of the outward-looking LDCs given the fact that the buyers in the industrialised countries are quality-conscious and more sensitive to quality alterations than to price changes. For example, as pointed out by Chatterjee and Marjit (1992), according to World Bank estimates India's export growth is expected to be stimulated at a much lower rate compared to Hong Kong and South Korea if the developed countries dismantle all their trade restrictions [WDR 1990]. This can also be explained in terms of poor quality of many Indian exports. Entry of Indian products in the western countries including the US are subject to meeting the ISO-9000 quality standards. In addition, the US is going to impose a new set of ISO-14000 environmental standards on Indian exports forcing the exporters to adopt 'cleaner technologies' for manufacturing.

In fact, the quality problem is apparent in all dimensions – from poor quality of production to poor packaging and delivery. The packaging problem is so serious that we lose foreign exchange worth of Rs 540 crore on an average every year due to rejections, spoilage and breakages arising from poor packaging. Engineering products are the worst sufferers of poor packaging accounting for more than 35 per cent of the foreign exchange loss, followed by garments and marine products accounting for 20 and 14 per cent of the losses respectively. In addition to the poor packaging, our exporters are also often not very punctual in delivering the goods which seriously affects reputation and future export orders. Similar situation prevails in other LDCs as well with notable exceptions of course. Let us briefly review some of the major theoretical explanations of such observed poor quality of many LDC-exports.

II
Explanations of Quality Problem

The major explanations of the quality problem are put forward in terms of 'informational externality' [Chiang and Masson 1981, Donnenfeld and Mayer 1987], high cost of overcoming quality moral hazards through seller reputations [Esfahani 1991] and in terms of negligible R and D efforts under a protectionist regime[3]. The informational externality argument runs as follows. Foreign buyers often have incomplete information about quality of products sold by an exporting firm. Accordingly, average industry quality instead of individual product quality determines the price the buyers are willing to pay which reduces the incentives for an exporting firm to produce socially optimum quality.



Esfahani (1991), on the other hand, suggests that the uncertainties in cost functions of small producers may be an explanation of the 'quality puzzle' in the seemingly competitive LDC-markets. Such uncertainties make sellers' commitment to uniformly high quality very costly and therefore encourage quality variations. On the other hand, easy entry puts a pressure on quasi-rents and reduces the benefits of continued operation which are the main incentives for maintaining reputation.

Another popular explanation is put forward in terms of protectionist trade and industrial regime. Protection typically leads to monopolisation of the domestic market by a few domestic producers and the consequent market structure may not be conducive to innovation. In other words, protection by ensuring high profits from sale of even poor quality goods reduces the incentives to upgrade quality through uncertain R and D and look forward to export markets.

A slightly different argument focuses on the X-efficiency aspect of liberalisation. Similar in spirit to the Schumpeterian hypothesis that "competition is not necessarily conducive to innovation",[4] Rodrik (1992) argues that protection providing larger market share increases at the margin the incentives for cost-innovations and is likely to spur technological efforts.[5] Suppose a domestic monopolist having higher marginal cost invests in technology and 'overall tinkering' and only after a particular point of time it fully catches up with the foreign technology. In such a case, liberalisation slows down the pace of productivity increase and delays technology catch-up since it shrinks the domestic monopolist's sales and thus reduces the incentives to invest in technology. On the other hand, in case of domestic duopoly with Cournot behaviour there will be over-investment in technology and "liberalisation will be inimical to technological performance".

What emerges from the analysis of Rodrik (1992) is that technology performance and exports depend on the 'nature' and 'intensity' of competition. While it is true that some market-power is a prerequisite for innovation and consequently liberalisation might adversely affect pace of the innovation, too much market power may not be conducive for innovation [Frenkel 1971, White 1974].[6] On the other hand, Porter (1990) has found little empirical support that "domestic competition is wasteful as it leads to

FIGURE. MINOR VS MAJOR INNOVATION

duplication of efforts and prevents firms from gaining economies of scale" Contrarily, the few 'national champions' with virtually unrivalled domestic positions are observed to be uncompetitive internationally though they are often heavily subsidised and protected Domestic rivalry creates pressure on firms to innovate and to sell abroad in order to grow (p 119) With little domestic rivalry firms are more content to rely on the domestic market"

III
Major vs Minor Innovation

In the whole literature, however, neither the relationship between liberalisation and quality-innovation has been clearly spelt out nor any attention has been paid to what guides firms to choose between the nature of innovation, cost (minor)-innovation or quality (major)-innovation, when both require investment in uncertain R and D projects For example, one peculiar aspect of India's technological development is that whatever little innovation has taken place has been 'minor' innovation including adaptation of process to indigenous raw materials instead of major innovations at the frontiers of technology [Desai 1980, Lall 1989] "In such circumstances, can the present liberalisation efforts through successive reduction of tariff rates reverse the trend' If so, how much tariff cut is needed' We now examine these issues in terms of a simplest possible theoretical framework

Let there be two types of good low-quality (L) and high-quality (H) While the domestic monopolist can produce the low-quality good at constant marginal cost (MC) and zero fixed cost, it does not have the technical know-how to produce the high-quality Only through 'successful R and D can it produce that good The trade regime is specified as follows There is an *ad valorem* tariff on low-quality final good, t, as well as a very high duty on an imported input required to produce goods of both quality The imported input can be replaced by an indigenous input which is only a poor substitute and its marginal productivity is so low that the MC of producing the low-quality final good using it is very high, say, $\bar{c}$ In case the imported input is allowed to be purchased duty free, the MC of producing the low-quality is equal to $\underline{c}$ But, the duty on the imported input makes the MC higher and suppose it exceeds $\bar{c}$. That is, the duty on the imported input is prohibitive This is the case as long as the firm sells its output in the domestic market only But if it is a 100 per cent export oriented unit (EOU), i e, sells the entire output in the world market, the government pays back the whole duty on the imported input

Suppose, while the world market for the low quality is perfectly competitive with world price, p_L^*, equal to $\underline{c}$, that for the high-quality good is imperfectly competitive. Such an assumption has two implications First is that the home firm will have no incentive to export the low-quality good, i e, exports require quality-innovation Secondly, without any tariff protection the domestic production of low-quality good ceases

Now, given the *ad valorem* tariff on low-quality foreign good, the domestic firm can charge a price equal to $(1+t)\,P_L^*$, but no more than that If such a price covers its MC of producing the low-quality good by using the indigenous input, $\bar{c}$, the firm will produce and, given constant MC, supply the entire demand at that price Suppose the demand function is linear,

$$p_L = a - x_L, \quad > 0 \qquad (1)$$

where, p_L is the tariff-inclusive price of the low-quality good and x_L is the quantity demanded Since the home firm essentially behaves like a 'price taker', its production of low-quality good will be,

$$x_L = a - (1+t)\,p_L^* \qquad (2)$$

and corresponding profit will be,

$$\pi(\bar{c},t) = [(1+t)p_L^* - \bar{c}]\,[a - (1+t)\,p_L^*] \qquad (3)$$

Thus, the domestic firm will produce only if,

$$t > \frac{\bar{c} - p_L^*}{p_L^*} = \tilde{t} \qquad (4)$$

Now it can be easily verified that as the tariff rate is raised higher and higher above $\tilde{t}$, home firm's profit increases at a decreasing rate reaching maximum at t_m, where t_m is such that,

$$(1+t_m)p_L^* = (a+c)/2 = p_m \qquad (5)$$

That is, for $t \geqq t_m$, the home firm can earn the monopoly profit by charging the monopoly price, p_m. Accordingly, domestic price, output and profit will remain invariant with respect to change in the tariff rate beyond t_m. In this set up, let us now examine the impact of liberalisation on cost and quality-innovation

Consider first the case of cost innovation. If such an innovation is successful, the home firm can produce the low-quality good at the lower cost, $\underline{c}$, and earn a profit equal to $\pi(\underline{c},t)$ On the other hand, in case of unsuccessful innovation the home firm must be satisfied with the pre-innovation lower profit $(\bar{c},t)$ Suppose, this minor or cost innovation has a success rate equal to 'q' and that it requires a fixed investment, F_c, only Then relative profit from minor innovation is given as

$$R\pi(t) = q\,[\pi(\underline{c},t) - \pi(\bar{c},t)] - F_c \qquad (6)$$

Now, given our assumption that $p_L^* = \underline{c}$, $R\pi(0) = -F_c$, and for $t > \bar{t}$, $R\pi(t) > 0$, where $\bar{t}$ is such that $R\pi(\bar{t}) = 0$. In other words, to induce the home firm to innovate around costs, there must be some degree of protection and this varies positively with fixed R and D cost, F_c, and inversely with the success rate, q We, however, assume values of q and F_c be such that $\bar{t}$ is very small.

On the other hand, suppose major or quality innovation has the same success rate, q, but requires greater fixed cost F_q:

$$F_q > F_c \qquad (7)$$

If quality innovation is successful, the home firm can export the high-quality good and earn a profit equal to, say, π_x "At this point we assume that the home firm sells the high-quality good only in the world market so that it can produce the good with the help of duty-free imported input On the other hand, when quality innovation is unsuccessful the home firm produces the low-quality good at the higher MC, $\bar{c}$, using the indigenous input and earns $\pi(\bar{c},t)$. Thus, the relative profit from major innovation and exports is given as:

$$R\pi_q(t) = q\,[\pi_x - \pi(\bar{c},t)] - F_q \qquad (8)$$

Clearly, $R\pi_s(t)$ is a decreasing function of the tariff rate.[11] Let, $\underline{t}$ be the rate for which $R\pi_s(t) = 0$. Therefore, if the tariff rate is too high, i e, $t > \underline{t}$, domestic market becomes relatively unprofitable compared to export market and the home firm is uninnovative and inward-looking

We are now in a position to examine the domestic firm s choice between minor and major innovation In this context we assume values of the parameters be such that $\bar{t} < \underline{t}$, otherwise the analysis becomes trivial Subtracting (6) from (8) we obtain

$$R(t) \equiv R\pi_s(t) - R\pi(t) = q[\pi_s - \pi(\underline{c},t)] - F \quad (9)$$

where, $F = F_q - F_s$

Now, $R\pi_s(O) > 0$ ensures that $R(O) > 0$; it is also evident that $R(t)$ falls with 't' Let, $\hat{t}$ be the rate for which $R(t)$ is zero In the accompanying figure we draw the $R(t)$ curve to illustrate the choice between minor and major innovation The $V(t)$ curve represents the 'gross' profit from major innovation relative to minor innovation, i e, $V(t) = q[\pi_s - \pi(\underline{c},t)]$.

Therefore what we observe is that the domestic firm will prefer quality-innovation to cost-innovation and consequently will look forward to the export market instead of being tied to the protected home market only if the tariff rate is lowered below $\hat{t}$ If the initial tariff rate, t_o is greater than $\hat{t}$, the required degree of liberalisation, $t_o - \hat{t}$, varies among others, inversely with F_s and q, and positively with F_q On the other hand, lower is $\underline{c}$, i e, lower is the MC of production when the duty-free imported input is used, and hence greater is $\pi(\underline{c},t)$ for a given tariff rate, smaller will be the value of $\hat{t}$ This means, more is the quality or productivity difference of the indigenous and imported input and consequently greater is the "gain" from cost innovation, greater will be the required dose of liberalisation to induce the domestic monopolist to innovate around product quality and become outward-oriented This analysis then provides an explanation to the findings of Porter (1990) that innovation is likely to occur around selective factor disadvantage.

IV
Conclusion

From the above analysis we observe that liberalisation does have a positive impact on the decision to export through quality innovation. All depends, however, on the nature and intensity of domestic rivalry, as well as on the opportunities in the foreign markets. But, full liberalisation is not at all a necessary condition. The required degree of liberalisation to induce the monopolist to innovate varies inversely with the level of investment in cost-innovation (F_s), and the success rate (q), and positively with the level of investment in quality innovation (F_q) and the gain from cost innovation, $(\bar{c} - \underline{c})$.

Notes

[I wish to thank Sugata Marjit for his valued comments and suggestions on an earlier draft The usual disclaimer applies, however]

1 But regression analysis of Colombatto (1990) with a sample of 47 LDCs in 1971, 1978 and 1985 reveals that higher export growth rates do not necessarily benefit economic growth

2 Recently government has decided to set up an India Brand Promotion Fund to promote the image of India as a supplier of quality goods and services wordwide as well as to protect Indian brands and disseminate information about them This may reduce quality distortions and deviations arising out of informational externality'

3 Another explanation of observed low quality is in terms of income disparities [see Gabszewicz and Thisse 1979]

4 All these competing theories have challenged the conventional view which focuses on factor endowment and technological conditions [Balassa 1980]

5 The literature identifies two hypotheses as Schumpeterian [Kamien and Schwartz 1982] (i) innovation and monoply power are positive-related, (ii) large firms are more innovative than small firms

6 An alternative explanation of the X-efficiency hypothesis is that protection increases the rents to the producers who then are inclined towards less work effort and more leisure thereby raising X-inefficiency But as pointed out by Corden (1974) this will be the case only if the labour supply curve is backward bending

7 For example, it is often argued that 'dominant' firms can concentrate only on exploiting the negatively sloped demand curve in the domestic market, and can avoid exporting as it increases demand elasticity since the firms essentially become 'price takers' [Glejser, Jacquemin and Petit 1980]

8 Porter (1990) cites the example of number 2 German competitor in pencils, Staedler, who concentrated very early on foreign markets because the industry leader, Faber Castell, had a strong hold on the domestic market

9 Another feature of India's technological development is that the inward-looking regime by protecting both efficient and inefficient firms has led to coexistence of few firms that are innovative and dynamic overseas with a multitude of others that rarely innovate and are tied to domestic market [Bhagwati and Srinivasan 1976, Katrak 1990].

10 To simplify the analysis we simply assume that the home firm can earn a positive profit by selling the high quality good in the world market without going into details of it

11 We must assume $q\pi_s(\underline{c}) > F_q$ so that $R\pi_s(O) > 0$.

DISCUSSION

Once More to Feminification of Theory

Saraswati Haider

THIS piece is an exposition of some thoughts on Dipankar Gupta's 'Feminification of Theory' (March 25) and the reply to it by Malavika Karlekar (June 17). This is not to say that the other communications which have appeared in the *EPW* do not demand consideration. For reasons which shall be clear in the following lines I have confined my argument only to the two mentioned above.

Gupta seems to be first of all trying to demonstrate that postmodernism and feminist studies get together and postmodernism has found most fertile ground in feminist studies among all the social sciences. And, secondly, he seems to be trying to plead a case for those lost, mostly postmodernist males, who, though eager to be feminist, find themselves marginalised by feminist academics for, in making the body the text, and in proclaiming that it is only women who can understand women, feminists condemn them to be actually ill-equipped to study the female sex.

In making his two attempts first of all, as Malavika Karlekar has rightly pointed out, Gupta has not pinpointed the feminists he is talking about. For, unfortunately, or may be fortunately, there is not just one group of feminists but several each with its own underpinnings of understanding of the woman question (as it came to be called in the 19th century). In fact the attempt to apportioning the meaning to feminism but the inability to either arrive at a consensus of opinion on what feminism is or accept a definition(s) that could serve as a point of unification have become a central problem within feminist discourse. "Without agreed definition(s) we lack a sound foundation on which to construct theory or engage in overall meaningful praxis" writes Bell Hooks, the Black feminist (1987 62). Carmen Vasquez, expressing her frustrations with the absence of clear definitions comments, "we can't even agree on what a Feminist is, never mind what she would believe in and how she defines the principles that constitute honour among us. In key with American capitalist obsession for individualism and anything goes, so long as it gets you what you want. Feminism in America has come to mean anything you like, honey. There are so many definitions of feminisms as there are feminists, some of my sisters say with a chuckle. I don't think its funny" [Vasquez 1983 11]. Delmar writes in the same vein that "the fragmentation of contemporary feminism bears ample witness to the impossibility of constructing modern feminism as a simple unity in the present, or arriving at a shared feminist definition of feminism. Such differing explanations, such a variety of emphases in practical campaign, such widely varying interpretations of their results have emerged that it now makes more sense to speak of a plurality of feminisms than of one" [Delmar 1986.9].

Delmar, however, professes that it is certainly possible to construct a baseline definition of feminism and the feminist, which can be shared by feminists and non-feminists. "Many would agree" she writes "that at the very least a feminist is someone who holds that women suffer discrimination because of their sex, that they have specific needs which remain negated and unsatisfied and that the satisfaction of their needs would require a radical change (some would say a revolution, even) in the social, economic and political order. But, beyond this, things immediately become more complicated", and that "recently the different meanings of feminism for different feminists have manifested themselves as a sort of sclerosis of their movement, segments of which have become separated from and hardened against each other. Instead of internal dialogue there is a naming of the parts, there are radical feminists, socialist feminists, Marxist feminists, lesbian separatists, women of colour, and soon, each group with its own carefully preserved sense of identity. Each for itself is the only worthwhile feminism, others are ignored, except to be criticised" [Delmar 1986 8-9]. Delmar however, misses naming liberal feminists, cultural feminists and the third world feminists who are also very much present on the scenario. A reading of Karen Offen's paper 'Defining Feminism: A Comparative Historical Approach' gives a good idea of the cross-cultural, i.e. American, British and European, development of the concept of feminism [Offen 1992].

Offen herself proclaims "what is feminism? what is a feminist? Across cultures? These questions are raised everyday by activists in the contemporary women's movement, by scholars in the press and in informal conversation. Everyone seems to have different answers and every answer is infused with a political and emotional charge. The word 'feminism' continues to inspire controversy – indeed even to invoke fear among a sizeable portion of the general public. If words and the concepts they convey can be said to be dangerous then 'feminism' and 'feminist' must be dangerous words, representing dangerous concepts. Despite Virginia Woolf's attempt some 50 years ago to 'kill' the word 'feminism', it continues to be used. The concept it stands for clearly retains 'a force of power' "

Offen continues, "Scholars who do claim a label of feminism owe it to the public and one another to respond to these questions and to address the fear that induces would-be supporters to disclaim this label even when they support what we would consider feminist goals. To allow so many to get away by saying, 'I am not a feminist but...' seems highly problematic in the light of current political necessities. To speak effectively, we must arrive at some understanding of the term 'feminism' that we can agree on. However, to be truly useful, such an understanding cannot be desired exclusively from contemporary Anglo-American culture. It should reflect the cumulative knowledge we have acquired about the historical development of feminism in other comparable cultures" [Offen 1992.69]. Offen then re-examines and reconceptualises the public understanding of the word 'feminism' based on the history of the word and its cognates and on evidence of its use from comparative history of England, America and the European countries. By doing this she discovers that by 1900 a veritable taxonomy of self-described or imputed feminisms had sprung into being. 'familial feminists', 'integral feminists', 'Christian feminists', 'socialist feminists', 'radical feminists' and 'male feminists' among others [Offens 1992 73]. She also discovers that there are 'proto-feminists' and, nowadays, 'feminists anti feminism', 'anti feminist feminism' and post-feminists' [Offen 1992:72, 73].

Offen writes in another place that contemporary scholars employ both dualistic and tripartite distinctions. Among the dualistic distinctions proposed in recent years are 'old' and 'new' feminisms, 'social' and 'hard-core' feminisms, 'first wave' and 'second wave' feminisms, 'classical' and 'modern' feminisms, 'equal rights' and 'female superiority' or 'equal authority' feminisms, 'maximalist' and 'minimalist' feminisms, 'congruent' and 'complementary' feminisms, and 'humanistic' and 'gynocentric' feminisms. Tripartite distinctions include the 'egalitarian', 'evangelical' and 'socialist' feminisms identified in the recent British past (that is since 1800) by socialist Olive Banks (1981). Alison Jaggar and others identify a present day 'socialist feminist' category distinct and separate from Marxist feminism, about which a sizeable literature has developed [Jaggar 1983]. To these Offens adds what she calls 'relational' and 'individualist' feminisms [Offen 1992].

One must also note here that Black feminists and third world feminists, including those of India, consider themselves as a breed apart from the Anglo-American and European variety of feminists whom the former consider imperialists, white and middle class thus having interests alien to the black and third world feminists engaged in struggles against race, class and colonial oppression in which they are united with their male counterparts. These feminists have agendas of their own

Thus, within this mind-boggling variety of feminisms, which one does Gupta have in mind, who he thinks have been enthralled by postmodernism, for not all of them could suddenly have come together in a much longed for, but not achieved, unity, and found postmodernism to be their awaited panacea? Had this happened it would be a singular achievement for it would have brought together the so far fragmented and disparate feminists But to disappoint Gupta, that has not happened. It is only a small group of western feminists, as Malavika Karlekar has pointed out, who are applying the theories of the postmodernists in their studies and where the west goes, can India be far behind. In India also there is only a handful of women academics who have turned to Irigarey, Lacan, Kristeva et al.

Gupta's tracing of the trajectory of feminism seems also not to conform to what one has read As far as our knowledge goes, it was the liberal feminists, whom Gupta does not mention at all, and who are still very much present, that first took to the course of women's rights. By liberal feminists I mean those who are known as 'first wave feminists' or suffragettes whose movement formally started at Seneca Falls in 1848. Marxist feminists came later on the scene primarily because, contrary to Gupta, embarrassingly for Marxists, and especially Marxist feminists, Marx is supposed to have totally ignored the presence of womankind in the reality that he was analysing.

Writes Michele Barrett, a Marxist feminist, "On the question of feminism, however, even the most committed Marxists now suspect that our idol has feet of clay. Many feminists, indeed, see this weakness as one which vitiates the whole of Marx's works. Gone are the days when 'the woman question' could be answered from the writings of Marx; his treatment of the issue is now widely regarded as scattered, scanty and unsatisfactory. The situation is scarcely improved by the fact that much of what is attributed to Marx, particularly in relation to a programme for the emancipation of women, was in fact the work of Engels. It is not entirely clear how far Marx himself accepted arguments such as those eventually set out in Engels' *The Origin of the Family, Private Property and the State* (1884)" [Barrett 1987: 44]. And again "In general the writings of Engels often read as more sympathetic to what we now identify as feminism than does the writings of Marx Engels appears to be more modern in his touch on these questions and one has less sense of a Victorian patriarch worthily espousing doctrines that he believes correct rather than believes in. Random examples are somewhat unfair, and can be misleading, but they illustrate the point. Engels can deride Duhring's solemn comment on the demand for prostitution '.. nothing of the kind is possible for the women'. He simply remarks that 'I would not care for anything in the world to have the thanks which might accrue to Herr Duhring from the women for his compliment' and wonders how Duhring has managed to get by for so long without having heard of men living on 'petticoat pension'. These sentiments would not disgrace a male Marxist in 1983, let alone in 1878 and they are characteristic of Engels' sympathy with women. Although, no doubt, a thorough search would reveal many sexist remarks in Engels' correspondence and private papers, one suspects that these would be little to match those 'howlers' that can be found in Marx"

Alison Jaggar, whom I quote at length, rather harshly pillories Marx and Marxists She has much to say about Marxism and feminism About Marxism, Gupta says "gender consciousness and feminism, in the generic sense, were not absent in Marxism, and indeed found their edge within the context of its larger theoretical problematic" and about which, and about whose connection with feminism, an interesting article to read is Hiedi I Hartmann's 'The Unhappy Marriage of Marxism and Feminism: Towards a More Progressive Union' (1981).

Jaggar writes, "Marxist theory was not designed primarily to provide an account of woman's nature and woman's oppression. What Marxism has to say about women is peripheral to the central claims of the theory, so that Marxist reflections on women's situation could be dropped entirely without changing the system in any substantial way. Instead Marxism was designed to explain how a minority of individuals is able to control the lives of the majority because of their control over the productive resources of a society. In order to explain this Marxists have recourse to their theory of class, a theory which has been enormously successful indeed in providing a unified explanation of many historical phenomena and much of the direction of historical change. In analysing contemporary society, we have seen that traditional Marxism [Jaggar calls another variety of feminists who are also Marxists but who have tried to couple together the Marxist thoughtful insights with the insights of the radical feminists, socialist feminists, as distinct from what she calls traditional Marxism] focuses on human beings in relation to commodity production and in this relation, of course, people appear only as members of classes such as bourgeoisie or the petit bourgeoisie. They are seen as having neither sex nor gender. Thus women in the market are viewed simply as workers rather than as women workers."

Jaggar continues, "while women in the market are invisible to Marxist political economy, women in the home are virtually ignored. Verbal acknowledgement is given to the necessity of procreative labour, but this long and complex process receives no theoretical attention. Marxist political economy assumes that, as Sartre puts it, an individual is born at the time of applying for 'his' first paid job. Women's procreative labour is not part of commodity production, that is, it is not part of the mode of production that defines capitalist society. Consequently, women who work at home do not have an independent place within a Marxist analysis of capitalism, they take their class position from that of their husbands and fathers (often, indeed, women's class position is assumed to be identical with that of their husbands and fathers even when they do work in commodity production. The result is an essentially gender-blind picture of social reality)"

"Social reality", writes Jaggar, "of course, is not at all gender blind and on a personal level all political theorists are aware of this. Even on a theoretical level, Marx and Engels not only acknowledge the necessity of procreative labour but make a tremendous contribution in pointing out that women's subordination is not 'natural', that women are indeed oppressed. But the remarkable success of their theory of class has led Marxists to assume that this concept of class is the master key to unlocking the secret of all domination. They assume that the most significant feature of contemporary society is its division into classes; that all history is the history of class struggle. They assume that, as Engels states, class has replaced kinship as the major organising principle of society. Consequently, they believe that class is what counts in the life of an individual, gender conflict is only apparent; class conflict is real. Thus while traditional Marxists recognise that there is indeed a 'woman question', they interpret this question as asking how women fit into the capitalist system of production."

To continue, Jaggar proclaims, "The traditional Marxist way of formulating the 'woman question' assumes that women are oppressed principally as a result of their exclusion from public production In contemporary times, this exclusion is disappearing; yet it is far from clear that women's oppression is diminishing. Feminists argue that many manifestations of women's oppression are not captured in the categories of Marxist political economy.

Women share common experiences of oppression, which, though they may be mediated by class, race and ethnicity, nevertheless cut across class lines All women are liable to rape, to physical abuse from men in the home, and to sexual objectification and sexual harassment; all women are primarily responsible for housework, while all women who have children are held primarily responsible for the care of those children, and virtually all women who work in the market work in sex-subjugated jobs In all classes, women have less money, power and leisure time than men "

Jaggar goes on to opine "Marxism's failure to provide an adequate historical account of the sexual division of labour is more than just an omission from the theory It is an omission that works systematically to obscure women's oppression Within the conceptual framework of traditional Marxism, some questions cannot be raised. For instance, there seems to be no specifically Marxist way of raising the question 'why it is men who routinely beat and rape women, rather than vice versa. Again, given the Marxist conception of class, it makes no sense to ask whether women might occupy a special class position '

'Women in the market share the class of their male co-workers and women outside the market are in their own right, outside the class system altogether Finally, given the Marxist conception of procreation as a process that is relatively fixed by biology, it makes no sense to raise political questions about what is done in this process and how it is done, about who does the work and who makes the decisions, or about how the organisation of procreation might be improved or made more democratic From the point of view of Marxist political economy, men have no special privileges and there are no special needs and interests that are shared by women and which are in opposition to the interests of men. The only exception is women's exclusion from so-called public production and that is only arguably in the interests of men and is, in any case, rapidly disappearing "

Jaggar then proclaims that "By discussing women's oppression, Marxist theory provides a rationale for its perpetuation. The biological conception of procreation legitimates women's continuing responsibility for procreative labour This responsibility in turn hinders women s full participation in non-productive labour and legitimates sex-regulation in that sphere At the same time the biological conception of procreation leads to the devaluation of procreative labour; women's work may be socially necessary but it is not fully historical and hence not fully human work Similarly, the biologistic assumption of hetero-sexuality together with the view that men's sex drive is biologically determined to be stronger than that of women, legitimates sexual harassment and rape. Taken together biologistic assumptions about procreation legitimate Marxism's focus on the 'masculine sphere' of commodity production as the main stage of history and its emphasis on class as the fundamental social division. They obscure the special oppression of women and so legitimate the view that any conflict of interests between the sexes is apparent rather than real. Women's struggle against their oppression is itself delegitimated "

Jaggar goes so far as to say that "The apparent gender-blindness of Marxist categories is in reality a gender bias... gender is a constitutive structure of contemporary human society By concealing this, Marxist theory mystifies social reality and legitimates the continued oppression of women Insofar as it is this, it is another ideology of male domination "

Jaggar concludes that "Just as traditional Marxist categories of social analysis are apparently gender-blind, so too is the traditional Marxist account of human nature on which they are based One writer states that Marxism presents us with a conception of human nature that is essentially of 'abstract, genderless individuals'. The gender blindness of the traditional Marxist account of human nature, however, like the gender blindness of Marxist social categories is apparent rather than real In fact, it is not a conception of humans as genderless, but rather a conception of humans as male, and one might add, as permanently adult. According to the Marxist conception of human nature, human beings create themselves and their world by labouring to transform nature to satisfy their needs Although this account is apparently gender-neutral, Marxists in fact have interpreted 'labour' to mean primarily the production and exchange of objects the kind of work that they associate with men As I have argued, they exclude much of women's work, and especially, procreative work from the category of labour and construe it more as biological process. The traditional Marxist account of human nature is in fact androcentric and constitutes the conceptual basis for a political theory that is profoundly gender-biased". [Jaggar 1983: 77-79]

In view of the above expostulations of Barrett and Jaggar, Gupta's claim that "gender consciousness and feminism, in the generic sense, were not absent in Marxism, and would find their edge within the context of its larger theoretical problematic" based on a few lines from *The German Ideology* ends up with a big question mark put in front of it

Gupta again tumbles when he includes Simone de Beauvoir within the coterie of Marxists when Simone de Beauvoir and Sartre, one thinks, were always basically existentialists adopting only some bits of Marxist theory to fill in the gaps in their existentialist intellectual baggage. But, they can certainly not be dubbed Marxists.

When writing about radical feminists, whom Gupta calls "male bashers", he again drops some bricks. He professes "After males were castrated what were the women to do: become men themselves? This was the only viable option which led women to smoke, drink, frequent strip clubs, and in some cases, shun men altogether " If the only viable activist option open to women was to become men themselves, how does "shunning men altogether" fit into this option? In actual fact it was the radical feminists, as one has been told, who did not want to become like men. They, in fact, deified womanly attributes The analysis of radical feminists has pointed out that there was a need felt among them to emerge from the cage of forced motherhood and sexual slavery which the radical feminists considered the main causes of women's oppression. The immediate goal of radical feminist politics, one believes, was for women to regain control over their own bodies In the long run radical feminists sought to build a woman culture, a new society informed by the radical feminist values of wholeness, trust and nurturance, of sensuality, joy and wildness In order to create such a society, radical feminists tried to prepare themselves. They needed a womanpace, a space free from male intrusion. In this space women could nurture each other and themselves They could begin to practise their own values and become clearer about them by doing so. They could develop the skills and the strengths forbidden to women under patriarchy. They could begin to lay the foundations on which the woman culture would be built [Jaggar 1983.270].

Many feminists, some quoted in this write-up in the beginning, in all probability, conditioned by the male need for domination and disinclination to exist with plurality, feel perturbed at the profusion of feminisms and feminists but it is felt that instead of being an unhealthy sign and anarchic, pluralism demonstrates a basic fact about any social reality or the complete or full perception of phenomenal truth Reality and truth are multifaceted, but more important, multivisional. They alter, change, taken on new nuances and new shapes from different standpoints But each of the truth-views and reality-views from varied standpoints contain within it some element of truth, some perception of reality, and is therefore valid from the particular perspective from which it is gazed at. Reality and truth cannot be captured in totality by one single gaze. They are too polychromic to be revealed *in toto* to any one individual. Therefore, the fact that a social reality like women's oppression gives rise to a myriad of perceptions, multiple viewpoints, hence

several feminisms, several feminists should not be surprising nor discomforting. Every reality is bound to have a plurality of dimensions and women's oppression is but one such reality. What is discomforting, however, and should be taken as not a healthy sign, is the rigidity that the advocates of each type of feminism, again in all probability, conditioned by the male penchant for individuation and subjugating, have developed instead of realising the fact that a multidimensional quality of the phenomenon of their interest is in keeping with an intrinsic quality to be found in any phenomenon, and initiating a dialogue between their, at present, fragmented selves, to arrive at a consensus and to accept the polychromic diversity of the reality that they are trying to expose, and find an explanation for, and with their individual bits of insights integrate and try to build up the reality in a fuller form To do so they have to respect each other's viewpoints and learn to exist within plurality and diversity and not try to outsmart each other and attempt to proclaim one view as supreme. They must, however, still be aware of the fact that the attainment of an ultimate and final truth, meaning or explanation of a reality is but a mirage and this is not only true about feminism but about any social reality The debate with the ghost of Marx still goes on. If postmodernists' mean all this by disclaiming truth, as Gupta claims they do, then they certainly have something meaningful to say and we must afford their viewpoint its due validity

At one point Gupta writes, and I quote at length, "unlike economics, or history, or political science whose field can be objectified, in sociology, it is up to the scholar concerned to come up with a research agenda which is above the level of interesting gossip or privatised obsession/version. For, in the ultimate analysis, a discipline can perpetuate itself as one only if the practitioners can rise above pure subjectivity. It is only then that the minimum conditions of arriving at consensus are present, whether or not the consensus is actually arrived at. In the same sense then a tendency that privatises an object of analysis can only do so on pain of undermining disciplinary specifics. No matter how attractive it might appear to knock down disciplines, the truth is that objective consensus cannot be arrived at without disciplinary goals.

"In my view this is why theories are important, too. Theories force the subjective to come out in the open and communicate with others in a situation of simulated objectivity. Simulated because nothing is objective in the absolute sense of the term but it is still possible to agree on the legitimacy of certain kinds of facts which are above the strictly personal and thus can be obtained without recourse to poetry, metaphor or trope. This is also why theories set out in advance their areas of competence, or also the order of facts necessary for their demonstration. But no theory lives in its own world but has to contest with other theories. If this contest is held in terms of incommensurable qualities then no advance, no communication, and no consensus can ever be conceived. A theory is a theory because it is open to other theories, and, *de jure*, willing to retreat if the agreed upon order of facts are openly hostile to it."

Gupta's above passages have a disturbing ring of dogma to them. They seem to leave no scope for entertaining any other point of view. This is the final word and thats it. The two passages smack of authoritarianism. For, are the rules of any discipline once laid down sacrosanct for ever? Can the rules of scientific endeavour be so rigid that they cannot be changed if found to be a hindrance in a more authentic collection and presentation of facts? Gupta's above discourse displays a marked tendency towards ossification and inflexibility, not healthy, one feels, for a dynamic, spirited, innovative, alive, ever-truth-seeking social science His discourse is very distinctly cast in a male world where military action words and words symbolising competition, a distinctive feature of the capitalist patriarchal order, abound Thus, we have contests, advance, retreat, hostility, without doubt symbols of a male supremacist lingo. The two passages leave an uncomfortable feeling that it is not consensus that is being sought but a battle of theories being fought.

I have quoted Gupta at length here to also bring out the fact how hopelessly confused he is where concepts of subjectivity and objectivity in scientific endeavour are concerned. How does a practitioner know what is pure subjectivity, less subjectivity, high subjectivity, etc. Is there an objective barometer within his or her system which indicates to him the degree of his/her subjectivity that is involved. If one is able to know what degree of subjectivity is involved in one's endeavour one cannot but know this only subjectively. Subjectivity is a state which is elusively unknowable and unpredictable for it is not only present in one's conscious being but one's unknown unconscious as well. It is indeed difficult to wrench out subjectivity from one's system as Gupta himself realises and says "nothing is objective in the absolute sense of the term". It is not easy to run away from one's subjectivity, which is such an integral part of ourselves and pervades all our actions, even those involved in the much-being-made-of Gupta's disciplinary grid if not consciously, then unconsciously. It is omnipresent in the way we formulate our hypotheses; the way we collect our data; the way we explain data, build our theories and in the way we present our findings. No matter how much we may wish it one has to realise that there is no escape from one's subjectivity. The use of the disciplinary grid seems to be just a formal ritual played out in a forcefully imposed so-called scientific academic procedure which all social scientists have been made duty bound to follow like a dictum but which in no way lessens the involvement of their subjectivity in their chosen pursuit. An adherence to the disciplinary grid in no way assures the sanitising of a social scientist's investigation from subjectivity which is highly tenacious and has a knack of cropping up at the most odd and unknowable of occasions without its owner being aware of it.

For Gupta to proclaim with such unshakeable certainty about a most chimerical phenomenon that objective consensus cannot be arrived at without a disciplinary grid particularly theoretical formulations, is an assumption only being claimed as truth perhaps without going in-depth into the matter The stress on objectivity has been made into a fetish and is, in all probability, a hangover from the days when social science was trying to emulate natural sciences In spite of the positivist approach horse being flogged umpteen times, the hangover persists. One has to repeat again and again that in social sciences it seems to be fairly obvious that there can never be any objectivity even if we try to simulate it and simulating is another of those self-deceiving acts which social scientists seem to go through without any purpose being served.

One does not know why these adherents of objectivity cannot by now have got wise to the fact that forced creation of objectivity by a social scientist also involves his or her subjectivity. He or she creates objectivity subjectively. The act of simulation of objectivity, which Gupta talks about, can but end up distorting the subjective but rich experience of reality that the social scientist may have gone through. Here simulating objectivity is like playing a game at the cost of sincere, honest, feelingful presentation of data in the very subjective and personal way the social scientist must have collected it. For, as far as one's experience goes it seems that authentic, revealing, flesh and blood data is perhaps only obtainable when one is intimately, subjectively and personally involved with one's subjects. When one does not go to them like an inquisitioner or an aloof, alien outsider but tries to become a part of their life within one's limitations.

But to come back to simulating objectivity – this again looks like the brainchild of the male species with their emphasis and inordinate valorisation of reason over emotions and hence objectivity over subjectivity. Theory building and use of disciplinary grids, even though they obviously cannot immunise one from subjectivity, seem to be games that male social scientists play to conform to their belief in deified reason and their denigration

of emotion which is considered to be an element of subjectivity and hence needs to be curbed. And why can consensus be arrived at only through a self-deceptive simulated objectivity? Why cannot consensus also be arrived at when data are presented subjectively? If postmodernists call Gupta's concept of theories fictions and are irreverent to his rigid disciplinary grid, as Gupta claims they are, then again post-modernists are perhaps only pointing out a truism, however much a bitter pill it may be for malestream social scientists to swallow.

Gupta in his paper also makes a highly unsubstantiated charge that feminist scholarship typically ignores those areas where women interface with men. This is just not correct as Malavika Karlekar has pointed out by furnishing titles of papers published in *Signs*, which journal Gupta in his paper has proclaimed as happy hunting ground of postmodernist feminist academics. Karlekar's point can be further corroborated by a glance through the contents of another feminist journal, *Feminist Review*, and by a look at the scores and scores of books being published abroad and in India within the orbit of what are known as women's studies which one hopes will bring home to Gupta that the "confident women" as he calls the non-postmodernist feminist social scientists, seem to be far outnumbering the postmodernism bitten "chained feminist sorority". This is, however, not to say that the views and studies of postmodernist feminists have no validity.

Coming to the subject of intersubjectivity which I think Gupta brings up to plead the case of those male feminists who, according to him, are dissuaded from studying the women's situation on the ground that they lack the sensitivity that women possess and that only women can understand women.

Intersubjectivity is, of course, a must for arriving at consensus and even if one does not feel so convinced about the objectivity of the simulated type Gupta seems to insist upon, subjective academic findings should also most definitely allow scope for intersubjectivity but where men and women are concerned the matter becomes tricky. It is a fact that men have shown and perhaps continue to show a singular insensitivity and lack of understanding of female sensibilities. They have, in fact, in the sciences totally invisibilised women. This, one feels, is because for centuries now women have been kept submerged in the 'culture of silence'; they have been muted; their experiences have remained unarticulated leading to the lack of understanding of their being by men who did not feel the necessity to acquire such an understanding and surprisingly neither did many women either. In such a situation men will have to allow women to give voice to their pent up emotions, feelings, desires, hurts, agonies, sufferings and aspirations, if in their intimidated situation they could develop any, now, that through women's studies, they have a chance to do so. Men will have to, for the time being, learn patiently to listen, for, listening is a very important adjunct to successful intercommunication. But male feminists, of course, cannot go on forever listening. They certainly should study women and women's studies can only be enriched by the contributions to them made by male feminists. For the time being, perhaps, one important contribution that male feminists can make is to study their own sex *vis-a-vis* their relationship with women. Masculinity within patriarchy needs to be studied as much as femininity. But as Malavika Karlekar asks, where are these male feminists? Gupta has raised aloft the banner for a tribe that does not seem to exist or exists in such a minuscule number as to be equal to not existing at all. Perhaps, Gupta has raised the banner aloft for himself? However, so much for Dipankar Gupta's paper.

Coming to Malavika Karlekar's reply to Gupta's paper, one feels she is at too great pains to establish that feminist academics are very much within Gupta's theory and disciplinary grid syndrome. What has been said about subjectivity and objectivity earlier in this piece can be repeated for Karlekar too. Karlekar now, with all her experience must, most surely, have realised that women are indeed different from men. They feel differently about situations, react differently, speak differently, relate differently to people and so on. They may be different because they have been an oppressed and marginalised group and are socialised as discriminated beings within a patriarchal order but different they are and it is felt that to study them, different perspectives, new methodologies, new approaches and even different styles of presentation of data about them are required. It is also felt that at the present juncture such experienced academics like Malavika Karlekar give their subjects a chance to speak, to have their say, to articulate, to start a discourse, to come out with all the bile and bitterness accumulated over centuries unimpeded, unencumbered, undisturbed by the intrusion of the voices of the academics who, it is felt, should refrain from using the voices of their protagonists to prove their (the academics') own theories, which is what is at present being done, following the 'malestream social sciences' disciplinary grid. It is felt that their conventional ways of proceeding with academic inquiries laid down by men to suit their own mind set are ill-suited to study the second sex.

It is felt that to study women – the pained, broken, fragmented, disembodied, suffering beings that they are new and more innovative models are needed. One also feels that in social science, especially where women's studies are concerned, there is a time just to hear and a time to analyse. The present, in feminist academics, it is felt, is a time to hear and for the time being to put theorising, analysing, all on the back burner. It is a time to take the narratives of women so trustingly recounted to academics and to use these narratives and the voices in which they are recounted as received to become a direct means to communicate the agony and the pain that womankind have been made to suffer. Let the suffering woman communicate directly with people at large with the academics serving as only conduits for the present to make such communication possible. The voices of those hapless victims of male domination should not be, it is felt, selectively used to prove the own-believed theoretical points of the academics. This, it is felt would amount to a betrayal and would most certainly rank as an exploitative act. One feels that for women academics, who are often also as alien to the psyche and behaviour of their subjects as men are to that of women, this is a time to get to know their in-other-ways subjugated sisters, to build bridges, to share, to bring their protagonists centre stage, to make them subjects and not to condemn them to be the 'other' once again or to use them to serve as guinea pigs in a patriarchal scientific model which model unfortunately, it seems, many women academics also unknowingly have adopted proving that patriarchy has deeper roots in woman's psyche, then one can think of or wrench away Patriarchy has, it seems, even the most aware of us still shackled by its devious chains.

DEFER YOUR INCOME FOR 2 YEARS...
...AND REAP ATTRACTIVE RETURNS
QUARTERLY THEREAFTER

DEFERRED INCOME PLAN '95

26% minimum targeted dividend payable quarterly for the third year.

CUMULATIVE OPTION

Income generated will be ploughed back and reflected in the NAV.

HIGHLIGHTS

◆ Close ended 5 year plan with 2 options.

◆ **DEFERRED INCOME OPTION**

Minimum targeted dividend of 26% p.a. payable quarterly for the 3rd year at the beginning of the quarter. Dividend for the subsequent years will be declared before the end of the preceding year and paid quarterly at the beginning of the quarter.

◆ **CUMULATIVE INCOME OPTION**

Income generated will be ploughed back and reflected in the NAV.

◆ Face Value : Rs. 10/- per unit, sold at par. Minimum Investment : 200 units and in multiples of 100 units thereafter. No maximum limit.

◆ Repurchase facility after 1st year at NAV based price.

◆ Tax benefits u/s 80L, 48 and 112 of Income Tax Act, 1961.

◆ Scheme open to Resident Indians, HUFs, Trusts, Societies, Bodies Corporate including non-profit making Companies.

◆ Deduction of tax at source from dividend income as per the Finance Act, 1995.

◆ For availing facility of non-deduction of tax at source, prescribed Form No. 15H may be furnished as per the relevant Rules.

UNIT TRUST OF INDIA
For your better tomorrow

Plan open from 1st Sept. to 25th Sept. '95

ADROIT 595

RISK FACTORS : All investments in mutual funds and securities are subject to market risks and the NAV of schemes may go up or down depending upon the factors and forces affecting securities market. Past performance is not necessarily indicative of future results. Deferred Income Plan '95 is only the name of the plan and does not in any manner indicate either the quality of the plan, its future prospects or returns. There can be no assurance that the Fund's objectives will be achieved. In the event of actual income not being sufficient to pay a minimum targeted return of 26% p.a. members may suffer loss of unit capital to that extent in the third year. Please read the offer document before investing.

Vol XXX No 37 September 16, 1995

Showing Labour Its Place

Karl Marx wrote *Das Kapital* less than a century and a half ago, inspired by the ideal to serve the interests of the working class. Arguing from the opposite perspective, and motivated by the final breakdown of the socialist economies, capital has now decreed how labour should behave if it is to attain a better future. The central message of the World Bank's capitalist manifesto, in the form of its *World Development Report 1995* devoted to the theme of 'Workers in an Integrating World', is how a drastic restructuring of the balance of power in favour of capital is a precondition for the economic well-being of the developing countries particularly. **2294**

Conflicting Moralities

The policy of the British colonial government on the making and drinking of indigenous liquor, ostensibly directed at checking intemperance and safeguarding the people's morality, often came into conflict with another morality, that of the peasants, especially the adivasis, and illustrates the impingement of the state upon what may be called the private, collective domain and the resistance, overt and covert, of the affected communities. A study in Thane district of erstwhile Bombay presidency. **2323**

Fiscal Reform

The World Bank's Country Economic Memorandum on India for this year reviews the progress of fiscal reforms at the central and state levels, but as in the past the emphasis is on reducing fiscal deficits rather than on increasing public savings. Moreover, the blanket assertion that there is no further scope for compressing government expenditure can only encourage vested interests to seek and obtain large increases in budgetary allocations. This assessment goes against the avowed objectives of the economic reforms of stabilising the economy and improving the efficiency of resource allocation. **2317**

Education and Mission

Neglect of the socio-political context of Christian education has come in the way of realisation of the liberating potential of its ideals and purposes. **2332**

Gone Haywire

The government's avowed objective of keeping the monetised deficit under check notwithstanding, the market's lukewarm response to its borrowing programme has pushed it into overwhelming dependence on the Reserve Bank. Unprecedented levels of monetised deficit in the current fiscal year so far have been the result. **2287**

Missing the Real Village

The concept of the revenue village was introduced by the British as the lowest administrative unit in the settlement hierarchy for revenue collection. The adoption of the revenue village by the Census for collection of data considered useful for micro-level planning and development, however, gives rise to many problems. **2301**

Pedagogy in Action

In the context of the present din over Total Literacy, a small effort by a social group from Calcutta at putting into practice a critical pedagogy should show our pedagogues how to stop canting and start acting. **2303**

'Empowerment' in History

While women's 'empowerment' is a concept of recent origin in feminist theory, women's struggle for empowerment, latent or manifest, visible or invisible, symbolic or concrete, is as old as the history of collective protest and resistance. A study of peasant movements and grass roots mobilisation in Bengal. **2306**

Abdication by UN

At the World Social Development Summit in Copenhagen the United Nations legitimised the role usurped by the Bretton Woods institutions, thus giving up its own powers and functions in the economic field mandated by its Charter. **2304**

LETTERS TO EDITOR

Mani Ratnam – And (Other) Midnight's Children

THIS piece should be called 'Roja and Bombay', to be fair. For I do not know any more of his work. He is a most talented film-maker and he makes a deep impression The music is good, the photography excellent. The story moves you and you come out full of that feeling which comes out of any really good aesthetic experience So what is all the noise about?

But there is a real problem. He has aroused so much protest, so much discussion And young(er) intellectuals are coming to his defence or expressing misgivings. To them Mani and 'Ham Aapke Hain Kaun' are events as important as, say, Ayodhya. For today's progressive – is not that an abuse? – and radical academics are no 'textbook Marxists', no crass mechanical materialists. Culture and feeling, ideology and experience are as much, perhaps even more, issues basic to human existence than mere hunger or physical subjugation.

But to return to Mani. 'Roja' did not hesitate to see Kashmir in black and white. No greys for him. The happiness of a charming young (Hindu) couple was so important. The militants there had no idealism. Their 'azadi' was no real thing. India's nationhood and, of course, its prosperous middle class was all. I could be being uncharitable. But this part of the truth about 'Roja' is indisputable verity

Then comes 'Bombay' If you ask why it could not have been a Hindu girl and a Muslim boy, you are being maliciously MCP, a victim of the ideology where girl is property and not person, free to love and being loved. But when you are vicious enough to ask why Bal Thackeray was allowed to preview and censor, however minimally or not at all, the same high idealistic tone is not adopted. Even Sathyu is cited, how reliably one cannot say, for having said when producing 'Garam Hawa' that it was better to avoid future trouble if it can easily be by such devices. But a similar effort is not made with, say, the Shahi Imam or Shahabuddin or even Rafiq Zakaria.

I must say, seeing 'Bombay' one felt no qualms about it at all. Until one remembered the foregoing. And then unfolds a larger and wider chain of thought. One would like to defend artistic freedom, creativity and admire talent and essentially laudable feats of creative endeavour all around. But there is a disturbing pattern which emerges from events like this of which our younger academics in their 40s or so are not always conscious. And they are understandably not. They have lived in a Hindu majority India, an independent India where they have not had communal riots as a daily fact not only of life but of political significance capable of determining the future in some very clear ways. Earlier, Jinnah was very much there and there was always the question of whether you will get a free and united India or not. The British were very much there, too, sitting as umpires ready to give their verdict, to adjudicate and divide. So one went on trying: *Hindu Muslim ek ho, Gandhi-Jinnah milen, Congress-League ek ho* or even *Congress League-Communist ek ho*. When the INA provided the occasion, it was Sehgal-Dhillon-Shahnawaz. We were called upon to *construct* and assert our national identity, to weld disparate looking communal (today's 'ethnic') entity(ies) into a national identity. We were always reminded that we needed to build not a Hindu but an *Indian* India which would be no mere 'geographical expression' as the British put it.

Midnight's children do not face this problem. But they also face – but do not always face up to – a deeper problem. Sudhir Chandra in his study of this question produces such a clear and erudite picture of it. These people have their India already made, or ready-made, for them. It is, Nehru notwithstanding, already a Hindu India into active but dangerous thing. One has known some of these innocent young (not so young now really) things to shift from strong anti-Mandalism during V P Singh's regime to *hallelujahs* to Mulayam's finesse when he won the UP elections last ("the exploited and the poor express their urges in caste terms" and "caste will break communalism as a political force", etc) and back again to reservations about the caste ideology of much of our politics. The problem is the lack of ballast in terms of either theory or experience which would provide stability to one's outlook. It is such an approach to India's society and culture which lauds Mani Ratnam's work and overlooks the dangerous but highly attractive cultural basis which he and others like him provide to the construction of an India which will look as 'secular' and 'modern', one suspects, as the US or the post-communist Czech or Yugoslav republics but which could be as Hindu – and oppressively so for non-Hindus, atheists and others – as you could think of.

ECONOMIC AND POLITICAL WEEKLY

Narrow Vision

THE Reserve Bank of India's annual report for 1994-95 is a cautionary document, contrary to first impressions. While it applauds the improvement in the overall performance of the economy, it reflects serious concern at developments in many areas of economic management. The report's earnestness in discussing, within the structural adjustment framework of course, the successes and slippages of economic, fiscal and financial policies is to be commended. Having said this, it must be added that many aspects of the RBI's review of economic developments are less than satisfactory. First, contrary to the impression the report seeks to convey, the RBI cannot absolve itself of responsibility for some of the areas of concern, such as the persistent price rise, the continuing fiscal mess and the low rate of domestic saving. Second, the report's explicit perception that it is enough to judge the performance of the economy in terms of macro numbers of GDP, agricultural and industrial production, budget deficit, export-import performance, the current account deficit and so on is seriously questionable. These macro numbers very often hide grave socio-economic malaise, as indeed they do in the case of the Indian economy today. Conspicuous in this respect is the silence of the RBI's report on the performance on the employment front, the impact of current policies on distributional goals, the adverse developments in the sphere of social infrastructure so vital for improving labour productivity and competitive efficiency and the long-term implications of the present policies towards foreign direct investment and investment by foreign institutional investors in the capital market. Finally, reflecting its well known prejudices, the RBI has shown little vision or innovation in regard to the need for special credit programmes for the poor and neglected sections of society and has generally moved only when it has been pushed by the government. Further, in the implementation of special credit programmes the RBI has willingly gone along with the commercial banks in diluting the importance of advances to agriculture, small-scale industries and other priority sectors. It is impossible not to be struck by the contrast between the RBI's disinterest in these areas and its high-voltage initiatives in the money and foreign exchange markets.

The central bank is not, of course, solely responsible for bringing about desired structural changes in the economy. But it cannot also hope to be left in splendid isolation to pursue monetary and credit policies geared to the sole objective of achieving price stability to the neglect of the more fundamental issues – for instance, growth of employment and incomes or the regional and functional distribution of the gains of development. These issues have now come to the fore all the more because, in the absence of physical planning and given the proven inability of the market to cope with structural distortions, financial policies and the financial system they seek to promote have to shoulder the burden of achieving many of the larger goals of development. The RBI's failure to perceive this and to incorporate it in its financial sector policy framework must be blamed for many of the current distortions in the economy. Consistent with its new-found enthusiasm for central banking autonomy, one wishes the RBI would also show greater concern for social goals in charting the development of the financial system. When, for instance, will the RBI disabuse itself of the notion that starting private banks for high-street banking will usher in competitive efficiency in the economy, except at a completely superficial level. There is not a word in the RBI report (except concerning prudential supervision) on the performance of the new private banks *vis-a-vis* the goals and objectives set for them.

The report has the usual glossy data on the economy's performance in the past year: accelerated GDP growth of 5.5 per cent, backed by 5 per cent and 8.4 per cent rise in agricultural and industrial production respectively, an impressive 24 per cent expansion of capital goods output, export growth of 17.9 per cent coming on top of a 20 per cent growth in 1993-94 and an average annual export volume growth of 12.6 per cent in the first three years of the Eighth Plan, non-POL import growth of 27.4 per cent and relatively stable balance of payments underpinned by a strong current account position. The external sector's role in the economy has grown significantly, with the share of exports in GDP galloping from an average of 5 per cent in the 1980s to a little over 9 per cent in the past two years. The merchandise trade (including imports) to GDP ratio has shot up from about 13 per cent in the 1980s to 19.8 per cent in 1994-95. To quote the report, "underlying the evolving openness of the economy is the strength of current earnings which underscores the ability to withstand both current account shocks as well as volatility in the capital account." Against these positive elements, the persistence of strong inflationary pressures throughout the year with the wholesale price index rising year-on-year by 10.4 per cent in 1994-95 on top of a rise of 10.8 per cent in the previous year and the deterioration in the government's fiscal position as reflected in the higher levels of gross fiscal deficit (whether put at 6.2 per cent or 6.7 per cent of GDP) and revenue deficit (3.8 per cent) than the original budget estimates have been areas of concern. The RBI report also raises the question of the sustainability of the growth rate achieved in 1994-95 with a domestic saving rate of just around 20 per cent of GDP and calls for steps to raise the saving rate.

But while these macro concerns are valid, what about the quality of growth? With their focus overwhelmingly on

liberalisation, marketisation and globalisation, the so-called economic reforms are making for acute inequalities in the distribution of incomes and wealth and inadequate societal support for such basic social needs as education and health care, which have implications for the already miserable standard of living of the common people and also limits the growth of labour efficiency and the size of the domestic market. Growth in the circumstances is necessarily narrowly-based with a strong built-in inflationary bias. In this sense, the growth in the recent period is very similar to that of the 1980s. The persistent revenue and fiscal deficits, essentially for financing unproductive expenditures, have generated sizeable domestic demand. The demand for industrial goods has been further augmented by large reductions in taxation boosting the incomes and consumption of the upper classes. The domestic saving rate has been pushed down further and there has been a significant diversion of resources away from development expenditures which have been curtailed in real terms. As the data presented in the RBI report shows, while the aggregate expenditures of the central and state governments have fallen from 32 per cent of GDP in the late 1980s to 29 per cent in 1994-95, the compression in development expenditures has been much more severe, from 64-65 per cent of aggregate expenditure in the 1980s to 53 per cent in 1994-95. Apart from the government's domestic borrowings, foreign capital inflows with implications for immediate increases in the country's foreign liabilities, particularly FII inflows into the capital market, have been responsible for the sharp increase in liquidity in the economic system which have in the short run helped to step up industrial activity. This cannot be hidden away behind the facade of the current account deficit in the balance of payments having been negligible, unlike in the 1980s. While the RBI approves of the liquidity generated by foreign portfolio inflows, it is hard on the government for indulging in large domestic borrowing.

The RBI may find it difficult to admit this, but its two supposed policy successes, namely, the formal agreement with the government on the use of ad hoc treasury bills and the stability of the rupee-dollar exchange rate have been made possible entirely by the sizeable foreign portfolio inflows. The RBI applauds the sharp reduction of the average monetised deficit in 1994-95 as unique in that, for the first time in almost two decades, monetary expansion during the year was not attributable to the monetisation of the budget deficit. This, it believes, "was rendered possible by the fundamental reform announced in the Union Budget 1994-95 and the agreement reached between the government and the RBI to delink automatic monetisation from the budget deficit". But the fact is that as soon as the portfolio inflows from abroad dried up in the current year the 'landmark agreement' collapsed and the use of ad hoes has generally remained well above the Rs 9,000 crore ceiling. Some limits on the recourse to ad hoc treasury bills are of course necessary for monetary stability, but the financing of government borrowing, albeit indirectly, through foreign portfolio inflows is hardly the way to achieve this. While the RBI recognises the importance of enlarging domestic saving, its own credit policies, as much as the government's economic and fiscal policies, have tended to stimulate lavish consumption among the middle and upper classes, and that once again on the strength of the liquidity gained by the banking system from the foreign portfolio inflows.

The RBI's policy stance on government borrowing is in fact rendering more intractable the stabilising of the fiscal positions of the central and state governments. The RBI has favoured a monetarist policy involving the elimination of the monetised deficit and, more significantly, the payment of so-called market related rates of interest on government borrowing. The nonchalant manner in which the RBI views the sharp increase in interest rates even up to 14 per cent on 10-year government bonds and the consequent rise in the government's interest burden enlarging the revenue deficit and the gross fiscal deficit reflects its narrow view of monetary-fiscal policy linkages. But for the agreement on ad hoc treasury bills interest rates on government securities would not have soared to the absurdly high levels they have in the current year. Again, discussing the root causes of the disequilibrium in the finances of the state governments, the RBI ignores its own role in their predicament by making them pay 14 per cent on their loans. Instead it pontificates: "In the milieu of a progressive increase in the coupon rates on state government securities and the prospects of moving to a full-fledged market determined system in the future, the pressure on state finances on account of interest payments is likely to accentuate. Phasing out of revenue deficits is, therefore, central to the reform process in state finances." Similar distortions have also been created by excessively shortening the government's debt profile which, combined with the large interest burden, has resulted in quicker repayment obligations, humps in repayments and enormous gross market borrowings. In spite of this being a problem created by its own policies, the RBI philosophises: "With steep humps in the projected repayment schedule, however, the government is likely to be compelled to go in for larger amounts of gross borrowings. This poses the danger of vicious cycle of higher market borrowings at a relatively higher cost, chasing higher repayments". The RBI's biases against broader developmental goals are exposed most clearly when it calls for the creation on a priority basis of amortisation funds, especially a consolidated sinking fund, even when there are no revenue surpluses, so that the burden of repayment in the future can be minimised. What is not realised is that the present generation is already making significant sacrifices having forgone expenditures on social services and infrastructures. To think of resources being generated for sinking funds for future repayment of government borrowings reflects a callous lack of concern for the imperatives of social and economic development.

It is similarly necessary to join issue with the RBI on its credit and monetary policies and its measures to build up the banking system and other financial institutions. The report provides no evidence of the success of monetarist policies; if anything, its contention that "it is misleading to think that there is a trade-off between growth and inflation" stands disproven by recent developments. Monetary impulses sent through indirect instruments such as interest rates and open market operations have not only failed to regulate the overall size of credit expansion, but have also contributed to its maldistribution. Non-food credit expansion in 1994-95 touched Rs 45,776 crore (30 per cent) or, if banks' investments in PSU bonds, corporate shares and debentures and commercial paper are also included, Rs 52,000 crore. While the RBI's contention that the rate of growth in credit in 1994-95 was "far in excess of the rate of growth in production" is debatable, there can be no doubt that its distribution was markedly skewed – something to which the RBI report makes no reference at all. Of the incremental non-food gross bank credit of Rs 39,378 crore (for a sample of banks covering 90-95 per cent of total scheduled bank credit), only 26.1 per cent went to the priority sectors in 1994-95, though there is a target of an average of 40 per cent for the banks in this regard and though these sectors contribute nearly 60 per cent of GDP originating in the commodity-producing sectors. In incremental bank credit the share of agriculture has turned out to be the smallest at 7 per cent followed by small-scale industries with 12.7 per cent. The RBI's focus on monetary targeting has thus led to credit distribution going haywire.

In the context of the vast diversification taking place in the financial markets, there is a strong case for the RBI reconsidering its present exclusive focus on M_3 and shifting it to credit aggregates — both the total flows and their distribution by sectors. Such aggregates have their direct impact on the ultimate target variables of monetary policy, namely, prices, output and employment, which matter the most. There is, however, no evidence of any awareness of the need for such rethinking in the RBI; it continues to function in terms of a one-to-one relationship between M_3 and the rate of inflation. For 1994-95 it had set an M_3 target of 15 per cent and an inflation target of 6 per cent. M_3 growth turned out to be 19 per cent and the inflation rate 10.9 per cent. These are elusive numbers and relationships and it will be in the interest of the credibility of the RBI's policies if it shifts its focus to credit

aggregate. It will then have more latitude to extend direct refinance and rediscount facilities to sectors that deserve such assistance. Today the RBI has become very tight-fisted on assistance to promotional agencies like SIDBI (additional credit of Rs 200 crore in 1994-95) and NABARD (Rs 960 crore), while it pumps enormous amounts of funds into the money market or, more significantly, into the coffers of the central government for financing its revenue deficit. When agriculture and the other priority sectors are starved of bank credit, the right signal for the RBI to send would be to provide sector-specific refinance and rediscount facilities to banks and the other promotional agencies.

TAMIL NADU

VVIPs Are VVIPs

THE chief minister of Tamil Nadu finally got away with it – 'the marriage of the century' – in spite of widespread protests from lawyers, citizens' forums and others against the gigantic waste of money on, and use of official machinery for, her foster-son's marriage ceremony.

For all their talk against ostentatious display of wealth and pledges to alleviate poverty, politicians of almost all the parties lapped up Jayalalitha's invitation. The VIPs who graced the occasion ranged from Congress stalwarts like the union minister for welfare, Sitaram Kesri, to the self-proclaimed champion of the poor, Laloo Prasad Yadav of Bihar. By participating in the vulgar show, all of them legitimised the shameless habit of flaunting wealth that marks the living style of the Indian *nouveau riche*, and their utter contempt for the sentiments of the poor majority.

What was however intriguing was the response of the judiciary. The All-India Lawyers' Union filed a writ petition before the Madras High Court three days before the marriage was to take place. It made a number of allegations – misuse of official machinery, illegal tapping of power supply, felling of trees to lay additional roads, encroachment on public roads by the setting up of arches, cut-outs and fixtures, among other things. The petition prayed that the court restrain the chief minister and the various authorities like the Madras Corporation from interfering with the free access of the public to amenities and utilities like power, pavements, etc, and from misuse of official machinery.

On September 4, in response to the petition, a Madras High Court judge passed an interim order restraining the state government from disrupting normal supply of water and electricity to the citizens. The next day, he directed the state's advocate-general to produce the files relating to permission sought for power supply and the source of lights on the arches and cut-outs. So far so good.

But on September 6 – the day of the marriage – the judge announced his decision to defer by a day his judgment on the petition. The reason was "pressure of work". The marriage ceremony took place with all the pomp – the arches and cut-outs standing to obstruct the roads and the lights blazing. The following day, after the wedding was over, the judge directed the Madras Corporation to remove all the arches and cut-outs, as "they had been erected without permission". One wonders why the judge had to wait for the end of the wedding to come out with his order for removal of the obstructions, after the damage had been done and the arches and cut-outs had served their purpose.

Stranger still are some of the comments made in the judgment. While the judge reprimanded the officials for being "mere spectators" to illegal acts of digging of roads and erection of arches, he took care to exonerate the chief minister. First stating that there was no evidence of her being directly responsible for these acts, the judge went a step further adding that even if she was, there was nothing wrong, since after all, VVIPs were VVIPs, and they could not be equated with ordinary citizens! If a high court judge can express such sentiments of helplessness that virtually lends legitimacy to the inconvenience caused to the public by the acts of so-called VVIPs, can one blame the ordinary citizens for losing confidence in the courts?

It is ironic that just a couple of days before these extraordinary words were uttered by the honourable judge of the Madras High Court, the Supreme Court delivered a judgment (on September 5) which, while recommending other things, set the standards to be maintained by judges – "The judges of higher echelons... should not be mere men [with feet] of clay with all the frailties and foibles... which may be found in those in other walks of life. In short, the behaviour of the judge is the bastion for the people to reap the fruits of the democracy, liberty and justice..." The Madras High Court judge may well have a second look at his decision to exonerate Jayalalitha in the light of the apex court's expectations from the judges of higher echelons.

INTEREST RATES

Case for Regulation

THE economic policies of the authorities in Germany and Japan on the one hand and in the US on the other speak volumes for their brazen pursuit of national self-interest. While there is so much talk of multilateralism, their policies are apparently guided solely by domestic considerations. Similarly, while free market principles are said to be in command, in reality powerful signals are conveyed to the markets to keep within prescribed economic and monetary bands.

There is a notion that central banks in the developed countries encourage free money market rates of interest to prevail. In fact, powerful instruments are employed to regulate interest rates. In the US, for instance, the federal funds rate, which member banks charge one another for overnight accommodation (corresponding to our call rate), is very firmly targeted and influenced by the Federal Reserve system. The discount rate, the other influential interest rate, is the rate which the Fed charges banks for loans from its discount window. Such effective presence of the central bank in the money market makes it possible for the entire interest rate structure to be modulated within limits. Real and nominal interest rates are not allowed to run wild as has been happening in our country.

After raising the federal funds targeted rate from 5.50 to 5.75 per cent in April and the discount rate from 5 to 5.25 per cent, the Fed has refused to alter these rates, though the economy has stumbled in the second quarter. The Fed has used the interest rates to send signals not only on the pace of domestic economic activity but also on exchange rate behaviour and its possible influence on the external sector. While the August 22 meeting of the Fed's policy committee chose to do nothing on the interest rates front on the ground that in view of a string of strong economic indicators there was little need for the Fed to stimulate the economy, it nevertheless authorised Fed chairman Alan Greenspan to reduce interest rates at his discretion in the third quarter for precisely that purpose.

The disclosure of the decision authorising the Fed chairman to reduce interest rates coincided with the Bundesbank's move to reduce short-term interest rates on August 24. The German decision was a sequel to the series of moves by the Fed which resulted in the strengthening of the dollar against the deutschmark and the yen. The German central bank, seeking to depreciate the mark and improve the German economy's performance, cut the discount rate from 4 to 3.5 per cent and the Lombard rate from 6 to 5.5 per cent. The discount rate is the lowest rate at which banks can borrow from the central bank to meet their short-term liquidity needs, while the Lombard rate is applied to loans that banks seek in emergencies, when they need additional funds. While the punitive Lombard rate serves as a ceiling rate on short-term rates, the discount rate serves as a floor.

It is significant that a band of minimum and maximum short-term interest rates is thus prescribed as a policy instrument in both the US and Germany, though the routes and instruments are different. What is important is the acceptance of the basic principle that in the interest of healthy economic growth a degree of regulation of the interest rate structure is a necessity. Otherwise short-term rates, as also long-term rates, can go haywire as has been happening in our country, with the call money rate zooming to 60-80 per cent at times and creating much uncertainty for the real economy. True, industrial economies can make do with regulation of a few short-term rates and the rest of the structure veers

round them because of the competitive conditions prevailing in their financial systems. In developing countries with dualistic financial systems, as in India, control of a wider range of interest rates is necessary for stability and growth. In any case, there is a strong case for ensuring that short-term rates, such as the call rate, are not allowed to fluctuate beyond a specified band.

NEPAL

Opportunistic Alliance

THE nine-month old government of Manmohan Adhikari had to finally step down for failing to outdo its rivals in the game of parliamentary arithmetic. The Nepali Congress(NC) and the Rashtriya Prajatantra Party(RPP), who represent divergent sectional interests, joined hands to pull down the government of the Communist Party of Nepal(CPN).

The minority government of Manmohan Adhikari came to power last November when no party succeeded in securing a majority in the Nepali Pratinidhi Sabha and the attempt to form a coalition government failed. Once in power, the communist government injected vitality into the administration which had become dysfunctional because of the internal bickerings within the NC under G P Koirala's prime ministership. The CPN government raised the allocation of development funds to the village committees to Rs 5 lakh and allotted Rs 2 million each to the 205 parliamentary constituencies, besides giving Rs 2.5 lakh to each MP. It granted women equal inheritance rights, abolished bonded labour, undertook land reform measures and gave land grants to two million landless. It reinstated government employees who had been suspended or terminated during the Koirala regime. It appointed a citizenship commission to look into the demands of the inhabitants of the Terai region who for several decades have been denied citizenship rights.

Thus, slowly but surely, the CPN government started to pose a threat to the support base of the opposition parties. Moreover, the government ordered a probe into the Royal Nepal Airlines scandal which occurred during G P Koirala's rule. This caused alarm in the central working committee of the NC. The warring factions of G P Koirala and K P Bhattarai agreed to patch up. The NC decided to withdraw support to the communists in June and placed before king Birendra the proposal to move a no-confidence motion against the government. A similar situation had arisen a year ago when G P Koirala had to face a no-trust motion against his government and had to resign. Only then there was no opposition party or coalition to stake a claim to forming a government. This time the Supreme Court conceded the demand of the opposition parties to form a coalition government, rejecting the ruling party's demand that the house be dissolved and mid-term polls held.

The NC and the RPP have agreed to share power in the new government, though the two parties differ sharply in their ideological orientations. The NC was in the forefront of the pro-democracy movement which was directed against the feudal elements that have now gathered under the banner of the RPP. Clearly the coalition of the NC and the RPP can only hope to keep the communists at bay till the next elections and cannot be expected to pursue a coherent set of policies.

JAPAN'S APOLOGY

What about the Others?

"DURING a certain period of time in the not too distant past, Japan followed a mistaken national policy of colonialism and aggression that caused tremendous damage and suffering to the people of many countries... I express my heartfelt apology and undertake to eradicate self-righteous nationalism in my country." Thus spoke Tomeichi Murayama, Japan's prime minister, on the 50th anniversary of Japan's surrender after the second world war.

Several countries consider this an adequate, though belated, apology by Japan for not only its aggression but also its massacres of civilians in the course of its colonial expansion. Other countries, like China and South Korea, which bore the brunt of the Japanese atrocities still feel that Murayama's apology is not adequate. It is well known that the main party in the coalition which Murayama leads is not quite reconciled to making an apology for Japan's colonialist and wartime aggression. Perhaps, in good time, even the LDP will have the good sense to offer apologies to its Asian neighbours.

The matter of Japan's apology, however, raises a larger question that historians are bound to ask – a question that concerns not just Japan's wartime and colonial record, but the record of other countries as well, some victorious and others vanquished in war. Those defeated in wars can be have made contrition as part of the terms of surrender they agree to. Whether that amounts to an apology, and that too from the heart, is a question one can keep debating. But are atrocities and excesses in war committed only by the side that is vanquished? To ask and secure from the vanquished an apology for its barbaric actions is not a big thing. What about the barbaric acts of the victorious? Is there to be no regret or apology for their excesses ever?

Murayama's apology is totally unqualified. He accepts the guilt of his nation and offers a 'heartfelt apology'. But why is no one acknowledging that Japan itself was the victim of possibly the most inhuman atrocity of this century when Hiroshima and Nagasaki were subjected to the nuclear holocaust? Is an atrocity not an atrocity whether it is committed by the victor or the vanquished?

But why confine oneself only to wartimes? Murayama was apologising for not just the wartime excesses of Japan. He was apologising also for his country's excesses during its colonialist rule going back to more than half a century. How many other colonial imperialist countries have offered apologies for their misdeeds? We in India remember every year the massacre of Jallianwala Bagh when thousands of unarmed civilians, including women and children, were done to death. Has a British prime minister ever offered an apology for his country's atrocities in its erstwhile colonies? Why apology, not even a word of regret has been offered so far.

Mass atrocities are still being committed in one or another part of the world. Nuclear arsenals are still held by several countries. So the threat of potential holocausts continues to hang over the world. Whether or not the perpetrators of inhuman excesses apologise retrospectively or not, more important is it to make the world secure against excesses, wartime or colonialist, in the future.

NEW BOOK FROM **MD** PUBLISHERS OF THE HUMANITIES NATURAL & SOCIAL SCIENCE

WOMAN, MARRIAGE AND FAMILY

Edited By

Man Singh Das & Vijay Kumar Gupta

1995, 118p, references; 22x14cm
ISBN 81-85880-78-6 160.00

This book discusses about women's adjustment, role commitment, satisfaction, decision-making, etc in marital relations and also focuses on marriage in the Hindu tradition

Over the past month, there has been a sudden easing of liquidity which is reflected in a sizeable expansion in bank deposits accompanied by rise in non-food advances and investments. The increase in net RBI credit to the centre in the fiscal year, though much lower than the levels touched in previous weeks, was still high at Rs 14,256 crore on August 18 (against a decline of Rs 3,760 crore in the same period of 1994-95). Exports rose by 30 per cent and imports by 39.4 per cent during April-July 1995, further widening the trade deficit. Capital goods, non-electrical machinery in particular, and chemicals and related products contributed to the import growth. Cotton yarn and fabrics helped to accelerate export growth.

ASHOK LEYLAND

Expanding Range

ASHOK LEYLAND (ALL), a Hinduja group company, closed its financial year ended March 1995 with a turnover of Rs 1,334 crore, up by 26 per cent over Rs 1,059 crore recorded in the previous year. Net profit has been more than doubled from Rs 35 crore to Rs 71 crore. A dividend of 35 per cent has been recommended against 27 per cent in the previous year. For the third year in succession a zero tax provision was made by the company.

On the export front the company sold 1,739 vehicles for Rs 131.8 crore. Exports came down by 6 per cent, the reason being a decline in exports to Iran. Imports on the other hand grew by a whopping 374 per cent. ALL is targeting a Rs 200 crore export turnover for this fiscal year

The company has four plants in Ennore, Hosur, Alwar, and Bhandara The Leyland series of vehicles, Viking and Comet, along with Leyland engines are manufactured in the Ennore facility. The company plans to modernise the Ennore facility. Hosur has two plants. Hosur I produces Hino and Iveco engines and heavy duty multi-axle vehicles like Tusker and Taurus The second plant manufactures the Cargo series of Iveco vehicles The Bhandara unit makes transmission systems like gear boxes and has an assembly line for Leyland vehicles The Alwar unit has a small assembly line for Leyland vehicles.

ALL introduced the Cargo range of intermediate commercial vehicles (ICV) modelled on Iveco's Eurocargo, made with Iveco technology, in October 1994, and in the six-month period ending March 1995 sold 1,000 vehicles. The cargo vehicles have a capacity of 4 to 7.50 tonnes, which is more than that of a light commercial vehicle. The company's strategy has been to slot a vehicle in every segment. While its traditional strengths have been in medium commercial vehicles of 16 to 20 tonnes capacity and in heavy duty vehicles of 25 tonnes and above range, it decided that the product range lacked a vehicle in the lower capacity segment, leading to the birth of the Cargo. The company has received orders for the vehicles from countries such as Kenya, Vietnam and South Africa.

The company at present has a 29 per cent share of the market against the 71 per cent of Telco. Telco is a strong competitor in the northern markets where ALL does not have much of a presence. To strengthen its position in the northern markets it is necessary for the company to enhance its dealer and service networks

Total sales of the company were 30,410 in 1994-95, an increase of 26 per cent over the previous years. Sales of industrial and marine engines were 5,258 units, less by 400 over the previous year. ALL's Leyland engines find uses in industrial (gensets) and marine applications. In the marine engine segment there is not much competition to Leyland engines. The company has been exporting engines mainly to Iran. The company is slowly phasing out the Leyland engines for vehicles, replacing them with Hino and Iveco engines. Sale of parts at Rs 159.6 crore registered an increase of 13 per cent over the previous year.

The company has planned investments of about Rs 1,600 crore for upgrading and increasing capacity in phases that would see it increasing its market share to 40 per cent in the next five years. The first phase was complete with the commissioning of the second plant at Hosur for which the company spent about Rs 1,000 crore. An investment of about Rs 500 crore has been planned for the second phase over the next five years. The money for these expansions will come from internal accruals apart from the proceeds of the Euro issue that the company made in March 1995. 10.77 million GDRs were issued by the company at $ 12.79 per GDR, each to be converted into three equity shares The issue fetched Rs 436 crore.

ALL has promoted Ashok Leyland Finance (ALF) primarily to provide hire purchase finance to transport operators for buying commercial vehicles It is also involved in equipment leasing The company is scouting for partners to set up a joint venture in Sri Lanka. ALF's associate company Ashok Leyland Investment Services (ALISL) looks after the investment and merchant banking activities

Ashok Leyland is considering a tie up with Renault of France for a car project, amidst speculations that the company would partner Fiat. The tie up of Fiat with Premier Automobiles for the Uno model led the company to consider Renault of France. The joint venture would be for the manufacture of passenger cars. Preliminary discussions also held with Renault in the areas of auto components and multi fuel engines.

MOTOR INDUSTRIES

New Products

Motor Industries Company (MICO) is India's leading manufacturer of fuel injection equipment, spark plugs and electric power tools for the automotive industry for over four decades. The company also trades in an assortment of auto components. It also manufactures most of the components required for fuel injection pumps such as elements, delivery valves and nozzles.

A satisfactory performance by the company in 1994 was aided by the upswing in the automobile industry. The company registered a sales turnover of Rs 646 crore for the year ended December 1994, up by 15 per cent from Rs 563 in the previous year. The company recorded a net profit of Rs 37 crore, up by 50 per cent from Rs 25 crore in the previous year. Net profit would have been higher were it not for an increased tax provision which rose by 65 per cent from Rs 29 crore to Rs 47 crore. A dividend of 20 per cent has been recommended by the directors as against 8 per cent in the previous year

Performance on the export front was satisfactory. Exports registered a growth of 26 per cent. A corresponding rise was seen in imports of raw materials, components and spare parts and capital goods which moved up by 59 per cent. There was a net foreign exchange outflow of Rs 12 crore.

The company plans to enter the domestic market with a new range of hi-tech automobile products, petrol injection devices and anytime skid braking equipment. According to MICO chairman, Hermann Eisele, "the petrol injection devices will not only increase fuel efficiency but it would also bring down the emission level". Discussions are on with present and future car manufacturers to introduce these ancillaries in their vehicles. Though the company has set itself an export target of 15 per cent for the current year, it would be touching only 12 per cent, the reason being the higher demand for the products in the domestic markets.

The company is in the process of establishing a manufacturing centre at Baroda for producing components for fuel injection pumps at an estimated cost of Rs 100 crore. MICO's German collaborator, Bosch, which holds 51 per cent of the company's equity, manufactures a wide range of products and thus technology for several products was available with the company.

KESORAM INDUSTRIES

Out of the Red

Kesoram Industries, a B K Birla group company with diversified interests, has made a remarkable turnaround by coming out of the red and posting a net profit of Rs 21 crore for the year ended March 1995, after sustaining a loss of Rs 6 crore in the previous year. Net sales were up from Rs 613 crore to Rs 622 crore. Gross profit stood at Rs 55 crore, up from Rs 27 crore in the previous year. A dividend of 15 per cent has been recommended by the directors against 10 per cent given last year

The performance of the textile section was not very satisfactory as a result of a combination of a variety of factors There was an unprecedented rise in cotton prices which the company was not fully able to pass on to consumers. The result was that the

varieties. The company has started modernisation of the spinning division in a small way.

The rayon and transparent paper division performed satisfactorily with improvement in profitability, production and quality. The process of converting conventional spinning machines to improved tube spinning is continuing and a further improvement in the quality of rayon yarn is expected. The cost of production increased as a result of increase in the price of raw materials, viz, pulp, caustic soda and sulphur.

The performance of the spun pipe section was satisfactory on account of improved availability of pig iron, the main raw material. Diversification of product range and concentration on sales to new projects have led to improved performance of the refractory section.

Increase in demand of cement by the private sector pushed up cement production in the country by 8 per cent in 1994-95. The company's two cement units Kesoram Cement and Vasavadatta Cement, performed satisfactorily. The energy reducing measures brought down average power consumption to 96 units per tonne of cement from 104 units in 1993-94, perhaps the lowest in the country for a plant of this capacity. The company proposes to expand cement capacity by 6.86 lakh tonnes per annum, with orders for the main equipment have been placed with Krupp Industries India and Krupp Polysius of Germany. The new plant is expected to be commissioned by the first quarter of 1997 at an estimated project cost of Rs 231 crore. Modernisation of the existing plants is also on the anvil at an estimated cost of Rs 50 crore.

Birla Tyres, run by a consortium, in which the company has a 20 per cent stake, performed satisfactorily with a significant improvement in production and product quality. Prices of tyres could not keep pace with increases in prices of raw materials, power and chemicals. Birla Tyres was accredited with the ISO 9001 certification for its quality management system.

The company's subsidiaries, Bharat General and Textile Industries and KICM Investment, performed to satisfaction. The extraction division at Malkapur of Bharat General and Textile Industries exported groundnut extraction worth Rs 145 lakh. Deoiled meals of soyabean and other cakes which brought in Rs 517 lakh in the previous year could not contribute to export earnings for the year under review because of high prices coupled with the poor availability of soyabean seeds on account of lower crop production in Madhya Pradesh.

Exports were around 7 per cent of the company's sales. The company penetrated the markets of Australia, while continuing export of paper to neighbouring countries like Bangladesh and Sri Lanka. Exports to the US were 40 per cent of total exports.

RBI to Government's Rescue

The government's avowed objective of keeping the monetised deficit under check notwithstanding, the market's lukewarm response to its borrowing programme has pushed it into overwhelming dependence on the RBI. Phenomenal levels of monetised dificit have been the result.

I
Secondary Expansion in Liquidity

THE easy liquidity position noticed since the middle of July reinforced itself during August. This was as much on account of the lagged effect of the reserve money growth induced by the government's recourse to ad hoc treasury bills and other forms of monetised deficit as it was on account of the maturity of 364-day treasury bills of almost Rs 6,000 crore in three tranches of approximately Rs 2,000 crore each over the month on August 4 and 18 and September 1. After a tight spell for almost six months since February, the sudden flush of liquidity has been quite revealing. Between June 23 and August 18, aggregate deposits of scheduled commercial banks expanded by Rs 10,493 crore against a rise of Rs 7,671 crore in the corresponding period last year. Last year the principal source of bank deposit expansion was the sizeable foreign exchange accrual, whereas this year it has made a distinct negative contribution. Since the beginning of the current fiscal year and up to September 1, foreign exchange assets (excluding gold) have declined by Rs 5,315 crore whereas in the corresponding period last year there was a rise of as much as Rs 7,750 crore; the loss of reserves began to be reflected in the pressure on the exchange rate of the rupee. It is the rapid and phenomenal rise in net RBI credit to the central government during the first quarter of this financial year – Rs 12,999 crore against Rs 1,707 crore last year – that seems to have given rise to secondary expansion in bank deposits during the subsequent period. Within two months since June, expansion in broad money (M_3) has been an unprecedented amount of Rs 10,170 crore as compared with Rs 6,260 crore last year.

Despite the authorities' avowed objective of eschewing monetised deficit, such large dependence on the RBI has been necessitated by the market's lukewarm response so far this year for the government's borrowing programme. The government has so far raised only Rs 11,753 crore out of the total gross borrowing programme of Rs 41,000 crore. By August last year, the government had raised as much as near Rs 20,000 crore. As a result, the government has not been able to reduce its dependence on ad hoc TBs below the limit set, though in the month of August there has been some downward trend. Alternatively, the centre's budget deficit as well as monetised deficit has touched phenomenal figures as shown in Table 1.

The presence of excess liquidity with the banking system is partly seasonal, reflective of the return flow of funds during the lean season. Generally, the demand for bank credit slackens during the period but this year due to high tempo of activity in the industrial sector, non-food credit expansion has been Rs 5,104 crore between June 23 and August 18 against only Rs 2,666 crore in the comparable period of the previous year. Despite such high level of credit expansion, scheduled commercial banks have been able to make additional investment in government securities worth Rs 3,167 crore during the period against only Rs 1,537 crore in the comparable period last year – yet another sign of easy liquidity (see Table 2).

II
Government Borrowings

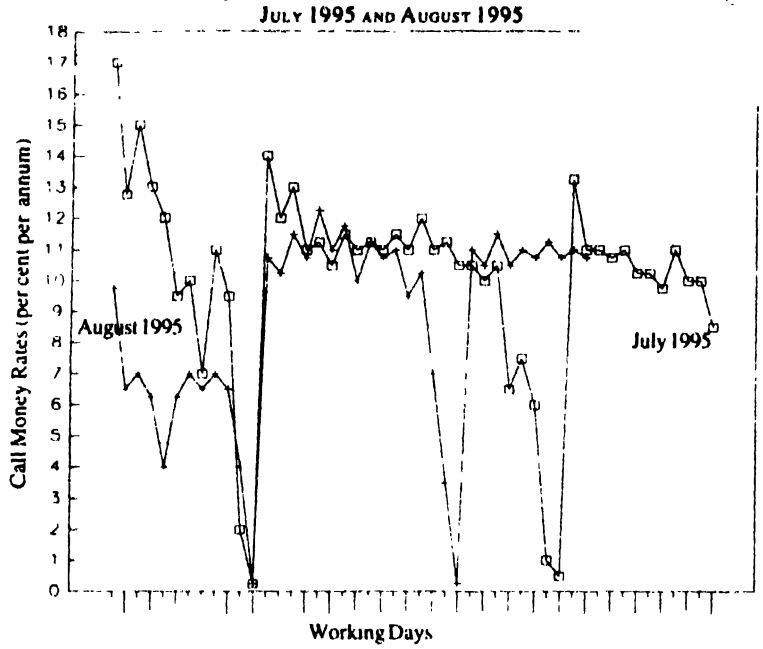
Dated Securities

The government continued to focus on raising 'other medium- and long-term loans' during August, there were two fresh issues of Rs 2,000 crore each through auctions during the month: a three-year paper in mid-August and a two-year paper at the end of August.

Since the beginning of this fiscal year, the government had raised money through several long-term papers ranging from 7 to 10 years with unprecedentedly high yield rates of 13.75 per cent to 14 per cent per annum. The Reserve Bank had come under sharp criticism for locking the government into long-term paper at a high cost. Given the liquidity strain and uncertainty on the interest rate front, the market had been cautious towards investing in such long-term assets. Moreover, the net borrowing programme of the government through the conventional route had already been completed in June. The Reserve Bank has thus focused on raising funds for the government through short-term paper since then.

As there were nearly Rs 6,000 crore worth of 364-day TBs maturing in August, the market expected a conversion announcement in the beginning of the month. The Reserve Bank, however, chose to approach the market directly with a three-year and a two-year papers. Both the papers received enthusiastic market responses with oversubscriptions. The cut-off yields allowed on the three-year paper at 13.65 per cent and the two-year paper at 13.50 per cent, were decidedly high for such short-term papers and even higher than the market expectations. Last year a three-year paper was accorded 11 per cent yield and this year as late as on July 10 a two-year paper fetched 13.25 per cent; these were conversion offers and hence the rates were slightly higher than usual even at that time. This clearly indicated the impact of the massive borrowing programme of the government, the fiscal strain and the authorities' anxiety to fulfil the programme this year.

The Reserve Bank announced the three-year paper for a notified amount of Rs 2,000 crore on August 8 with the auction to be held on August 17. The improvement in market conditions by then, as also reasonably short tenure of the paper and the availability of repo facility, helped to attract substantial investment for the security. The Reserve Bank received Rs 3,666.88 crore through 248 bids, out of which it accepted Rs 2,000 crore in 179 bids at a cut-off rate of 13.65 per cent.



The available indications in the market were pointing towards a declining trend of interest rates with cut-off rate on both, the 91-day and 364-day TBs moving downwards. In fact, just on the day before the auction of dated paper, the Reserve Bank had rejected a large number of bids received in 364-day TBs and kept the yield low at 12.90 per cent. It had accepted Rs 24 crore and rejected Rs 711.70 crore.

Earlier, the government had offered 14 per cent on a 10-year paper, 13.85 per cent on a five-year paper (zero coupon bond) and 13.25 per cent on two-year paper during this financial year. As such, the market had at best expected a cut-off rate of 13.50 per cent for a three-year paper. The option exercised by

TABLE 1: BUDGET DEFICIT AND MONETISED DEFICIT

	Variation over March 31, 1995 (Rupees, Crore)						
	July				August		
	7	14	21	28	4	11	18

Budget deficit	18,954	–	21,633	–	21,786	–	17,890
Monetised deficit	20,583	20,925	21,075	16,999	18,479	18,594	14,256

GRAPH A: DAILY QUOTATIONS OF HIGHS AND LOWS OF CALL MONEY RATES, JULY 1995 AND AUGUST 1995

the authorities to settle the cut-off yield at the higher end of this interest rate band reflected the pressure on government finances, particularly in the context of the runaway recourse to ad hoc TBs.

There is another source of surprise at the cut-off rate given by the Reserve Bank. Of the 179 bids which were accepted, 31 bids at the cut-off yield were partially accepted. This meant that as many as 148 bids were at lower yields than the cut-off yield of 13.65 per cent (though the amount involved is not known). It was, therefore, not as though there was no scope for sending appropriate signals to the market on reducing yield rates in the context of the lean season liquidity ease. The issue also synchronised with two maturing dates of 364-day TBs – Rs 2,120 crore on August 4 and Rs 2,220 crore on August 18.

A fortnight later the government once again came to the market. On August 24, the Reserve Bank announced the auction of two-year paper also with a notified amount of Rs 2,000 crore. To be held on August 31, this auction, like the earlier one, was scheduled between two maturing dates of 364-day TBs – Rs 2,220 crore on August 18 and Rs 1,900 crore on September 1. There was reason to expect good support for this paper at a reasonable yield. The Reserve Bank received Rs 2,714.86 crore in 203 bids. Out of these, it accepted Rs 2,000 crore in 154 bids at a cut-off yield of 13.50 per cent; 39 bids at the cut-off yield were partially accepted.

364-day Treasury Bills

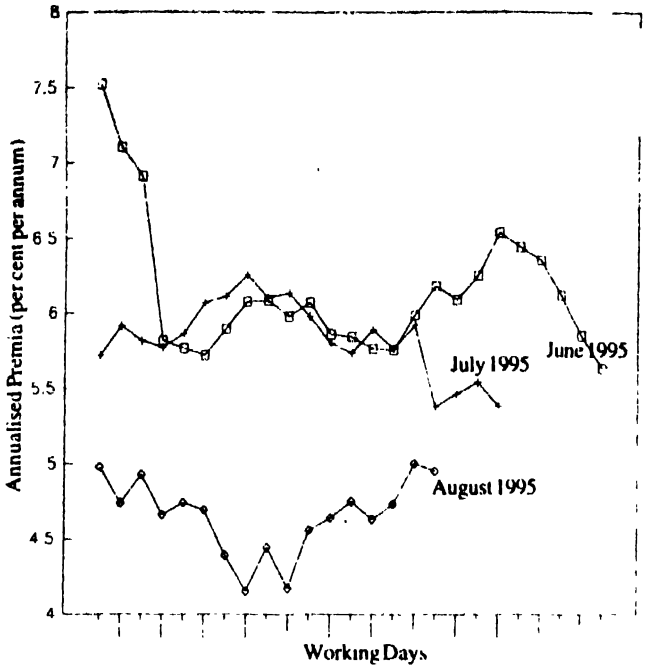
The government raised as much as Rs 1,023.25 crore through three auctions of this paper during August. The auctions, significantly, were generally held each time a day prior to the auctions of dated securities. The first auction held on August 2 was an exceptional one which attracted a subscription of Rs 834 crore at a cut-off yield of 13.16 per cent, the same as given in the mid-July auction. In the subsequent two auctions the Reserve Bank accepted only Rs 24 crore and Rs 165.25 crore, respectively, and bought down the yield significantly by 25 basis points in both the issues as compared with the yield of 13.16 per cent given in July and early August.

Although weak compared to the market response to this paper during comparable period last year – the government had raised Rs 6,240 crore at an average yield of 9.54 per cent during August last year (Table 3) – the response to this paper during August this year has been better when compared with the response of the preceding eight months.

91-day Treasury Bills

In the four auctions held of 91-day TBs during August, Rs 2,000 crore were raised, of which only Rs 73 crore devolved on the RBI (Table 4); in July as much as Rs 761 crore devolved upon on the central bank. In August there have been some reductions in the cut-off yield rates from 12.97-12.71 per cent in July to 12.67-12.58 per cent. Interestingly, the amounts bid under the four 91-day TB auctions aggregated over Rs 4,400 crore, almost equal amounts coming from competitive (Rs 2,148 crore) and non-competitive (Rs 2,255 crore) bidders. Likewise, their actual subscriptions accepted were Rs 927 crore and Rs 1,000 crore, respectively. With the maturing of over Rs 6,000 crore worth of 364-day TBs and another Rs 4,000 crore worth of two government securities by mid-October, the market will surely need more of short-term paper.

Stickiness in Downward Revision of Interest Rates



Overall, the discount rates offered on TBs and yield rates on dated securities continue to be relatively high. Against an annual inflation rate of about 9 per cent, the 364-day and 91-day TBs have been fetching yield rates of 13.16-12.87 per cent and 12.67-12.58 per cent, respectively, thus suggesting real rates of 3.50 to 4 percentage points which appear prohibitively high for such short-term papers. With the yield rates ruling at 13.75 to 14 per cent on dated the securities, real rates also would work out to about 4.5 per cent. Secondly, the yield rates on government paper were

TABLE 2: A FEW MACRO FINANCIAL INDICATORS: VARIATIONS

GRAPH D: YIELD CURVES FOR 364-DAY TREASURY BILLS AND DATED SECURITIES - WEIGHTED AVERAGE FOR THE LAST WEEK ENDED AUGUST 25, 1995

GRAPH E: YIELD CURVE FOR 364-DAY TREASURY BILLS AND DATED GOI SECURITIES COMBINED - A SINGLE DAY IN THE MONTH WITH MAXIMUM TRANSACTIONS (AUGUST 25, 1995)

pushed up very rapidly during the past one year from about 8 to 9 per cent to the highest rate of 12.97 per cent in the case of 91-day TBs and from 9 to 10 per cent to over 13 per cent in the case of 364-day TBs. The weighted average of rates of interest on government securities has shot up from 11.90 per cent in 1994-95 to 13.70 per cent during the current year so far. But, in the current situation, when the inflation rate has receded from the last years' levels and has been ruling below two-digit now for some period, and when the slack season liquidity easiness is quite distinct, the reductions effected in the discount rates on TBs or in the yield rates on dated securities are indeed niggardly

Open Market Operations

The Reserve Bank mopped up Rs 410 crore through its open market operations during August. However, it had to purchase Rs 36 crore worth securities from the market. The net OMOs thus were worth Rs 374 crore. The price list that the Reserve Bank of India issues for its open market operations have no longer remained a mere instrument to influence liquidity in the market, they also seem to have been surrogating as indicators of interest rates movement in the government securities market.

III
New Issues of other Money Market Instruments

Certificates of Deposit

Though the secondary market activities for CDs were almost dormant, the primary market was bristling with hectic placements of CDs, mostly by financial institutions with high

lending targets who were unable to raise resources through regular bond issues. As a result, the beginning of the month saw firming up of CD rates to around 16.5 per cent. However, they fell to around 14.5 per cent in sympathy with downward movement of call money rates. Earlier, the interest rates offered on CDs issued by the financial institutions went up to a range of 13-15.75 per cent in July 1995 from 11 per cent in March 1994. The outstanding amount of CDs issued by the financial institutions as on July 7, 1995 was Rs 2,959 crore, roughly the same as it was in March 1995, but those issued by the scheduled commercial banks as on June 9, 1995 showed a rapid rise from Rs 5,571 crore in March 1994 to Rs 8,017 crore in March 1995 and further to Rs 11,214 crore in June 1995 (equivalent to 3.2 per cent of aggregate deposits). With the easing of liquidity during July-August, banks have not been active in the CD market.

Commercial Paper

The activities in the CP market, both primary and secondary, have started picking up substantially. New CPs worth of about Rs 406 crore were marked for floatation in August the largest being Rs 300 crore issued by SBI Capital Markets. The primary CP rates moved downward from 14.5 per cent at the beginning of the month to 13.5 per cent in mid-August before stabilising in the range of 13.75-14 per cent reflecting easy liquidity in the market. The peak level of outstanding of CP had once reached Rs 4,511 crore as on August 31, 1994 but following the withdrawal in October 1994 of standby arrangement facility to banks in their cash credit limits for large borrowers and the stringent money market conditions, the CP outstandings dropped to Rs 581.50 crore as on July 31, 1995.

PSU Bonds

Major PSUs are likely to raise Rs 6,000 crore from the market in the next couple of months at high rates of interest. With the successful oversubscription for the SCICI's Rs 125 crore bond issue and improved money market liquidity, primary issues of PSU bonds received an impetus. While Power Grid Corporation successfully raised Rs 134 crore from the market in August, Steel Authority of India's issue worth Rs 400 crore was in the market with confidence that it will be oversubscribed like the Power Grid's and SCICI's. Power Grid issued a five-year paper at 16.25 per cent with exit option at three years. The Tourism Finance Corporation of India has issued bonds to private sector provident funds at a coupon rate of 15.5 per cent; they have already subscribed to bonds worth Rs 23.29 crore. These bonds are payable annually and redeemable at par after five years but they carry a put and call option at the end of three years.

The Indian Railways Finance Corporation (IRFC) was planning to privately place an issue of Rs 290 crore at a tax-free coupon rate of 10.5 per cent. The National Hydro-Electric Corporation (10-year tax-free bond of Rs 200 crore at 10.5 per cent), Mahanagar Telephone Nigam (MTNL) (Rs 284 crore at 16.5 per cent), and Rural Electrification Corporation (REC) were also reported to have firmed up plans to launch their debt offerings. The returns offered by them are as high as 16.25-16.50 per cent. It was, therefore, not surprising that MTNL's effort to place its debt issue at 15 per cent initially had failed.

IFCI (Rs 200 crore with a five-year instrument offering 15.5 per cent) and ICICI were also on the verge of launching their debt issues. It was reported that given the expensive returns for private placement, many PSUs were also considering making public offers. ICICI was planning a public issue of non-convertible debentures worth Rs 500 crore with an option to retain oversubscription up to Rs 500 crore at a rate of return of 15.5 per cent. Dena Bank is seriously considering the option of tapping the bonds market with an issue in order to meet its capital adequacy requirements. SBI is planning to float long-term bonds to fund its new thrust area – project financing; the aim is to access long-term resources to be deployed in the infrastructure portfolio which will be long-term assets and avoid the maturity mismatch.

Interestingly, for the first time the RBI allowed NRI and overseas commercial bodies (OCB) investments in bonds. This is for the first time that such foreign investments have

@ Outstanding amounts are estimated for all weeks of August 1995.

been permitted in debt instruments. Though the RBI has specified that the amount raised from foreign investors will not form part of external commercial borrowings, implications of this decision on the external debt would be certainly worth watching.

Interestingly, some PSUs have also decided to follow the bid process in raising money. NHPC was planning to raise Rs 400 crore in September through two instruments. One would be tax-free bond aggregating Rs 200 crore and another Rs 200 crore would be raised by inviting bids from investors. IRFC too would tap the market for raising Rs 290 crore through the bid process.

Other New Instruments

Meanwhile, many loss-making state electricity boards (SEBs) were planning to adopt a novel method of selling their depreciation. SEBs in Andhra Pradesh, Madhya Pradesh, Rajasthan, Punjab and Himachal Pradesh were planning to raise Rs 725 crore through 100 per cent sale and lease-back transactions by the end of September. The cost of funds for these SEBs was reported to be ranging from 7 to 10 per cent. Since the loss-making SEBs do not have to pay income tax, they do not need depreciation and as such would sell their equipment to a finance company, get hard cash and take the equipment back through lease. The finance company, on the other hand, would get the depreciation benefit and also income from the lease deal. Kotak Mahindra, ITC Bhadrachalam, Videocon Leasing, Pennar Paterson, Apple Finance, Ceat Financial, Pioneer Investment and Delhi-based WGF Securities, have already tied up with the SEBs of Andhra Pradesh, Madhya Pradesh, Rajasthan and Punjab. Between October 1994 and March 31, 1995 SEBs of Rajasthan, Karnataka and Andhra Pradesh had raised Rs 550 crore through the same route.

Citibank and HDFC were planning to list their securitised paper on the National Stock Exchange (NSE). Both the institutions had securitised a part of their portfolios almost three years ago. In the absence of a secondary market, however, the papers did not trade. Listing of these papers will encourage trading of this instrument in the secondary market.

With difficult secondary market conditions affecting the performance of its scrip which got listed in August, ONGC was planning to attach warrants with its proposed new issue for raising Rs 1,000 crore.

Kotak Mahindra was also planning to launch a debt issue with an exit option. The five-year non-convertible debenture for raising Rs 100 crore will offer an interest of 17 per cent; the issue will be launched in October.

ICD Market

The inter-corporate deposit market continued to be haunted by the recent failure of one large corporate house to repay the ICDs of Rs 200 crore. Despite easy liquidity in the money market, the panic in this market where the borrowings are unsecured, has caused the drying up of easy money. Although there were reports that Shaw Wallace had drawn up a contingency plan to liquidate more than 50 per cent of the company's unsecured debt, the market did not seem to have been reassured. As a result, corporates are insisting on collateralising ICDs with liquid money market instruments, preferably with US-64. The net impact was seen in the firming up of ICD rates up to 17-28 per cent level from the earlier level of 17-24 per cent. This prompted some companies to borrow from financial institutions and banks, and onlend as ICDs at around 24 per cent with a clean spread of 6-9 per cent; the latter go to satisfy the capital requirements of those companies which are mostly denied credit by banks. And the financial institutions and banks express their inability to detect rotation of borrowed funds for such short duration ICDs. Further, many companies have approached the government for increasing their ICD exposure limit as they have reached the threshold of investing 30 per cent of their free reserves and surpluses in subsidiaries and other companies. Meanwhile, there were reports that in order to bring some confidence in this market NBFCs were resorting to convert ready-forwards in Unit-64 to raise short-term liquidity.

IV
Call Money Market

The rates in the call money market remained in double digits but stable during most of the working days in August. (Tables 5 and 6). Even though the cash reserve requirements of banks increased following sudden improvement in the growth of deposits, the call money market was spared of any sudden shock and volatility due to return flow of food credit and government-borrowed funds. Further, adequate lending throughout by SBI and UTI put a constant downward pressure on call rates. As a result, call rates hardly could penetrate the upward psychological barrier of 11.0 per cent during the month – the rate of 11 per cent being the export credit refinance rate. The occasional spurts of call rates touching 11.5 per cent and 12 per cent were occasioned by the ensuing holidays and the stringency in the foreign exchange market. Thus, this level of rates despite an easing of the liquidity position in the money market was mainly on account of the pressure on the rupee in the foreign exchange market. Due to a sharp pick up in imports and because of dollar purchases for possible repayment of the non-IMF debt by the authorities, the rupee dipped to Rs 32.10 to a dollar during the second half of the month – close to the all-time low of Rs 32.15 on March 3 following speculation of a full rupee convertibility on capital account and imminent devaluation.

Also, it appears that the Reserve Bank's disciplining move taken last January of requiring banks to maintain on a daily basis an average of 85 per cent of their CRR requirement is beginning to have some impact. Even in tight liquidity conditions, the market has not seen sharp swings in the rates. Earlier, the holidays used to cause turmoil

in the market as banks were unable to get the data on their net demand and time liabilities from the branches across the country. August which had one bank holiday each week, did not see any turmoil in the market around those holidays except for some unavoidable skirmishes arising from having to cover for CRR in less number of days (Graph A)

The first week in August opened at rates of 6.5-7 00 per cent as in the previous week and they continued to be stable in the subsequent weeks. The rates remained at low levels during the third week of August, it being a reporting week The rates firmed up slightly on August 14 on account of the holiday on the next day. They, however, came down to 7 per cent on August 17 The three-year paper auction did not create much ripple in the call market as there was virtually no cash outflow with the Rs 2,000 crore outflow being matched by an equal amount of cash inflow on account of redemption of 364-day TBs to the tune of Rs 2,220.00 crore. In the penultimate week of the month, the call rates stayed between 10 50-11 25 per cent with a cash inflow of Rs 1,900 crore worth of 364-day TBs expected into the system on September 1

Forex Market

The foreign exchange market witnessed a flurry of activity during August The buying pressure on the dollar following a surge in imports and oil payments was reported to be the major causes for the slide in the rupee which continued throughout the month State Bank remained a major buyer of dollar during the month. From Rs 31 3950 to a dollar at the beginning of the month, the rupee was quoted at as low as 32.10 towards the end of the month.

Despite depreciation of rupee, the forward market remained partially insulated, with forward premia moving mostly downward (Graph B) which was also evident from the fact that spot dollar was available at a discount to cash dollar (see Current Statistics, *EPW*, September 2, 1995) which is contrary to the normal market practice The fall in forward premia could be most proximately attributed to increased liquidity in the money market. With call rates remaining lower, the swapping of FCNR deposits by banks and foreign lines of credit with forward dollar had come down to a skeleton level as the arbitrage benefits thinned down considerably, if in fact almost vanished as the cost of swapping touched 14 to 16 per cent whereas domestic calls were available at 11 to 12 per cent. Incidentally, the authorities' decision to route all non-IMF debt repayments through the market has, given the government's overall reserves and given the RBI's intervention policy, implications for domestic liquidity in the banking system; it tends to augment domestic liquidity

Secondary Market in Debt Instruments

Government Securities

As the month progressed, the secondary market prices of Government securities started improving, reflecting stability of call rates and in turn, adequate liquidity in the market Even so, the traded volume during the month was lower (Rs 1,995.65 crore) than that of the preceding month (Rs 2,136.39 crore) (see Appendix Table) Like the earlier trend, much of the activities were confined to converted securities. Further, the number of regular securities traded came down from 12 in July to only 6 in August. Among the converted securities, the short-term securities, namely, 12 per cent 1995, 12.75 per cent 1996, and 12 per cent 1999, were preferred by the investors, reflecting some uncertainty in regard to long-term interest rates. Among the regular securities, 14 per cent 2005 (II) stock attracted the largest trading during the month. A notable development pertains to the improvement in the trading activities in zero coupon bond, 1999.

Yield Curves

With some degree of stability observed in short-term interest rates, considerable normalcy has been restored to the behaviour of yield curves for government paper in August It is so whether we look at the curve for a single day in the month with maximum transactions which represents the real yield curve (Graph C) or at its surrogates in the form of weighted average rates for the last week of the month (Graph D) or those for the entire month (Graph E).

Other Instruments

Though the trading volume in PSU bonds remained buoyant in the secondary market, the selling pressure dominated throughout for both tax-free and taxable bonds, though relatively more for tax-free bonds as against that for taxable bonds in the preceding month. Further, the market interest shifted to tax-free bonds as the trading volume of tax-free bonds at Rs 81 65 crore was higher than that of taxable bonds at Rs 77 01 crore (Table 7).

(-) means no trading YTM = Yield to maturity in percentage per annum CY = Current yield in per cent per annum * Yield rates of these sub-groups of TBS and dated securities have been used for the graphs.

Notes: 1) Yields are weighted yields, weighted by the amounts of each transaction. 2) Current yield has not been worked out for treasury bills.

STCI Operations

Even though handicapped by low equity base and limits on single transaction, STCI has been actively involved in the secondary market by offering two-way quotes for popular securities – price quotes for government stock and yield quotes for treasury bills. As a vehicle of monetary policy, STCI mostly quotes offer rates higher than the market rates but its bid rates were largely unattractive which have probably engendered a mismatch of assets and liabilities for the institution which has already begun functioning as a primary dealer.

NSE Operations

The secondary market for government securities on the National Stock Exchange (NSE) was largely subdued during the first week of August. The traded volume during the week was Rs 252.53 crore (Table 7) with the government securities being most active followed by treasury bills. Commercial papers of SAIL, Finolex Cables were traded in significant volumes. Bonds of IDBI and ICICI were also active on the NSE screen. Interestingly, freshly-issued 364-day TBs began to be traded on NSE on the day following their issue on a few occasions.

[Statistical compilations and graphs for this note have been done by V P Prashant; Paramita Debnath has prepared background notes on private debt instruments and money market rates.]

COMMENTARY

Labour, Get Lost

A Late-Capitalist Manifesto

Jan Breman

The World Bank's capitalist manifesto in the form of the World Development Report 1995 *devoted to the theme of 'Workers in an Integrating World' exaggerates, distorts, selects or avoids information and, every now and then, does not shy away from disinformation.*

KARL MARX wrote *Das Kapital* less than a century and a half ago, inspired by the urge to serve the interests of the working class. Arguing from the opposite perspective, and motivated by the final breakdown of the socialist economies, capital has decreed how labour should behave if it is to attain a better future. The World Bank published its capitalist manifesto in a recent report, 'Workers in an Integrating World' (*World Development Report 1995*). While for Marx the emancipation of labour was the leading principle, the development trajectory suggested by the World Bank seems to take the unconditional and permanent surrender of labour to capital as its point of departure. Such triumphalist terminology is avoided, of course. Transition to a fully liberated market economy, we are told, is the best guarantee for sustained economic growth which will also benefit the working man. Reconstructing the global economy on a new and viable footing is a painful process, the more so because of the strongly protectionist nature of state-directed development policies that have upset the natural rhythm of market forces for most of the short 20th century.

The World Bank has no problem in acknowledging that the poor in particular have suffered, and continue to suffer, from structural adjustment. In terms of labour standards, this remedial plan of action involved dismantling a wide range of public regulations and provisions, causing wage cuts, unemployment and recession. In low-income countries unskilled labour is the most vulnerable social class, women even more so than men. The World Bank claims, however, that drastic restructuring in the balance of power in favour of capital is and continues to be a precondition for economic recovery. According to the Bank, however, it should be remembered that the pain borne by the poor was caused by failed strategies during the so-called development decades and is not due to any faulty design of the reform policy now in place.

The essence of this statement is arguable, to say the least. I have read the World Bank report and wrote this review while on an academic tour through the Caribbean region, which ended with a short halt at the University of the West Indies in Jamaica. That country's experiences are of particular interest because, as a recent study points out [Le Franc 1994], Jamaica was targeted by the World Bank at an early stage. It was one of the first countries in which structural adjustment programmes were implemented and in which loan conditionality was particularly harsh. Various contributors to the report conclude that the overall impact has been seriously negative and that social and economic costs have been excessively high. More crucially, and contrary to the outcome predicted by the World Bank, they deny that any noticeable improvement has so far materialised in the poverty-stricken conditions of most people as a consequence of the externally imposed structural change process. The authors of this critical assessment, nevertheless, concede that the downward growth trends of the 1970s and 1980s have been reversed.

> More specifically, demand has been deflated, the size and functions of the public sector have been reduced and redefined, more liberalised market mechanisms have been put in place, the division of the national income between labour and capital has shifted in favour of the latter, the structure of the labour force has changed, and there has even been increased levels of employment [Le Franc 1994:xii].

Unfortunately, while growth rates have increased, so also have net transfers out of the economy. In addition, over the adjustment period, people falling below the poverty line have increased in number: in 1992 an estimated 34 per cent of Jamaica's population lived in absolute poverty. I shall have occasion to return to the important conclusions in this single-country study in more detail later.

Growing Unequality

First, a few basic facts from the *World Development Report 1995*. The strength of this policy document is in the presentation of a huge amount of factual data as tables in the text, followed by an appendix on international labour statistics and an extensive overview of world development indicators. Although questionable in several respects, the information provided and the way in which it is presented is doubtless very useful to all who feel a need to discuss the labour issue within the setting of a competitive globalised economy. The report is also welcome because of its strong focus on the impact on labour of two distinct global trends of which the World Bank itself is a principal promoter: (a) reduced government intervention in markets and (b) increased integration of trade and capital flows which are accompanied by exchange of information and technology. The prime significance of the report is its analysis of the labour question in a truly global framework, not only going beyond the level of the nation-state but also relating rural to urban labour, formal to informal sector employment and work conditions across all spheres of economic life. This inter-sectoral and worldwide approach allows the World Bank to make meaningful comparisons between living standards of Vietnamese peasants, street traders and factory labourers, with those of waitresses and industrial workers in France. Or, to give another example, to explain how and why the earnings of bus drivers in Seoul, Bogotá, Jakarta, Bombay and Nairobi were more similar 35 years ago than they are today.

Of the 2.5 billion men, women and children who constitute the world's labour force at the present time, 1.4 billion live in poor countries, defined as having an average income per capita of less than US $ 695 (in 1993). More than a billion individuals have to make do with one dollar or less a day. The global army in search of work is going to grow in the next three decades by another 1.2 billion, a massive increase that will be concentrated almost exclusively outside the already developed part of the world. By the year 2000 only a tiny minority, according to the Bank's estimates, less than 10 per cent of all workers, will not be integrated in the global market.

One of the gains of sustained economic growth is a decrease in labour time: today's high-income industrial countries have recorded an almost 40 per cent decline in hours worked per person per year, from an average of 2,690 in 1900 to 1,630 in 1986. However, only a small minority has thus benefited. Today, 80 per cent of all industrial employees in the world live in poor- and middle-income countries. Such figures indicate the drastic shift that has occurred in recent times in the occupational composition, spread and workload of the labour force at the global level.

The good news is that, mainly because of increased productivity, the average worker is better off, sometimes much better off, than a generation ago. The greatest successes have been achieved in east Asia, where gross domestic product per worker more than tripled between 1965 and 1993. South Asia too, where labour productivity doubled over

the same period, has not done at all badly. Growth combined with progressive incorporation into the global economy, according to the World Bank gospel, is the prescribed remedy for poverty alleviation. A decade from now, as a result of the Uruguay Round Agreement, the purchasing power of wages will have risen in all major regions of the world except Africa. ASEAN and China are trend-setters, but south Asia is also expected to do better than either the EEC, Japan or North America.

At the same time, there can be no guarantee that the poorest workers will experience a rise in living standards. The other side of the success story is that the already existing inequality has sharply accelerated. In 1870 the average income per capita of the richest countries was 11 times that of the poorest; that ratio rose to 38 in 1960 and to 52 in 1985. This divergent relationship between growth performance and the initial level of income per capita applies not only in those extreme cases but is empirically valid on average over a sample of 117 countries. Statistical analyses of growth in income per capita confirm the importance of differences in initial levels: countries that were richer at the start grew faster. The Bank further spells out how, in the transition to a market regime, an increase in inequality may be not only unavoidable but indeed desirable. For such economies in the process of rehabilitation a widening of earlier established disparities is required in order to function efficiently.

Management of Poverty Alleviation

How can the poor catch up with the part of mankind that is much better off? First and foremost, they should not insist on a repooling of economic resources. The World Bank warns that it would not be very realistic to expect a major redistribution of capital. Altering the division of assets may be – in what could be a slip of the pen, the report on one page actually says *is* – crucial to breaking circles of poverty and reducing income inequality. A case can be made for large-scale land reforms in order to increase production and economic efficiency, but such major reforms are not easily accomplished. Large redistributions of land (or other forms of capital), the World Bank points out, have seldom occurred except in times of great political upheaval. And if a more equal division of property rights appears on the agenda at all, so the advice goes, the former owners must be compensated for their loss of stock. Land reform is best executed within a market framework, with willing buyers and sellers, rather than through expropriation. It is clear that in the professed scenario a drastic restructuring of resources between rich and poor is given rather low priority even at the national level, evidently for the sake of economic stability. At the global level such a shift in the distribution of capital merits no discussion whatsoever. If not these, then what changes are desirable and acceptable from the Bank's point of view?

The report puts much faith in upgrading the economic value of labour.

> An easier way to reduce poverty and increase equality of incomes is to change the distribution of human capital. Unlike with physical capital or land, this can be done by adding to the existing stock rather than through redistribution. Investing in the *human* capital of the poor, through primary health care and education, has been an important part of successful strategies of poverty alleviation. (p 42)

To that extent, governments can and should play an active role in facilitating access to what, in the Bank's notebook, are still demarcated as basic public services. What I find remarkable in the report is that while labour is persistently labelled as human capital, capital seems never to qualify as the product of human labour.

The proposed policy basically implies giving up on poor adults and investing instead in the next generation as the best strategy by which to improve the quality of life for the majority of mankind. In other words, policies aimed at reaching the children of those left behind are more likely to be effective. Breaking inter-generational cycles of poverty means giving children access to opportunities that have bypassed their parents. The key is therefore to invest in the human capital of these children. Education alone is usually not enough, however; it is also necessary to upgrade their physical quality. Better health, nutrition and education undoubtedly have value in their own right, enabling people to lead more fulfilling lives. As far as the World Bank is concerned, however, this is not the only or main reason why free public provision of these basic goods should be tolerated for relieving the plight of poor labour. Better nutrition and health will improve children's capacity while in primary school and, consequently, increase their productivity at work when they are older. Therefore, governments should ensure above all that the children of disadvantaged households do not remain entrapped in poverty but instead are given the chance to realise their economic potential. At an elementary level only, of course. With regard to most other human resources programmes the Bank sees no justification for free provision.

Accepting the economistic bias of this logic, if only for the sake of argument, it would be justified to mistrust even the modest pledges on the provision of social welfare made by the World Bank in view of what happened under the structural adjustment regime for example in Jamaica. The study mentioned earlier has this to say on the gratification of prime social needs.

> With regard to the supply of basic foods, the pursuit of SA meant the removal of price controls and subsidies, while in health it meant fee-for-service and escalating drug prices. In education, it meant over-crowding, deterioration of physical facilities, and declining performance... Between 1977 and 1987, expenditure on primary education declined in real terms by 30 per cent. [Le Franc 1994:42, 46]

Let us assume for a moment that the Bank is indeed willing to reconsider the harsh adjustment policies that were pushed so aggressively for many years and to mend its ways by genuine commitment to a mini-packet of social welfare. This would at least give the children of the poor access to elementary schooling and primary health care. But then comes the next question, which is whether the provision of these social goods is anything more than a mere marginal improvement in the life and work chances of the poor in an integrated and highly competitive global economy. After all, the trend towards growing inequality is also discernible in the ever-widening gap between educational and medical standards which so markedly distinguishes the lifestyle of the rich from that of the poor. To put it more succinctly, adaptation of the Bank's favoured strategy for remedial action hardly deserves to be called a significant breakthrough in the race of the poor to catch up with the richer Joneses at home and in the world at large.

Imperative Need for Labour Market Flexibility

Today, half of the world's workers are still self-employed or work in family enterprises, typically a farm. In the course of economic growth combined with sectoral diversification, employment in agriculture is declining, job opportunities in services and industries are expanding, and workers move to urban areas and from the informal to the formal sector. This is the upshot of a long development story in a nutshell. The World Bank steadfastly repeats the conventional wisdom of self-employed peasants in agriculture who first become waged labourers in the lower echelons of the urban economy, earn some income and learn skills, save, and ultimately again set up an independent business. My own extensive research on the urban informal sector has shown not much evidence, at least not on any large scale, of such upward mobility. In my opinion, it is a myth inspired by wishful thinking.

In low-income countries only about 15 per cent, in middle-income countries 45 per cent, of the total workforce earn a living in the formal economy. In high-income countries, the proportion of such labour is much larger, excluding only a small minority from employment in wage-paying, non-agricultural private firms and the public sector. The discrepancy reflects the differential way in which labour has become incorporated in the global economy.

Studies of rural labour markets in developing countries show a dominance of

implicit, i e, informal, labour contracts. Adhering to the moral economy school of thought, the World Bank report claims that in poor villages wages may be set at a level that ensures that workers have enough to eat in order to work effectively. More generally, wages will be set for a given task for the season, and considerations of what is fair may apply. I find it difficult to accept this statement without further qualification. In the course of my own research on the past and present state of agricultural labour in India, I have had occasion to comment time and again on such notions of 'fairness' imposed by employers. Exploitative labour practices are not an expression that belongs to Bank jargon. The bias against such phrasing explains why jobbers, important figures in the landscape of migratory and informal sector labour, are depicted not as ruthless operators selling their catch to the highest bidder, but as efficient brokers who smooth the contact between demand and supply.

> They contract with farmers, act as employment agencies, and contribute to the flow of information across labour markets of neighbouring regions (p 26)

With rising income per capita and an increasing rate of industrialisation, informal work arrangements and small-scale production become less useful The transformation is accompanied by a progressive switch to formalised contracts between employers and employees. Traditional systems of reward, based on piece-rates and task work, disappear and are replaced by more regular wages, a payment modality which workers obviously value for the security it offers.

The wording used suggests that the World Bank approves of the trend towards the formalisation of labour contracts. As a consequence, one would expect concern about a turn of events which signals stagnating growth of modern sector employment in many poor countries, as well as in those with higher per capita incomes, from the 1980s onwards. The earlier impression stands to be corrected, however, in view of the strong plea made a few pages later for doing away with most if not all regulations that provide protection to formal sector workers. Policies that favour the formation of small groups of workers in high-productivity activities lead to dualism and tend to close the formal sector to broader influences from the labour market, at the cost of growth in employment.

> In many Latin American, South Asian, and Middle Eastern countries, labour laws establish *onerous* job security regulations, rendering hiring decisions practically irreversible; and the system of worker representation and dispute resolution is subject to often unpredictable government decision making, adding uncertainty to firms' estimates of future labour costs (p 34; emphasis added).

It goes without saying that all these sins of commission and omission against healthy market practices have to be strictly avoided. But should not a transition to formal work arrangements – specifically: tenured employment, regularised wages and social security provisions – be applauded as a major step forward in working class lives for which the labour movement in countries all over the world has tenaciously, and by and large successfully, fought in the ongoing transition to capitalism? The Bank scorns rather than sympathises with the opinion that this is, indeed, the route to be further pursued. It is here, however, that signals become confused. On the one hand the report says that a shift to a less distorted and more formalised labour market can function as an equalising mechanism. A few lines later another statement insists that formal labour markets are often distorted and biased against the poor

What ultimately becomes clear is that future prospects for workers in the global economy can only be bright if they are prepared to behave with maximal flexibility, i e, to forego most forms of security and protection. After a balancing act, summing up the well known pros and cons, the verdict is that minimum wages are difficult to justify, particularly in low- and middle-income countries The same applies to most other gains, often the outcome of long-lasting struggles, which mainly if not solely benefit that segment of the labour force which is relatively better skilled and organised. The message is abrupt, short and clear: the privileged treatment enjoyed by formal sector workers should be abolished in order to put an end to the obnoxious state of labour market dualism Has not experience taught that capital, forced by the need for continuous economic adaptability in the rapidly changing world economy, is only interested in flexible work contracts? Well, labour had better fall into line. Dictated by highly volatile market conditions, this means the acceptance of casual rather than permanent employment, of fluctuating instead of steady wage rewards, of variable contrary to stable hours and fixed length of workday. Last but not least, workers should make little claims or none at all to secondary labour rights. In expressing a preference for such a work regime, the World Bank goes to the extent of even rejecting as untenable, both in principle and practice, the introduction of safety regulations at the site of employment.

> Needy workers in those countries often are not reached by protective labour legislation. They benefit from public action that attempts to improve the working environment in the rural and informal sectors – for example, through the provision of drinking water, improved sanitary condition, or eradication of infectious diseases (p 78).

Reflecting on the miserable plight of labour in the city of Surat, the location of my urban fieldwork in west India and a bulwark of informal capitalism which has witnessed pogrom and plague in quick succession during the last few years, I find this statement in the World Bank document to be intolerably naive and quite objectionable.[1]

Empowerment

Empowerment does not really belong to the Bank's articles of faith The line taken in the report is that underutilisation of labour, sometimes aggravated by bouts of open unemployment, is the main cause of poverty, rather than that this state of deprivation in which so many workers have to live could be attributed to far too low wages which find their origin in highly uneven market power. Along the same lines of logic, rising real wages can be very risky since they motivate employers to adopt labour-saving techniques. The systematic concern with job creation rather than with the need to raise rewards for labour, also explains why the Bank's *gurus* are not charmed with the idea of linking labour standards with multilateral trade or lending agreements. Their pontifical reasoning, not really backed up by substantial evidence, is that the costs of such a linkage would outweigh its benefits. More in general, there has been an overkill of all kinds of international convention that either make little sense or which cannot be put into practice.

> Countries have adopted various ILO conventions and have set a wide range of workplace standards, whose implementation the ILO has monitored. But most low- and middle-income countries are unable to enforce all the standards that they have introduced in their legal systems And in many cases the standards are set too high – at levels more appropriate for a rich country – that even if implemented they could have untoward effects on employment and economic growth (p 78).

It seems that, as far as the World Bank is concerned, the ILO might as well close-up shop.

The report grants that labour market outcomes are sometimes inequitable due to discrimination, for example against women or ethnic groups, or to the exploitation of vulnerable categories such as young children. What can be done about such unfair practices? Very often not much, it seems. Indeed, public action can help to accelerate change by pushing to improve the human endowments of those who are worse off and by acting to reduce discrimination. Together with this recommendation, however, comes the warning that tackling the problems of those left out is a formidable challenge for policy, in industrial as well as in developing countries.

> Investment in these individuals often has a low return, either because they are old and have few years of work left, or because they lack the basic skills necessary to function in a work environment, or because they are stuck in backward regions (p 46).

In plain language, the Bank's advice is to give up on such cases. In other words, to

write off the adults as a lost generation and to give the highest priority instead to investment in children, since "their health, nutrition, and basic education are the foundation of a nation's future" (p 40).

With regard to child labour, the report points out that in many instances this is not really very harmful, particularly if children are used as unpaid helpers in a family business such as a farm. Furthermore, e g, in India, children of poor households are sent out to work because the parents badly need the extra money. National legislation and international conventions banning child labour cannot deliver results unless accompanied by measures to shift the balance of incentives towards education. Programmes that provide income security for the poor such as food-for-work or other public work schemes, are helpful in reducing child labour. But again, the Bank falls back on the more orthodox solution by concluding that once poverty decreases and education improves, child labour will decline. This in turn will facilitate the enforcement of legislated bans starting with such universally abhorred forms of child labour as prostitution and hazardous work.

How should we react to the economic victimisation of women and minorities? Standards designed to protect women from job discrimination are often difficult to enforce. Insisting on equal remuneration for work of equal value has proved problematic even in industrial societies, and is a virtual impossibility for many low- and middle-income countries with limited expertise and resources. At the same time,

> Governments should not give up efforts to end discrimination in the workplace But the focus of those efforts will need to change, with greater emphasis on policies to improve women's access to modern sector jobs – for example, through merit-based hiring of more women in the public sector (p.74).

One is tempted to ask, firstly, why only in the public sector and not in the much larger private sector as well? Secondly, why should gender discrimination in the informal sector, where such practices are both more extensive and intense, be allowed to continue without legal sanction?

The Bank takes a rather non-committal stance in reporting on the success of policies designed to end or at least reduce ethnic and religious discrimination in the labour market. The experience of the US as well as India is briefly summed-up with the comment that the impact of affirmative action is still being debated, but that such schemes are usually too costly and difficult to implement in the private sector

Empowerment is not an altogether dirty word in the labour manual of the World Bank. To begin with, there is the firm declaration that free trade unions are a cornerstone of any effective system of industrial relations. They can help raise work productivity and reduce workplace discrimination. The report adds that some unions have contributed significantly to the political and social development of their country. Solidarity in Poland under communist leadership and the black labour movement in its fight against South Africa's apartheid regime are referred to as cases in point. This magnanimous observation, however, is followed by a more critical evaluation of their negative economic effects.

> Unions do often act as monopolists, improving wages and working conditions for their members at the expense of capital holders, consumers and non-union (unorganised) labour. The higher wages unions win for their members either reduce business profits or get passed on to consumers in the form of higher prices. Either result leads unionised firms to hire fewer workers, increasing the supply of labour to the unorganised sector and depressing wages there (p 80)

Also bad, at least from the Bank's perspective, is that trade unions have sometimes wielded their political power against structural adjustment Latin America has a long history of opposition to adjustment policies from that corner India is also singled out as a country where the labour movement, which mainly caters for the small portion of workers in the formal sector, continues to be sharply critical of the government's recent liberalisation efforts, despite the apparent success of many of these initiatives since 1991. Nevertheless, trade unions can and do make positive contributions to economic growth and equity, and policy-makers should encourage them to do so.

A most meaningful conclusion is that denial of the workers' right to organisation has proven not to be necessary to the achievement of income growth. In fact, the report warns that banning free unions may even be counter-productive in economic terms because governments may then feel obliged to introduce minimum wage legislation in order to circumvent pressure for independent unions, as the Indonesian government has done I read this statement with a good deal of surprise. Anyone who is even faintly familiar with the oppressive and exploitative labour climate prevalent in Indonesia knows all too well that minimum wages are set at the lowest possible level, far below the cost of living. Moreover, employers have nothing to worry about in the case of non-payment of even that small amount.

Free trade unions are thus indeed made welcome by the Bank as long as they behave properly and responsibly. Negotiations at the enterprise level are praised as the most appropriate framework in which to achieve positive economic effects.

> Where unions cover only a small portion of the workforce, as they do in most low- and middle-income countries, decentralised bargaining under conditions of competitive output markets produces the best results. This precept has long applied in Japan and Hong Kong and applies now in Chile and Korea (p 6).

In reaction to this statement, my query is: best results for whom? Under normal circumstances the World Bank seems to be little in favour of national trade unions. How the countervailing power of both organised and unorganised labour can be built-up at the international level in the ongoing process of economic globalisation, is an issue that is not raised at all. Once more, one wonders if the Bank's agenda has made the ILO an agency which is obsolete.

Footloose Capital and Labour

The globalisation of financial markets means gains for private capital. But what the report wants to know is how it has affected workers such as Joe, Maria and Xiao Zhi. Rich countries are scared that an alliance between capital and cheap labour in developing countries will lower wages and living standards at home. Alternatively, poorer countries fear exploitation – that capital will come only when wages are low and will leave again when wages rise. The industrialised societies have always used the lion's share of global savings. Average capital per worker is $ 13,000 in developing countries and $ 1,50,000 in industrial countries, close to 12 times as much. For most developing countries the share of foreign flows in investment is small, ranging from 20 per cent for low-income (mostly in the form of debt) and 5 per cent for middle-income countries. Overall, the transfer of financial resources from rich to poor countries has only played a moderate role in complementing domestic saving in developing countries In recent years, however, private capital has been flowing towards developing countries at record levels. Of course, it also may flow back again, as demonstrated by the sudden reverse in the case of Mexico. Such drifts are and should be beyond the purview of the state. In the considered opinion of the World Bank, capital flight is a fact of life for governments as well as workers. The underlying message is that both parties had better react prudently in coming to terms with the volatile motions of this prime production factor which, after all, is more scarce and powerful than labour.

It is not really a big surprise to read that the Bank is well disposed towards multinational corporations, which are looked upon as major and benign vehicles for promoting the globalisation process. No doubt, there are risks involved.

> ..many developing countries fear that increased competition for funds by other developing countries will lead to a rise in footloose investments, prone to leave at the slightest shock and unlikely to establish strong links with the rest of the economy (p 62).

However, to restrict trade or capital is not an effective method of dealing with this problem. A better strategy for any country is to improve the skills of its people or to ease their transition to new jobs, while staying

engaged with the world economy. A policy of taxing multinational corporations, in an attempt to keep low-skilled jobs from migrating to developing countries, would be equally counter-productive. In other words, capital knows best when, where and how to invest It should be left alone as much as possible in its restless search for the highest returns. To leave capital unharnessed in its erratic flows around the world will also bring maximal gains for labour, if not directly then certainly ultimately.

Should also labour, like capital, be allowed to migrate wherever it wants to go? The Bank agrees that at first glance, the case for free labour mobility seems as compelling from an economic standpoint as the case for free trade On second thoughts, however, the issue turns out to be more complicated The overall effect of international migration is, undeniably, much smaller than that of trade or capital flows. The quantity of people on the move is often exaggerated. A mere two per cent of people born in low- or middle-income countries live elsewhere than in their country of origin. On average there is not more than one emigrant per thousand inhabitants. At the same time, the number of sending and receiving nations has increased – at least 125 million people now live outside their country of origin Most emigrants, however, do not leave home for destinations faraway but tend to stay within their own region. More than half the global flows of migrants now occur between developing countries

As the report emphasises, greater labour mobility is important for overcoming regional imbalances To begin with, it makes economic sense for the migrants themselves. Spatial mobility is frequently a rational response to better chances perceived elsewhere, in terms of job opportunities and/or higher incomes There is, however, another side to the story which makes the World Bank agree with policies that block the spontaneous movement of people, even though they act in line with the idealtypical behaviour ascribed to the *homo economicus* This is because of the social and political friction created by transnational migration

> The pervasiveness of international poverty and falling transportation and communications costs mean that free labour mobility could lead to large immigrations to rich countries (p 67)

So this is where the hitch lies According to the World Bank, the threat of social unrest and increasing xenophobia justifies restrictions to the massive movement of people, to high-income countries in particular A solution suggested for this problem would be to prohibit the entry of immigrants for indefinite time periods One way to discourage the attachment of newcomers to the host country (and their urge to bring dependents as well), is to follow the example of several countries who stimulate the rotation of migrants by setting a prohibitively high price on the renewal of a work permit.

I find this line of argumentation flawed on several counts. Firstly, intra-national labour migration frequently causes the same type of friction that has become increasingly associated with the flight of 'economic refugees' to more prosperous zones elswhere in the world. It is clear, however, that the Bank would never dream to argue in favour of controls on the quality or quantity of people moving around in their own country in search of work and a better life in general. Secondly, the social and political dislocations created by the free flight of capital can be just as sharp as when people start to drift away, if not more so Why should governments only restrain the influx of that type of capital which is called human and not the exodus of financial capital? The report's observation that capital crosses borders more easily than labour indicates a policy bias that is actively endorsed by the World Bank.

A Regime of *Laissez-Faire*?

The Bank stoutly denies that the labour policies that it would like to see in operation bear the orthodox stamp of *laissez-faire, laissez-aller* When all is said and done, government intervention should ideally be limited to public action which supports the efficient functioning of markets and encourages productive investment As I have remarked earlier, the report is extremely cautious on how to deal with uneven market power and pays little more than lip-service to the needs of major categories of workers who are discriminated against or disadvantaged in other ways.

This conclusion also applies to the important social question, i e, how to cope with people's insecurity or lack of income Without bothering much about nuances, let alone assess more systematically the abundantly available evidence, the Bank's policy document resolutely declares that in the past governments have failed to improve welfare through state action. The prime recommendation is to desist from all efforts in this direction for the major share of the global labour force which belongs to the informal sector economy The argument again used is that of undue favouritism shown to categories employed in the formal sector

> The allocation of government expenditures on social services is often biased against the poor, and especially against those in rural areas and lagging regions The result is usually a lack of adequate sewerage, roads, and health and school facilities to serve poor communities (p 47)

These problems of uneven development can be redressed most effectively by large-scale investment in public infrastructure. Non-wage benefits should in principle be avoided, and certainly not provided by the state, since they hinder labour mobility and the healthy operation of the unfettered market mechanism.

The report wants us to believe employer-workers relations in the informal sector are governed by a wide range of social customs and traditions which mitigate the insecurity of the working poor. Employers are said to continue wage payments during the slack season, to provide loans to workers who face unexpected expenses, to support older workers or those unable to work for health reasons. We are told that such informal commitments by employers, although not formally agreed upon in advance, are an important part of socially acceptable codes of conduct. I must have missed this important dimension in my research among the working poor in many and varied rural as well as urban locations. Or have I fallen victim, innocently or even willingly, to systematic misinformation? In answer to my persistent queries, these workers tended emphatically to deny practices of benevolent paternalism. A more plausible conclusion, to which I feel justified in view of the counter-evidence in support of my different interpretation, is that the Bank's report is authored by a team of economists who are much more sympathetic to the interests of capital than to those of labour.

It is not only the continued prevalence of patron-based support mechanisms which, from the World Bank's point of view, argue against the early introduction of a public safety net in order to ease life somewhat for the most vulnerable categories. Such public provisions are also deemed unnecessary because of the ties of solidarity said to exist among kinsmen The claim is made in a sweeping statement which shows an outrageous degree of ignorance about the lives of large segments of the working poor.

> Financial help from relatives remains the principal form of income support and redistribution in developing countries. The extended family system is an important way of providing extra income and security to individual workers and their immediate households. . Private transfers play an important insurance function in addition to reducing income inequality: they provide old age support and ameliorate the effects of disability, illness, and unemployment. In most developing countries, especially in rural areas, older generations rely on the young to supplement their income (p 87).

Public works programmess can complement private efforts to help the unemployed poor, provided that the recipients are willing to work for low wages and to go wherever such work is offered. The low wages act as a self-targeting mechanism since they will be accepted only by the truly needy. For the more privileged labour in the formal sector, governments of low- and middle-income countries with limited administrative capacity are advised to adopt schemes based on severance pay, naturally co-financed by the workers themselves, rather than to introduce unemployment insurance. Reading such directives one wonders if the World Bank

really comprehends that governments are not mere bureaucratic agencies but also, and in the first place, political bodies which have to come to terms with the demands of their electorates

Finally there is the problem of people who are unable to find employment, whether temporary or permanent As for the first category, until the moment of their reintegration into the labour market, public employment schemes can deliver poverty relief policies cost-effectively For those, however, who are unemployable not only now but forever again – perhaps due to old age or disability – the public transfer of cash or food may be required It goes without saying that these hand outs should also in these instances be complemented by reliance on the type of private support mechanisms which, according to the received wisdom of the World Bank are such an important feature of social life in traditional [which are those?] societies

On Balance

What does the immediate future look like for the working poor at the bottom of the global economy always assuming that this vast multitude is willing passively to accept the labour regime that is euphemistically said to have been formulated for their own good? According to World Bank calculations, the difference between rich and poor will be in the order of 50 1 by the year 2010 The implication is a drop to a level only marginally below the one reached about 10 years ago in 1985 Such a ratio gives little ground for exultation But even this outcome cannot be guaranteed The best-case prognosis comes accompanied with the warning that if poor countries do not pursue market based policies or if the trend of global integration should be halted by protectionism the inequality which has been growing rapidly during most of this century, will further escalate and reach a proportion in the near future of 70 1 In fact, the Bank document signals that this scenario may be more realistic than an early reversal followed by a strong spurt in the direction of greater equality

In both China and India, the two awakened Asian giants, labour policy is in need of drastic reform There is a particular need to speed up the transition process in China and Vietnam and on the Indian subcontinent countries where the bulk of today's poor are concentrated

> Each has a small group of workers who are relatively well paid and enjoy high job security and, especially in China, generous non wage benefits, but are stuck in activities that need to be restructured Regulation is excessive, and workers have substantial political power – manifested in south Asia in independent and highly politicised unions in China in the potential for industrial action Resistance to change could threaten the transition to an open economy and the integration of the domestic labour market (p 122)

Moreover, there is always the danger of backlash from the industrial countries in the wealthy part of the world, possibly linked with concerns over labour standards Further, there is the risk of rising competition from China, Vietnam and the countries of south Asia for the poorer members of the group of late industrial nations, and from central and eastern Europe for the richer members of the same club

In short, things may worsen before they eventually start to get better Behind this dismal prospect for the huge army of poor people the more well to-do part of working mankind living in developed countries receives a far more positive message, namely that they need not worry about any drastic fall in their living standards The gains they have made within the lifetime of a few generations are not likely to fade away or be reduced in future years, whether absolutely or relatively by any serious attempt to redistribute the cake of global wealth

During the next few decades at least the gap will remain What else could be expected in view of the manifold structural impediments often of long standing that poor people have to face in their desperate struggle to do better in future than in the past? The early stage of the globalisation process has been of crucial importance in building up economic disparities in the world

> Participation by the developing countries in the earlier globalisation of 1850 to 1900 was shallow and often based on unfavourable terms especially in Asia and Africa They exported exclusively primary products and capital flowed in mainly to support such enterprises to develop capacity in natural resource extraction and maintain the support of friendly governments (p 53)

Here we are talking of course although the words are carefully avoided, about colonialism and exploitation by colonial governments Readers of the report who are reasonably familiar with the modern economic history of Asian and African societies or for that matter in the Caribbean region will be amazed that the integration of these countries in the world economy under colonial rule is summed-up as a 'shallow' first round of globalisation Such casual phrasing is a telling comment on the lack of historical depth among the experts on whom the World Bank policy-makers rely for authoring their documents

The *World Development Report 1995* has a high ideological content To put it more crudely, it serves propaganda purposes and shows all the characteristic features of such publications It exaggerates, distorts, selects or avoids information, and every now and then does not shy back from disinformation Examples of the last type of misrepresentation include that wages of agricultural labourers in India rose by 70 per cent between 1970 and 1990, that in Indonesia growth has reduced inequality; that, *ceteris paribus*, dirty or risky work is likely to pay more A more fundamental objection to my mind is that some core issues are underplayed or in several instances even totally ignored

To give a few examples, there is scant discussion of the displacement of labour due to technological innovation The relevance of this topic can be derived from an incidental press flash in my own country reporting that, while profits for major Dutch business corporations have increased fabulously of late their record in terms of job creation is abominably poor Within the abundance of statistical data contained in the Bank report, one would search in vain for any clue to the changing quantum of labour cost in the overall production price of commodities that circulate in the world economy in different stages of processing And finally all information on the share of business profits going to respectively labour and capital is avoided like the plague

Marx's oeuvre on political economy has been criticised severely from the moment of publication and quite rightly so His ideas were dogmatic and reflected a heavily mechanistic view on the stages of economic growth which was moreover, unduly Eurocentric However the the World Bank's credo seems equally doctrinaire The differences in substance and style are too many to list, but one is that while Marx never disguised his *parti pris*, a prime source of inspiration for writing his work the leading Bank in the business of globalisation makes believe that its labour catechism is an objective and even handed appraisal on how the working poor in the world can be redeemed from their life of misery That is a sophism

The World Bank's black and white thinking which colours both its policy analysis and recommendations is illustrated by the notion that the main task of government is to create a climate and environment that is conducive for capital to flourish i e to operate with maximum efficiency and efficacy There is nothing in the Bank's report on the background of capital and how it originates, on the social identity of its owners or what they want and why The rationality of capital is never questioned in principle A basic assumption of the World Bank seems to be that capital is willing to behave with political correctness in other words to act with social propriety and to adhere to policy directives that favour investment in productive activities which create employment No reference is made to speculation or to the role of black money and its impact on employment and labour relations far beyond the informal sector of the economy The international circulation of these huge amounts lacks transparency, of course, but that is no reason for remaining silent about these financial conduits and the way in which they impinge on labour conditions at the global level

The mantras of the Bank relating to employment and labour are ultra anti-statist. In defence of that virulently hostile bias, the report harps on the complete failure of socialist economies, particularly in eastern and central Europe, ending with their total collapse. Many points are well made. In its eagerness to drive the lesson home, however, the Bank goes overboard by clubbing together socialist state regimes and countries with mixed economies. Although in the eyes of the World Bank these are presumably tainted by the same disease – both having provided cradle-to-grave protection for their workers – the two cases should be distinguished as different political economic systems with past trajectories that were markedly divergent. The upshot of this observation is that the very substantial progress in the quality of the labouring existence in my own country over the last hundred years would not have come about without public intervention in the domain of private economy. The emancipation of the working class was accompanied by the harnessing of naked capitalism through social and political action promoted by social-democratic as well as christian-democratic ideologies. The outcome of this struggle in the Netherlands was a welfare state which, although now in the process of being slimmed down, still seems to have a viable future. The verdict of the World Bank that governments in the past failed to improve welfare through state action caricatures the track record of many nations in Europe and other parts of the world, and does not do justice to the testified success of redistribution of income through public policies.

Ending on a Disconsolate Note

The Bank has a poor reputation on equity and social justice. It is true that the report endorses greater political openness and democracy, but not so much as worthy goals in themselves, so it seems at least, but as useful means by which to increase economic efficiency and raise production. The other side to this is that, while authoritarian regimes do not face open opposition, democracies are held accountable but precisely for that reason often have difficulties of legitimacy in times of structural adjustment.

Labour market dualism is strongly rejected because the many benefits showered on formal sector labour, a privileged but small segment in low-income economies, are said to disqualify a large part of the working poor from striking a better deal. Informalisation, however, seems to me to be the wrong way of solving the inequity problem. The Bank actually replaces the dualism it fights with another policy dichotomy, that between capital and labour. In contrast to the first factor of production, which is allowed to insist on stability and security, workers are expected to behave with maximum flexibility which puts many of them into a state of extreme vulnerability. My conclusion is that the World Bank hides its political choices behind economic arguments which are given the status of natural laws.

A last question that comes to mind in this concluding part of my critique is whether most of the money flowing to state treasuries – a more modest amount anyway in view of the Bank's advice to tax capital lightly – will not be needed to maintain law and order. The situation that I encountered in the Jamaican capital during the summer of 1995 indicates what may represent a more general state of emergency throughout the world.

The new Kingston that has arisen is a location in which World Bank officials and their clients would immediately feel at home. This enclave consists of modern roads and stylish buildings in which hotels, embassies, banks, travel agencies, etc, run their global business. The air-conditioned shopping arcades have American-style eating places. In these multi-storied malls one can buy all the familiar brand names which everybody becomes familiar with during commercial breaks on foreign and local TV channels, dominated by the endless American soaps. Consumers are allowed to pay in Jamaican money but the US dollar has become standard currency as well in this milieu.

Only a short distance away, downtown Kingston with its slum settlements belongs to another world. A street vendor in the local Jubilee market could not even change the small note with which I tried to buy a few mangoes. Helmeted soldiers patrol the streets, armed with action-ready rifles to quell the private wars fought between criminal gangs. The visible state power intensifies the grim atmosphere which is felt rather than seen. Aliens, a category which includes foreign tourists but also members of the capital's growing 'middle class', are advised to stay away from this troubled zone. Political parties recruit *Lumpen* in this locale to do their dirty work. A stark naked man, evidently mentally disturbed, wanders around in the streets. His wild gesticulations and shouts are ignored by all who pass him by. On the corner I try to avoid looking at a small demonstration of violence. A boy is surrounded by two helmeted soldiers who threaten to beat him with the butts of their rifles.

My impressions walking the streets of Kingston are confirmed in the review which I quoted earlier on the Jamaican experience with structural adjustment policies. Two contributors to this collection of essays portray the losers as follows.

> They were seen in the increased number of homeless and mentally ill searching through the garbage containers, they were absorbed among the numbers of youth recruited into criminal posse, they were included among the fixed income pensioners whose private property could not be relieved by food stamps, they were numbered among those who stood grimly in visa lines, and they were found among those whose incomes were increasingly inadequate for the purchase of basic food requirements (Anderson and Witter in Le Franc 1994:52).

What is missing in the Bank report is discussion on the dignity of labour in its own right, and on the need to safeguard the quality of social life in the ongoing process of global integration. The World Bank seems to be much more concerned about dualism in the labour market than about the growing bifurcation between the haves and have-nots caused by the type of policies it prescribes. Such a trend towards polarisation is bound to end by a division of people at the national as well as the global level, into two segments: the included and excluded. At the end of the introductory overview the report briefly considers this frightening spiral:

> Indeed, there are risks that workers in poorer countries will fall further behind, as lower investment and educational attainment widen disparities. Some workers, especially in Sub-Saharan Africa, could become increasingly marginalised. And those left out of the general prosperity in countries that are enjoying growth could suffer permanent losses, setting in motion inter-generational cycles of neglect (p 8)

That this is no hypothetical scenario becomes clear when, much later in the report, the observation is made that countries which are initially poor tend to invest less and to have less educated populations. The circle is thus closed. Poor countries tend to grow more slowly than richer countries in spite of the (small) advantages conferred by backwardness, because their very poverty does not allow them to invest in human and physical capital to the same extent as the richer countries. How can that conclusion be combined with the document's major recommendation that tells governments not to bother about redistribution of income or resources but instead to concentrate on investment in health and education for their children?

The policies outlined by the World Bank reflect more than mere technocratic pragmatism. It is an approach that leans towards social darwinism dressed up in a new jargon which is more polished than the earlier variety some hundred years ago. The Bank takes sides and, contrary to what it claims, not in favour of the poor populations who will continue to make up a very large part of mankind in the 21st century.

Note

1 See for more detail Breman (forthcoming, 1996). This monograph is the outcome of my research in recent years on the dynamics of informal sector labour in urban and rural south Gujarat

Revenue Village vs Real Village

Under-Enumeration and Non-Enumeration under Srisailam Project

: Ramachandraiah

By blindly following certain concepts such as that of 'revenue village', the Census exercise has in certain areas resulted in under-enumeration and non-enumeration. In areas affected by the Srisailam project in Andhra Pradesh, for instance, entire villages have been left out.

BROUGHT out as a joint venture of state and central governments, the District Census Hand Book (DCHB) is one of the important Census publications especially in the context of the planning and development at grass roots level. It is the most important, rather the only, source that provides village level information for several demographic and socio-economic characteristics. Ever since 1951 when the 'village statements' were replaced by the DCHBs, certain improvements have also been made in the content and depth of information presented in successive censuses. Thus in 1981, exhaustive information has been incorporated to meet the needs of not only "micro-level and local area planning for rural areas" but also "to meet the Minimum Needs and Revised Minimum Needs Programme of the Planning Commission". The purpose was also to "help [in] regulating the provision of goods and services and also to enable minimising regional imbalances in the process of development".

The Census has adopted a village as the smallest unit and this village follows, though not necessarily, the revenue village which has definite surveyed boundaries and is recognised by the district administration. The village may or may not have hamlets but these hamlets are situated within the area of the village. One may infer that even if there are hamlets, what appears in the Census is the name of the (revenue) village. Here lies the problem. The concept of revenue village was introduced by the British as the lowest administrative unit in the settlement hierarchy for revenue collection and not for any local level planning and development. If one has to examine various dimensions of development at village level, there is no way one can know about hamlets through the DCHBs. Some of the hamlets are quite significant in size and are, sometimes, as big as the main village itself.

The DCHBs have not been published for 1991; the data are available in floppy-diskettes. We make an attempt to compare the population figures of some of the displaced villages between 1981 (prior to displacement) and 1991 under the Srisailam project in Andhra Pradesh. The population figures for 1991 have also been obtained from the local Mandal offices for comparison with the Census data of 1991 to assess the differences. The feasibility of the Census adopting 'revenue village' in providing data to be useful for micro-level planning and development is also discussed. The analysis is confined to Kurnool district because of the easy availability of data at the micro-level.

More than a lakh of people were displaced, rather forcefully evicted, in May 1981 in Kurnool and Mahabubnagar districts under the Srisailam project in Andhra Pradesh. About 82 villages were submerged accounting for more than 21,000 dwelling units. Another 35 villages lost part of agricultural lands. The government of Andhra Pradesh did not have any rehabilitation policy other than paying cash compensation. The compensation paid to lands was only one-fourth to one-fifth of their market values. Similarly compensation paid for houses was also much less compared

Notes: * Includes subdivisions and hamlets. Figures are based on the data obtained from the mandal offices.
The hamlet Vanamalapadu under Prathakota has divided into two (Table 1).

to what the construction of a similar new house would have cost. Neither the government identify new sites in advance for resettlement.

The way the people were displaced and compensated under Srisailam project will go down as one of the darkest chapters in the history of major dams in India. People had to identify new sites and resettle on their own. In the process, a number of poor people from many villages settled in far away places in search of livelihood. A few settlements have completely disintegrated in the sense that they could not resettle at one place and retain the original village identity. One such village is Sangameswaram, near the confluence of Bhavanasi with Krishna (which already has waters of five rivers within it) and known as Sapta Nadi Sangam. It had a famous temple visited by thousands on Mahasivarathri day. The 'lingam' in the temple is made of wood and is known to have been consecrated by Dharmaraja, the Pandava chief. Another consequence of displacement is the divisin of settlements Broadly, intense factionalism in Kurnool district and nearness to the unsubmerged lands in Mahabubnagar district were the main reasons for such a division. Some of the villages also have resettled at one place thus forming a larger village (Table 1). Nehrunagar has emerged as a big village but the old village names are retained in their respective localities with a distinct identity. Displaced people from several far-off villages have also settled here. Of the five old villages that make up Nehrunagar, two are revenue villages, Veerapuram and Murvakonda. Thus the settlement pattern has undergone considerable change in the aftermath of displacement For any purposeful micro-level planning and development, it is imperative that these changes are taken into account and the population figures are recorded correctly.

One may notice serious discrepancies in the population figures of these settlements in 1991 between those obtained from the Census and mandal offices (Table 2). The census figures are expected to take into account the hamlets also. In all the hamlets and component villages mentioned in Table 2, a number of schemes like IRDP, DWCRA, JRY, etc, are under implementation at considerable investment. Field work data from these displaced villages suggest that the mandal figures are closer to reality. Incidentally, these figures have also been provided by the Census authorities as per the views expressed by the concerned officials at mandal level. If so, why such discrepancies? The hamlets of Prathakota are located quite far away whereas the two subdivisions are close-by on either side of the K C canal. Of the component villages of Nehrunagar, only Murvakonda appears in the Census and its population does not tally with the total figure. Despite the two subdivisions, Ganapuram and Gummadapuram appear as single villages in the Census The hamlet Pothulapadu is the place where the head regulator for Srisailam Right Branch Main Canal (SRMC) is located which in turn would supply water to Telugu Ganga Srisailam Right Branch Canal (SRBC) and partly augment K C canal waters In view of these significant changes in the settlement pattern, it is difficult to understand how the Census figures (of 1991) would provide a basis for development programmes of the Planning Commission and enable in "minimising regional imbalances in the process of development"

That the Census authorities at the local level have blindly followed the concept of 'revenue village' becomes evident further if one looks into Tables 3 and 4. Four revenue villages lost all the land and two more in a very high proportion This also highlights the extent of submergence. All the four villages, whose lands were completely submerged, along with another village, are reported to be 'un-inhabited' villages in the 1991 Census (Table 4). The fact that these villages have been resettled (displaced) was lost sight of. Palamarri and Beeravolu are located very close to the mandal headquarters. These villages are reduced in size drastically because people have left for other places to settle down in the aftermath of displacement. Because of the lands were totally submerged, they cease to exist as revenue villages but what about the people who have resettled? A number of schemes are under implementation in these villages also fortunately because they are visible and mandal offices have the population records. This amounts to non-enumeration of villages themselves in the Census while Table 2 discussed earlier refers to under-enumeration. The villages in Table 4 may continue to be reported as 'un-inhabited' unless corrective steps are taken by the Census. Steps also need to be taken to ensure that the enumerators do not strictly adhere to the concept of 'revenue village' to the detriment of other villages.

Such under-enumeration is not confined to the displaced villages. The fact that several hamlets do not appear in 1981 (prior to displacement) suggests that there is something seriously wrong in the methodology adopted by the Census in identifying villages and hamlets. What is the borderline of population between these two units? It may be interesting to examine this problem over wider areas. Inclusion of all settlements at least up to the minimum population of 50 in the Census is imperative if the data are to be used for any meaningful planning at local level. What is important in the context of planning is the settlement, a practical and real entity, with its population rather than under whose revenue jurisdiction it is located. The aggregate figures available for a village can sometimes be misleading in the absence of information for hamlets. Delimitation of boundaries for all small settlements will pose some difficulties. To overcome this problem, hamlets may be listed for each village while providing information, and only the location and boundary of the village may be depicted on the map (as is the practice now). The DCHBs may become slightly bigger in size with the inclusion of hamlets but the exercise will serve the purpose better than that at present. This is required in the larger interests of providing comprehensive data base for micro-level planning and rural development.

TABLE 3. LAND SUBMERGED UNDER REVENUE VILLAGES IN PAGIDYALA MANDAL, KURNOOL DISTRICT

Name of the the Revenue Village	Total Geographical Area before Submergence (Acres)	Land Submerged (Acres)	Per Cent of Submergence
Prathakota	6533 99	5728 79	87.66
Muchchumarri	5363 19	1431 19	26.69
Murvakonda	6555 37	5130 37	78.26
Palamarri	1518 69	1518.69	100.00

Practice of Pedagogy in Non-Formal Education

Anjan Ghosh

In the context of the present din over Total Literacy, a small effort, discussed here, at putting into practice a critical pedagogy shows our pedagogues how to stop canting and start acting.

MUCH discussion and debate has focused on alternative pedagogy in non-formal education across the world. The quest for alternative pedagogy has spanned Paulo Friere's Brazilian experiment with the 'pedagogy of the oppressed', Sylvia Ashton Warner's 'organic teaching' among the Maoris in New Zealand, to the Italian school at Barbiana. Yet how far has this rubbed off on the practice of non-formal education in India? A slim but attractively produced two-part primer in Bengali, *Mojar Para Lekhar Khela* by Sandip Bandopadhyaya, sponsored and published by Unnayan, a social action group from Calcutta, affords us an opportunity to reflect on the practice of pedagogy in non-formal education here.

Written specifically for the 6-14 year old children of Unnayan's non-formal education centres located in the fringes of the city, the primer evolved through a participatory research process whereby the author initially tried out his lessons with the children in the above centres before including them in the primer. Children's suggestions and responses were kept in mind before the lessons were given final form. Often their responses were included verbatim in the text

Most of the children in the education centres were from poor families living in the slums and 'jhopris' (squatter settlements) in the eastern part of the city. Their parents worked as drivers of van rickshaws, peddlers as well as maid servants. Many of the children also worked in the small workshops or tea stalls and hence could not attend regular schools. The non-formal education centres were for them a window to the world.

The primer seeks to build on the children's experiences. It does not consider the children to be completely uneducated or assume a 'tabula rasa'. By according value to their experiences, using their words and experiences, as well as incorporating aspects of their everyday experiences, the primer seeks to avoid either talking down to the learners or preaching to them. Proceeding in an open-ended manner by questioning their own situation, the primer seeks to organise, link and supplement their pre-existing information in a way that the children can begin to comprehend their own predicaments. A lesson on water in Part II illustrates the *modus operandi*.

The lesson opens by asking what does it mean to be thirsty and proceeds by incorporating two actual responses. A girl says, 'when I am thirsty my insides seem to be parched'. Another boy adds, 'without drinking water we cannot survive. Water is another name for life.' These then lead to a discussion on the sources of water like tap, well tubewell, pond, canal, river and ocean. After querying their relative familiarity with these different sources, it quizzes them on its differential availability in rural and urban situations It asks where their water supply comes from. Moving on to note how clean drinking water is more often available to people in urban areas than in the villages, it continues by pointing out that in the city people living in houses have greater access to it than those living in the slums and squatter settlements. Is this the reason why the people in the latter suffer every year from gastro-enteric ailments? After explaining how the presence of bacteria makes water unclean, it asks why is it that everybody does not get access to clean drinking water? Isn't the availability of clean drinking water a basic right? The lesson concludes by reminding the children the recipe for rehydration as an antidote to gastro-enteric illnesses.

Clearly, the lesson proceeds by questioning the familiar environment while introducing learners to logical reasoning and the rudiments of scientific method. Significantly, it does not assume a homogeneity of experience between the learners and their instructors, nor does it gloss over the contradictions and inequalities of their social situation.

The primer has several other distinctive features. Keeping in mind Saussure's proposition that the word is an arbitrary sign, the author does not standardise linguistic usage. To retain the vibrancy of their language he uses their non-standard expressions. For instance, a little girl says that after she returns from school she does not play with her infant brother but "gives play (things) to him"! In the primer alphabets are not enumerated separately from words. It is through the words that they learn the alphabets as well as learn to draw shapes and familiarise themselves with numbers. But this means that the learners do not learn the alphabets or numbers in sequence. This could prove to be an impediment to sequential cognition.

By including folk-tales and myths, it seeks to encourage the imaginative capacity of a child while eschewing moralisms and religious instructions. It is the body which is the principal referent of the self. And the self is located in specific social and economic environments. In a background note on the writing of the primer, the author sums up his own ideas on education:

> Education, we believe, does not mean loading a child's mind with ideas from above. To 'educate' is to help children feel, question and judge the things going on around them. It is to activate a child's cognitive ability and sensitise him/her to the various contradictions that characterise society. Children, thus educated, learn to challenge the unjust systems and take up action for their change. We offer no solution, no recipe; we refuse to look upon learners as empty vessels to be filled in with chunks of 'knowledge'. Our aim is to lead them to critical and creative thinking so that they may act/intervene to change their conditions of living.

Even if this is an over-optimistic evaluation of the role of cognition, there is little gainsaying its positive outlook. The primer is not filled with esoteric knowledge which alienates, but works with the learners in sustaining and nurturing their curiosity and critical spirit.

In the context of the present din over Total Literacy, this small effort at putting into practice a critical pedagogy may remain another insignificant alternative. But it surely shows our pedagogues how to stop canting and start acting!

Social Development Summit

Abdication by UN

Ninan Koshy

At the World Social Development Summit in Copenhagen the United Nations legitimised the role usurped by the Bretton Woods institutions, thus giving up its own powers and functions in the economic field mandated by the Charter.

WHILE the ostensible objective of the World Social Development Summit was to address urgently 'profound social problems specially poverty, unemployment and social exclusion that affect every country' and 'to launch a new era of international co-operation between governments and between peoples', it was actually part of a process to redefine and restructure the United Nations to suit the interests of the west, particularly the US, in the post-cold war era.

At Copenhagen, the United Nations legitimised the role usurped by the Bretton Woods institutions (BWIs) thus giving up its own powers and functions in the economic field mandated by the Charter. It sanctified the political philosophy of the World Bank and the International Monetary Fund. The member states of the UN by the commitments made at the summit undertook substantially less obligations than they are legally bound under the International Covenant on Economic, Social and Cultural Rights. The demolition of the UNCTAD is followed by the shots fired at the ILO through the World Trade Organisation.

The credibility of the ten commitments is considerably weakened by the record of the states which made them. The varying degrees of emphasis of different commitments cannot go unnoticed. In some cases it is 'commitment to goals', in some others it is 'commitment to promoting the goal' and yet others speak of commitment to 'promoting and attaining the goals'. Some goals are well-defined, some others are processes or just frameworks. The uneven nature of the commitments finds reflection in the imbalance in dealing with various issues in the programme of action.

The Covenant and the Summit

The well-defined goals in the commitments are eradication of poverty, full employment and universal and equitable access to education and health. The International Covenant on Economic, Social and Cultural Rights encompasses all these social goals. The important distinction between the commitments and the covenant is that while the former are declarations of intention by governments, the latter is about rights of the people which the governments are legally bound to ensure. The summit showed that the UN is averse to the discourse of rights with regard to social development.

Article 2 of the covenant is of particular importance to a full understanding of the covenant and must be seen as being in dynamic relationship with all of the other provisions of the covenant. It describes the nature of the legal obligations undertaken by states parties to the covenant. These obligations include both what may be termed obligations of conduct and obligations of result. While the covenant provides for progressive realisation and acknowledges the constraints due to the limits of available resources, it also imposes various obligations which are of immediate effect. One of them is the undertaking to guarantee that relevant rights will be exercised without discrimination. The other is the undertaking in Article 2 (1) to take steps which in itself is not qualified or limited by other considerations. Such steps should be deliberate, concrete and targeted as clearly as possible towards meeting the obligations recognised by the covenant.

The UN Committee on Social, Economic and Cultural Rights "is of the view that a minimum core obligation to ensure the satisfaction of at the very least minimum essential levels of each of the rights is incumbent upon every state party. Thus, for example, a state party in which any significant number of individuals is deprived of essential foodstuffs, of essential primary health care, of basic shelter and housing or of the most basic form of education, is prima facie failing to discharge its obligations under the covenant" [Alston 1991:45]

It is the states parties to the covenant like India which have prima facie failed to discharge such obligations that want people to believe in their commitments at Copenhagen.

While it is sometimes argued that consensus has not been reached as what exactly one is entitled to according to the rights in the Covenant on Economic, Social and Cultural Rights, as Ramacharan stresses, there are at least two 'doors of entry' to the covenant. First, states parties are obliged to ensure that the rights enshrined in the covenant are promoted 'without discriminations'. Ramacharan argues that this guarantee is as firm as a legal obligation, raises an issue that is tangible as well as capable of legal supervision and could be made justiceable at the domestic level [Ramacharan 1990].

A second 'door of entry' hinges on subsistence rights which impose 'immediate' obligation on states and is the principal reason for including the right to food and freedom from hunger among the core rights. Article 1 (2) affirms that 'in no case may a people be deprived of its means of subsistence' It is governments which have failed to fulfil such treaty obligations that have now made 'commitments'

From the beginning, the UN has given a second class treatment to the Covenant on Economic, Social and Cultural Rights, notwithstanding its periodic and almost ritualistic reiteration that all human rights are universal, indivisible, interdependent and interrelated. The end of the cold war gave the west a new opportunity to reinforce the claim of primacy of civil and political rights. The Copenhagen summit has followed the line that what are in the Covenant on Economic, Social and Cultural Rights are not really rights but aspirations which the governments may fulfil when they choose.

If the governments were serious about their commitments then they should have made a commitment to ensure the ratification of the core human rights treaties, the International Convention Relating to the Protection of Migrant Workers and the relevant ILO convention, by all states by the year 2000. They should have recognised the legally binding obligations of the Covenant on Economic, Social and Cultural Rights and proposed an optional protocol giving recourse to individuals as is provided in the Optional Protocol of the Covenant on Civil and Political Rights.

As the Copenhagen Alternative Declaration signed by some 600 non-governmental organisations representing more than 8,000 groups around the world stated, "The economic framework adopted in the Draft documents is in basic contradiction to the objectives of equitable and sustainable social development. The over-reliance that the documents place on unaccountable open, free market forces as a basis for organising national and international economies aggravates rather than alleviates the current social crisis".

(Copenhagen Alternative Declaration, *Politiken Summit*, March 10, 1995).

BRETTON WOODS INSTITUTIONS

The document accepts as its basic programme structural adjustment policies at the national level. In spite of the refrain that people should be at the centre of development, free market is at the centre. The summit gave blessings to the political and economic philosophy which rose to prominence in the 1980s through the Bretton Woods institutions and came to be known as the Washington consensus. Its underlying assumptions include, (a) balance of payment deficits are *ipso facto* evidence of domestic mismanagement (fiscal deficits and 'distorting' government intervention); (b) economic agents will respond readily and positively to 'enlightened' price policies; (c) markets are inherently superior to government intervention in ensuring efficient resources allocation; (d) growth – and by implication development – should be private sector-led and is facilitated by a liberalised policy environment [Griesberger 1994:xii].

Major responsibility for the follow-up of the summit is given to the World Bank and IMF with the UN accepting their philosophy. The programme of action says, "The United Nations and the Bretton Woods institutions should establish regular and substantial dialogue including at the field level for more effective and efficient co-ordination of assistance for social development". The secretary-general of the UN in his 'An Agenda for Development' had already identified the Bretton Woods institutions as "important sources of development finance and policy advice" (p 42).

This may be the place to look at the status of the BWIs in the UN system. In the report referred to above the secretary general said, "The BWIs as specialised agencies are an integral part of the UN system" (p 42). Are they?

In September 1947, the General Assembly approved without a vote, the agreements between the UN and the IMF, and the UN and the World Bank as specialised agencies of the UN system. In fact, the agreements constituted a declaration of independence of the two financial organisations rather than one of co-operation with the UN. In the discussion on the agreement held in the Economic and Social Council (ECOSOC) of the UN in August 1957, the representatives of Norway, Soviet Union and Venezuela stated that ECOSOC would be departing from the provisions of the UN Charter if it approved the agreements. They pointed out that the conditions imposed by the BWIs did not permit them to be recognised as 'specialised agencies' of the UN.

As a former senior official of the UN, Erskine Childers, has pointed out, it is not the role of the BWIs to concern themselves with issues of macro-economic policies. Consideration of those matters is the function of ECOSOC and their adoption that of the General Assembly. He goes on to point out that according to Article 58 of the Charter the General Assembly should co-ordinate these policies and according to Article 63, ECOSOC should co-ordinate their implementation by the specialised agencies [Childers 1994:7]. This co-ordinating role of the ECOSOC was not recognised by the Copenhagen summit.

The Fund and the Bank are not in practical terms 'specialised agencies' of the UN system in accordance with the provisions of the Charter. They are simply the instruments of major powers and major capital [Teitelbaum 1994:33]. Since 1947 when the IMF and the World Bank officially became sepcialised agencies of the UN system, efforts to ensure that they co-ordinate their activities with ECOSOC have proved fruitless because the two instruments have refused to do so, insisting upon their independence. The Bank and the Fund participate actively in meetings of ECOSOC, but also in very many meetings of the various agencies of the UN system and the ILO. But there is no reciprocity. Neither the Fund nor the Bank receives members of these agencies on an equal basis.

While the Charter gives the ECOSOC the power 'to co-ordinate the activities of the specialised agencies', the summit could only say, "Consideration should be given to the possibility of holding joint meetings of the Council (ECOSOC) and the Development Committee of the World Bank and the International Monetary Fund". The summit has bestowed legitimacy upon the independent status usurped by the BWIs.

At present, representation of the UN in meetings of the Fund and the Bank has been confined to the annual meetings of the board of governors and the one-day meetings of the interim committee and development committee held twice a year. In recent years the representative of the secretary-general has been excluded from the private meetings of both committees. The secretary-general of the ILO said in his 1994 Report, "It (the ILO) has little influence in the deliberations and policy decisions of the institutions which play an increasingly important role in the management of the world economy" ('Defending Values, Promoting Change', International Labour Conference, 1994).

Apart from the differences among the states in the drafting stages of the documents of Copenhagen, there have been internal tensions and conflicts in the UN about the philosophy of the summit and the approaches to the issues. Some parts of the UN have been highly critical of the BWIs. Since the beginning of the 1980s the human rights organs of the UN have been concerned about the impact of human rights of policies and practices of major international financial institutions. This question has been addressed in particular by the Committee on Economic, Social and Cultural Rights and the Special Rapporteur of the Sub-Commission on Prevention of Discrimination and Protection of Minorities.

The programme of action of the summit speaks of "ensuring an adequate social safety net under structural adjustment programmes". It may be recalled that the UN working group on the Right to Development at its 1994 session drew attention to the danger of introducing 'social safety nets'. It pointed out that while these are aimed at mitigating the negative social effects of these programmes on disadvantaged groups they could – unless care is taken – become a substitute for global macro-economic policies. The concept of safety net treats people as secondary in development. Here development is synonymous with growth. Hence, the reorganisation of the UN and its serious implications deserve close security.

Peasant Movements and Empowerment of Rural Women

Debal K Singha Roy

Why do women need an extra space within the broad fold of a social movement for the articulation of their problems? Do all social movements provide the required space and the conditions for such an articulation.

ALTHOUGH the concept of 'women's empowerment' is of recent origin in feminist vocabulary, periodic efforts towards the empowerment of women may be as old as the history of collective protest or social resistance of human groups or communities. Women's struggle for empowerment of women may be latent or manifest, visible or invisible, symbolic or concrete depending on the socio-cultural context.

A social movement has been broadly perceived as an organised or collective effort to bring about changes in the thought, beliefs, value relationships and major institutions (including political) of society, and to establish a new social order [Blumer 1951; Toch 1965; Haberle 1951, 1972; Gusfield 1972; Wilson 1973]. Organised and intended collective actions are important aspects of social movements. These actions are based on defined aims, a methodology of collective mobilisation, a distinctive ideology and an identified leadership and organisation. For Rao (1987), collective mobilisations, ideology and orientation towards change are basic elements of a social movement.

The central thrust of the process of empowerment, on the other hand, is the dynamics of power. Power has widely been defined as one's capacity to influence or control others; if capacity is legitimised it becomes authority. According to Weber, there are three main bases for the legitimisation of power: traditional, rational-legal and charismatic. One group can have effective power to control others by having control over resources and ideology. Those who have power are those who control material and knowledge resources and the ideology which governs both public and private life, and are thus in a position to make decisions which benefit themselves. Hence, the process of gaining control over the self, ideology and the resources which determine power may be termed empowerment [Batliwala 1993:7].

Empowerment as a social process challenges the fundamental imbalances of power distribution and relations. It is a process of redistribution of power within and between families/societies; and a process aiming at social equality which can be achieved through disempowering some structures, systems and institutions [Banerjee 1992; cf Sharma 1992:28]. Empowerment, therefore, is a process aimed at changing the nature and direction of systemic forces which marginalise women and other disadvantaged sections in a given context. It is also visualised as an enabling process for disadvantaged sections [Sharma 1992:29]. Thus women's empowerment can be seen as a means of creating a social environment in which women can take decisions and make choices of their own, either individually or collectively, for social betterment. Since women occupy a disadvantaged position in society, the process of women's empowerment will also aid the empowerment of other disadvantaged sections of society. It would help men of lower socio-economic strata to liberate themselves from the clutches of traditional bondage, hierarchy and exploitation.

Social movements and empowerment are both social processes. Orientation towards change and identified ideology and strategies are the basic components of these processes, and both undergo a process of progression from self-assertion to collective mobilisation. However, collective mobilisation, leadership and identified organisation are the immediate requirements of a social movement. A social movement may cover various issues (social, economic, political) and may take diversified forms of collective mobilisation (radical and reformative) and resort to diverse ideologies. Empowerment also resorts to collective mobilisation, and gradually identified leadership and organisation emerge with distinctive ideological orientations of gender equality. Grass roots organisations for women's empowerment may be cited as examples. Thus in a given context, empowerment is also a variant of a self-conscious social movement.

Though the process of empowerment can achieve the status of a social movement in the process of its progression over a period of time, the scope of empowerment of women is also available in latent form in various social movements, especially in peasant and dalit movements. Although within the broad ideology, organisation and leadership structure of these movements the issue of women's empowerment does not get specific attention, these provide enormous space for the articulation of such issues. Such articulation is symbolic and manifested in the form and extent of participation of women in these movements; in the long run such space for articulation may give birth to autonomous women's empowerment movements.

Against this backdrop, the following questions may be raised for in-depth enquiry. Why do women need an extra space within the broad fold of a social movement for the articulation of their problems? Do all social movements provide the required space and the conditions for such an articulation? Do the required scope and condition of such articulation change along with change in the basic character of a movement? We shall examine these questions based on data collected on two villages of West Bengal-Khanpur (located in south Dinajpur district) and Shalgeria (located in Minapur district) - which experienced the Tebhaga movement in the late 1940s and the naxalite movement in the late 1960s, respectively, and grass roots political mobilisation in recent years.

Women and Social Movements

The social and economic roles of women in a peasant society are essentially structured by age-old traditions, beliefs, values, customs, and by the processes of education and socialisation. Such roles are gender-based, and gender largely determines the ways in which men and women participate in social interaction. In the process of such structuration and gender-role stereotyping, women are relegated to a lower social status. In a system in which resources and power have been concentrated through historical processes in the hands of a few, and the majority are landless or semi-landless, women of lower strata are doubly oppressed, first by being women (subjugated in the gender hierarchy), then by being members of the oppressed class (subjugated in the class hierarchy). Such concentration of resources and power has an enormous patriarchal bias in which women have no control over productive resources. They also have no control over knowledge, information and ideas and even over their bodies and selves, since their reproductive activities are determined by patriarchal expectations. In the power hierarchy they are relegated to marginality since they have

no say in decision-making processes, even decisions about themselves. The social and economic bases of marginalisation and oppression of women are legitimised by traditional norms, values, institutions and scriptures which provide the broad ideological foundations of patriarchy and casteism. The resourcelessness and powerlessness of women are widely recognised within the normative framework of society in India, including traditional literature and religious scriptures

Scholars [Rao 1989; Dhanagare 1976; Mukherjee 1979] have viewed peasant movements as a distinct variant of social movements and have endeavoured to analyse these in terms of their linkages with changes in the organisation of production and class conflict. Peasant movement has a specific connotation in the Indian context since farmers' movements have emerged as a different variety in recent years. At an operational level, a peasant movement may be defined as an organised and collective effort of the peasantry (subsistence and small producers, tenants, sharecroppers and agricultural labourers) to bring about change in the pattern of ownership, control and use of land, share of agricultural produce, wage structure, credit and institutional support system and in other aspects of socio-economic life that have subjugated them in agrarian society. The form and extent of the response of the disadvantaged sections and women towards a peasant movement largely depend on the nature of ideological orientation and the form of mass mobilisation, which play crucial roles in the dynamics of peasant movements. Peasant movements can broadly be categorised as 'radical' or 'reformative', depending on their particular combination with ideology, form of mass mobilisation, and orientation towards change. Radical movements are those that use non-institutional mass mobilisation, guided by an ideology of rapid change in the social structure. Though these movements are usually short-lived, they may spread over a large geographical area. A reformative peasant movement, in contrast, uses institutionalised mass mobilisation, is guided by an ideology of gradual social change, and tends to exhibit a longer life span. Peasant movements, however, are not discretely radical or reformative; rather one may be an extension of another over a period of time [Singha Roy 1992:21-23].

It is observed that radical peasant movements promise greater scope for empowerment of women by denying the norms, values and institutionalised bondage that legitimise the subordination and powerlessness of peasant women in rural society. The reformative peasant movements in the form of grass roots mobilisations, on the other hand, provide limited potential for women's empowerment since they accept the pre-existing institutional arrangements, norms and values of gender segregation and subordination in one form or the other.

Radical Peasant Movements

The peasant society of West Bengal has borne witness to the vehement outburst of numerous peasant movements in the 20th century. The most celebrated of these movements were the Tebhaga movement of 1946-47 and the naxalite peasant movement of 1967-71. One of the significant dimensions of these movements was the phenomenal participation of women at all stages.

Tebhaga (two-thirds share) was a movement by sharecroppers to retain a two-thirds share of the produce for themselves and thereby to reduce from one-half to one-third of the produce, the rent to be paid to the landowners (locally known as 'jotedars'). On the eve of the departure of the colonial power from the Indian subcontinent, agrarian society in India was highly stratified, characterised by extreme subinfeudation in landholding; a high degree of poverty, economic insecurity, and extra-economic coercion, and bridleless exploitation of the poor peasants, sharecroppers, tenants and agricultural labourers by the upper strata of the agrarian hierarchy. While the mounting pressure of indebtedness, unemployment and poverty increased among the lower strata of peasant households, the landowners kept on imposing more and more exploitative terms and conditions of work and tenure on the former. The situation became unbearable for the rural poor, a large number of whom were sharecroppers who lost their lands to the big landowners through distress sale They revolted against the injustice. This revolt took the form of an organised movement in the northern part of undivided Bengal and swiftly erupted all over the state The movement grew under the leadership of the Bengal Kisan Sabha and in the process of mobilisation, agricultural labourers, sharecroppers and poor peasants in the form of tenants of various categories became the driving force against the jotedars, zamindars, moneylenders, traders and the British bureaucracy. It was essentially an economic struggle, and the movement took a political form when it had to confront the jotedars, the political apparatus of the state [Desai 1979:419]. From the outset women of the lowest section of agrarian society were mobilised in the movement, and women's participation surpassed that of men after the latter were arrested and the struggle intensified [Basu 1981:221]. This movement witnessed a total and spontaneous participation of women in the struggle against the upper caste landowners-cum-usurers. The newfound enthusiasm touched even the most backward women of the village. Brave kisan women took the lead in propaganda work, and they often led the men in the fight facing the hirelings of the jotedars [Chakravarty 1980:87]. Women from the peasant and sharecropper households (belonging to the rajbansi, polia, mahato and colkamar castes and santal tribal groups) took an active part right from the initial stages of these movements by providing hospitality to the participants in secret meetings, giving shelter to underground activists and serving as the latter's communication network, forcefully harvesting the paddy in their own 'kholan' (courtyard), defying the landowners openly, and maintaining the alarm system by blowing conch shells and beating gongs and utensils. They also came to the forefront of the struggle brandishing traditional weapons and showed collective resistance by barricading the strong police force. Many women lost their lives in the northern part of Bengal in police firing. Again, when the movement went underground in the face of the oppressive measures of the state, women came forward to take care of the underground activists by supplying them with food and messages and taking care of their homes and dependents. They also organised self-defence against the attack of the landowners when their male members were underground.

Independent India adopted a progressive land reform policy to abolish the intermediary system of landholding, to distribute surplus vested lands among the landless and poor, to ensure the tenurial security of tenants and sharecroppers, and to increase the productivity of land. The state government of West Bengal also enacted radical land reform laws. However, the agrarian society of West Bengal witnessed a gap between land reform legislation and the implementation of the same in the absence of political commitment by the parties in power. The big landowners evaded the land reform laws by taking recourse to loopholes, and taking favours of the police and the administrative apparatus of the state. The economic insecurity, unemployment and poverty of the rural poor became rampant and increased tremendously. Exploitation of the peasantry in the form of extra-economic coercion, low wages, gender-based wage discrimination, low share of the produce, and termination of tenancy on sharecropping went on unabated. National Sample Survey reports show that sharecroppers, who constituted 16 per cent of rural households in 1954-55, were reduced to 2.9 per cent by 1961-62. The real income of rural households decreased tremendously and the food shortage situation in the state became alarming. The exploitative situation became unbearable. The cross-currents underneath of discontent amongst the rural poor were manifested in the outburst of the peasant movement in the Naxalbari region of West Bengal.

In May 1967 the peasant struggle and armed uprising in Naxalbari thana of Darjeeling district marked the emergence of a new era in peasant movements in India. This movement was initially launched by a breakaway group of the Darjeeling district committee of the CPI(M) under the broad Marxist-Leninist-Maoist ideological framework (widely known as naxalite ideology); it opted for mass struggle and seizure of power through guerrilla warfare. This breakaway group later formed the Communist Party of India-Marxist-Leninist [CPI(ML)] This uprising underwent a long drawn out struggle between the forces organised by the naxalites and the landowners-police combine. The movement spread like wildfire across the state and some areas, viz, Gopiballovpur and Debra thana of Midnapur district, became strongholds of the naxalites in the late-1960s. Women, especially of poor peasant, tenant, agricultural labourer and sharecropper households, mostly belonging to the scheduled castes and tribal groups, became the driving force of this movement They came out openly and actively participated in meetings and processions and in other forms of mobilisation and collective action, providing hospitality and shelter to underground activists and maintaining communication networks among them, forcefully appropriating crops from the lands, occupying land and other properties of big landowners, stopping eviction of sharecroppers, and foiling the attacks of police and landowners Many young women joined secret training in the 'red bases' for guerrilla warfare, and when the 'liberated zones' were declared in selected forest areas women were in the forefront of resistance against the police force and the landlords-usurers combine They were prepared to throw stones, hot water and dust mixed with chilli powder, and also to use bows and arrows, axes and other available traditional weapons to protect themselves Along with the men they took all possible measures to prevent the police and other government officials from entering the liberated villages. When men took shelter in the forest to evade arrest, women organised themselves to prevent police attack on them. Like in the Tebhaga movement, in this movement, too, women participated spontaneously and overwhelmingly

Why did women of the lower rungs of the social and economic hierarchy participate in these movements so overwhelmingly? Did they have a different realisation from that of men of the same socio-economic hierarchy? These questions can be answered in relation to the specific form and extent of women's oppression and the ideology of this oppression, on the one hand, and the ideology and form of mobilisation of the peasant movement that provided the space for women's liberation and empowerment, on the other.

Women's oppression and marginalisation are legitimised in a composite social situation. This situation is perpetuated by the traditional values of caste hierarchy and patriarchy and by the institutionalised norms and values of society. Traditionally, peasant women were assigned a lower status in society because of their lower caste background and participation in manual agricultural activities. They were called 'chotolok' or 'chasha' (rustic) women by the 'bhadralok' or 'babus' (big landowning-cum-higher caste people). Economic deprivation accentuated their social deprivation. Socio-cultural and economic factors were intregrally correlated with their seclusion, which in turn contributed to their political passivity. At the village level women were subjected to the dominant upper caste values, which perceived high caste women as 'grihalaxmi' (goddess of wealth of the house) – but not these peasant women the nature of whose work was considered derogatory and demeaning. Their activities and economic condition were justified in terms of the doctrine of 'karma' by upper caste landowning groups.

Patriarchal ideology dominated the social and economic life of these women and compelled them to accept the decisions made for them without their participation amd representation in the decision making processes Patriarchal behavioural norms and values imposed enormous restrictions on women's interactions, conditioning them to tolerate injustice silently and without any protest or resistance both in the family and in society. These values also contributed enormously to women's low access to information, the outside world, and productive resources, and to their increasing marginalisation. The important manifestations of their marginalisation were low wages, gender-based wage discrimination, unspecified work schedules, extra-economic coercion, non-recognition of their work potential, and their casualisation in the labour force.

In everyday life, together with male members of their groups, they experienced the end product of economic deprivation in terms of illiteracy, ill health, starvation, poverty and frustration. They suffered from landlessness, tenurial insecurity, indebtedness, extra-economic coercion by the landowner (in the form of ploughing the landowner's plot without reimbursement, making themselves available for service to the landlord, guarding the landlord's property without any remuneration, and working under the 'begar' system (work without wage, receiving only food) in the landowner's field during the peak seasons). Besides providing unpaid service they also had to maintain the conventions of social distance. They were not allowed to wear colourful clothes or even to use umbrellas or cycles in the presence of the landowners. They were to regard the landowner as 'annadata' (benefactor). They also were made to give false witness in courts of law in the interests of the landowners.

As their economic condition deteriorated, female agricultural workers emerged as a distinct category, at the end of the system of social and economic exploitation. They were to work only for the minimum wage, they were paid only half the wage of their male counterparts for the same type of work, they were to be present on all occasions as assured labour to maintain the tenurial security of their land. Women of poor peasant households who lost land because of poverty and distress sale, and women of sharecropper households who were evicted from the land because of the dissatisfaction of the landowners, joined the agricultural labour force as casual labourers accepting exploitative terms and conditions of work. Many of them were bound to a 'beck and call' relationship, taking loans from the landowners under the 'dadar' system They took advance loans in the lean seasons with the understanding that they would be obliged to work for the lender in the peak agricultural seasons at the lean season wage rate which was less than 50 per cent of the market rate.

Thus, they were to grind under the wheel of gender-based discrimination and subjugation. They were exploited economically, neglected socially, and politically they were a powerless group since they were neither organised nor had recognition in the political economy of the village Dominant caste values provided the broad normative framework for women's subjugation, and the ideology of patriarchy reinforced the social and economic marginalisation and political passivity of women.

Radical Peasant Movements and Women's Empowerment

In terms of ideology, form of mobilisation and orientation towards change, both the Tebhaga and the naxalite movements were radical peasant movements. These movements challenged the normative arrangement of society that legitimised the oppression and marginalisation of rural working class women. Though their ideologies did not focus entirely on matters concerning rural women, they gave them scope to articulate their own issues and to fight against gender-based social and economic injustice. They saw an opportunity not only to improve their economic lot but also to break loose from the bondage of the age-old normative structure of society and the control of patriarchy. In the radical process of mobilisation, it was for the first time that they stood side-by-side with men publicly and got a taste of equal responsibility and status. They quickly rose in relative

power both in the family and society. The accumulated gender-based latent discontents of these women were manifested in the form of their hostile and aggressive mobilisation against upper caste big landowners. For these toiling women, it was not simply a response to the exigencies of society – it was a response to the promise of an egalitarian society, to collective mobilisation which aimed to bring radical change in the old values, norms and institutions of their society.

These movements brought a qualitative change in their perceptions. While the men viewed their actions as an onslaught on the exploitative terms and conditions of work and an attempt to bring about a better condition of life, the women saw their own actions as being, in addition, a fervent attempt to sever the age-old societal and familial bondage and subjugation which they experienced as females. They found in their action an aspiration for equality both in the family and in society.

Some of the participants of the Tebhaga and naxalite movements have given voice to this insight. Fulo Kamaini, an illiterate widow of more than 60 years, narrates her experience of the Tebhaga movement

> As the movement started growing we were given more and more responsibilities – cooking food for the activists, providing facilities for the secret meetings, receiving and giving messages. Gradually the leaders started listening to us [women]. They started consulting us in most matters. We were given importance. We were invited. We came to the street ignoring all the 'prathas' (norms) standing side-by-side with men for the first time. We experienced a flood which washed away all the 'purano niyam canuns' (old traditions and customs) of society, the tortures of the landowners..

For Nagenbala, participant in the naxalite movement, the movement was

> a wildfire to burn all the old discriminatory customs, rules and systems. We participated in this movement to bring a new 'samaj babastha' (social order). Our struggle was not only against the class of landowners, but was also against the system. During the struggle we could deny the bondages which enslaved women in society. As we involved ourselves with the movement, new horizons of hope opened to us [Singha Roy 1992:126].

Grass Roots Mobilisation

The form and extent of collective mobilisation of the peasantry has changed significantly in West Bengal over the years. Radical non-institutionalised mass mobilisation has been replaced by institutionalised parliamentary party politics and grass roots mobilisation. The leftist political parties who once sponsored radicalism and militancy to mobilise the peasantry for collective action in the radical peasant movements are now concerned with institutionalised mass mobilisation and electoral politics. The United Left Front (an alliance of the leading left parties) government which came to power in 1977 has been advocating grass roots mobilisation for the rigorous implementation of land reform laws, for improving the economic conditions of the rural poor, and to eradicate the bases of extra-economic coercion. In this process of institutionalised grass roots mobilisation the form and extent of women's participation has been defined and directed within the institutionalised perspectives of the political parties, state and society.

At present the peasant movements in West Bengal have achieved reformative character. There has been a substantial shift in the ideological orientations of peasant movements. The leftist political parties CPI(M), CPI, RSP, CPI(ML) – Satya Narayan Sinha-Santosh Rana group under the orientation of 'ideological revisionism' have adopted tactics which opt for slower change. Such a process has helped to reinforce in one form or another the norms and institutions that either legitimise or promote marginalisation and deprivation of women. Indeed, the reform initiatives are symbolically wedded to a male-dominated social order.

Under these reformative activities elaborate arrangements are made for uninterrupted grass roots mobilisation (mobilisation of the landless labourers, sharecroppers, tenants, marginal cultivators and poor artisans) to provide tenurial security to the sharecroppers by registering their names under 'Operation Barga'; to distribute surplus vested lands among the landless and semi-landless; to provide institutional credits and other inputs to cultivators and assistance in the form of subsidies to poor peasants; arranging food for work programmes in the lean seasons of agricultural operations; etc. They also undertake various poverty alleviation and employment generation programmes under the Integrated Rural Development and other related programmes. The village panchayats, which are dominated by the left, have been given responsibility to carry out day-to-day mobilisation and to implement the decisions of the ULF government at the grass roots level. The women's wings of these political parties have also come forward to organise peasant women for collective mobilisation.

In the process of such mobilisation, though the class interest of the lowest section of agrarian society is well represented, women's issues and interests have remained widely neglected. It should be mentioned here that the class position of male and female workers are not always the same in the rural society, since they have different terms and conditions of work resulting from their diverse positions in the rural labour market. For example, gender-based wage discrimination in agriculture is a rule rather than an exception. Grass roots mobilisation has not been able to do away with this practice which is a product of patriarchal perception. Similarly, most surplus vested lands and institutional loans are allotted in the name of the male member of the household. A study conducted in four villages of West Bengal shows that of the 197 persons allotted surplus vested land only five are female, and only 4.5 per cent of institutional loans are granted in the name of a female. Recording of the tenure of sharecroppers, distribution of surplus vested lands and providing institutional loans in joint names or proportionately in the names of the male and female, could have been important instruments for socio-economic empowerment of peasant women. Though political parties have shown progressive attitudes in mobilising women, they have lacked the initiative to take concrete action for the empowerment of rural women, since class inequality has been the prime concern rather than gender disparity or women's empowerment.

Indeed, the ideology of contemporary grass roots mobilisation envisages very limited potential for women's empowerment. Following the tactical path of partial ideological modification and revisionism, the reformative peasant movement has been left with little scope to challenge the bondage of the normative structure, patriarchy, gender segregation and subsequent marginalisation. Selected norms and values of society have got wider recognition in these processes, in which the powerlessness of women is the traditional expectation. In these processes of mobilisation peasant women have been perceived as 'beneficiaries' of development schemes and not as 'change agents'. In the grass roots politics of poverty they have been subordinate to and dependent on rural political leaders who have accumulated power and wealth. Development initiatives are being implemented through emerging political leaders. In the face of persistent agricultural backwardness and in the absence of alternative avenues of employment a large section of peasant women tend to follow the immediately available political path for the elevation of their economic status. They want to be the recipients of surplus vested land, house plots, or subsidised loans, to be the beneficiaries of development schemes, work under food for work programmes, etc. Since resources are limited, there is always competition among the rural poor with a view to getting such benefits. One tries to widen the scope of getting these benefits through participation in political processes, viz, dharna, political meetings, processions, strikes, demonstrations and exercise of adult franchise according to the

desire of political leaders. The local political leaders are interested in increasing and strengthening their support bases through such political processes. In this process rural poor women become dependent on political leaders in order to become beneficiaries of development schemes. There have been frequent defections of leaders from one political party to another. Many of the ex-big landowners and local criminals have emerged as local political leaders in the new set-up, hence loyalty and dependency have been more personalised than ideological in nature. The expectations of a large section of rural women remain overshadowed. Maloti Kamarni, a 40-year-old scheduled caste woman of Khanpur village of South Dinajpur district makes a typical statement:

> We are made to be hungry dogs We run after dry bread Sometimes bread is thrown in front of us by the landowners, sometimes by the political leaders We run after everybody with our begging bowls but we find that nobody has given us sufficient bread to meet our hunger Rather we have lost our begging bowls who thinks about us? Even the party leaders do not realise the extent of our starvation, our problems We do not want our wage to be increased by 25 or 50 paise We want 'saman-saman majuri' (equal wage for equal work) and no wage variation by season. They [leaders] do not consult us before coming to an understanding with the landowners When they need us to vote, to join meetings, processions and gherao, they come to us, we follow them because we have no other options left. However, they do not care about our problems

Economic Development and Sanskritisation

The agrarian society of West Bengal has experienced diverse social processes. Peasant women are no longer a homogeneous category. Economic development, occupational diversification and education have helped elevate the economic status of a section of peasant women, which has led to their withdrawal from outdoor manual agricultural activities Though not total, there has been a considerable change in the outlook and life-style of these households In India legitimisation of the upward social mobility of lower castes is through the process of 'sanskritisation', whereby lower caste people emulate the life-style of upper castes. However, sanskritisation has a negative impact on the lives of women It immures them and changes the character of the husband-wife relationship, and leads to heightened sensitivity to ideas of purity and pollution [Srinivas 1978:16]. The process of sanskritisation, while imposing several restrictions on the behaviour, movement and work participation of women, explicitly or implicitly recognises the bridleless authority of men over women Thus sanskritisation leads to seclusion and relative circumscription of activities of women, and to patrilocal and dowry marriage. Gradually women have the worst of all worlds: "They do not have gender parity because of the strictures imposed by sanskritic status emulation, they do not have social respect because of their caste ritual status" [Berreman 1993:370]. Indeed, the upwardly mobile peasant women are in a status trap Though not in spirit, they emulate most of the outward cultural expressions of upper caste women. They are trapped, to be subjugated within the broad cultural fold of the 'bhadralok' – the cultural milieu of the upper caste landed or occupationally mobile gentry, in which women are supposed to remain ideally aloof from the domain of public life and accept the bondage of patriarchy for familial and social glorification, becoming submissive, sacrificing, sober, soft spoken and attentive to male members of the family

It has been indicated that peasant women are not a homogeneous category. While one section has been subjected to the dependency nexus as beneficiaries of development initiatives, and another group has been trapped in the conventional cultural milieu of the upper castes in the process of upward social mobility, still another group has emerged as highly socially significant – a thin layer of women political workers and activists. Though their numbers are not statistically significant, they have socially emerged as highly relevant as 'change agents' in rural society. They are a very dynamic and mobile social category. Some of them occupy even block level political party positions of women's wings of political parties Some have been village panchayat members very recently. However, their individual existence is usually short-lived in this layer since many of them retire from political activity either after getting a job or migrating to other places after marriage. However, these positions are filled in, though not immediately, by other aspirants. These peasant women are the product of a social milieu generated out of the persistent grass roots mobilisation in West Bengal since the late 1970s. Many of them are the relatives of local political leaders. Many have school level education and have been exposed to the outside world and to the mass media while attending meetings and processions in the district headquarters and state capital They have also acquired experience of

interaction with district and state level political leaders. Many of them are very articulate.

These workers mobilise peasant women under the banner of one political party or the other on women's issues – especially on the use of improved 'chullas', self-employment, adult literacy, primary health care, family planning, etc, along with mobilisation for other political issues, viz. voting, distribution of surplus vested land, food for work programmes, etc. These women have been substantially successful in organising women against wife beating, to send their children to the school, to improve the general sense of health care and family planning. They also constantly raise their voices in village panchayats on the issues of gender-based wage discrimination, dowry, and self-employment opportunities for women.

Although these women have emerged as 'change agents' for women, their participation in overall decision-making has remained negligible both in their own families and in society. The village panchayats have so far been dominated by male members and women have had a very limited voice. Institutionalised mobilisation is carried out in the village panchayats in accordance with the decisions and directives of the party headquarters. The women members are to work within this predefined area of politics. Again, some of these women political workers are caught up in dependency relations since their goal is not to remain as political workers but to get some benefits either for themselves or for their close ones. These peasant women usually shun physical labour or manual work. They also try to imitate the life-style of upper caste or urban middle class women. Such contradictions are, indeed, inherent in the institutionalised pattern of grass roots mobilisation. However, in spite of such limitations they have been largely successful in helping women articulate their own issues which are distinctively different from those of men. Peasant women have largely been aware of their distinctive identities and issues. Indeed, what they need is only a space for the expression and actualisation of their goals. These women political workers are not given that space within this reformative mobilisation of the peasantry.

Conclusion

Empowerment of women is a political issue located in a broad social context. Empowerment of women is possible only by undoing the already existing structure of power, which has inherent class, caste and gender biases. The traditional arrangement of society, its institutions, values, norms, culture, education, and pattern of socialisation, help perpetuate such imbalances. Peasant societies are traditional and value based. Thus any process of institutionalisation only reinforces the institutions of patriarchy, gender segregation and caste and class inequality.

The constitution of independent India has recognised gender equality as one of its foundation stones. However, there remain enormous gaps and contradictions between the constitutional mandates and inherited social realities in India. To fill these gaps various legislative acts and amendments to the constitution have been made for gender equality and empowerment of women. Various voluntary organisations and non-governmental agencies have come forward to provide grass roots organisational support to rural women in some areas of the country. Sincere efforts are made by these organisations to break the gender barriers of development. Broad strategies are framed for greater recognition of women's work, creation of employment avenues for women, and provision of training facilities and adequate information on various avenues of employment for women. Strategies are also framed for their participation in political decision-making and to train women to carry forward their struggle for social equality. In recent years India has borne witness to the proliferation of numerous women's organisations many of them having wide networks across the country. The women's movement and women's organisations, which were confined to urban India in the 1970s and 1980s, are now spreading even in remote areas, though at a slow space.

It is expected that the conditions and quality of life of peasant women will improve gradually with the implementation of the policy initiatives of the government and increasing mobilisation and support of these grass roots organisations. The question, however, remains – will these organisations and efforts for mass mobilisation be able to sustain the momentum of gender equality and be able to generate the space for empowerment of women without a radical agenda of changes in the institutional arrangements of society? Experiences of the peasant movements and contemporary grass roots mobilisation show that women's empowerment should take the form of a self-conscious social movement with a well-designed and co-ordinated strategy for far-reaching changes in the institutional set-up. Such change would begin from women's self-assertion and take the form of collective protest against institutional bondage, traditions and perceptions. NGOs and women's organisations should provide the broad organisational and ideological base to create such a stimulation and for the sustenance of its momentum. Rural women are already aware of their issues, they should only be given the required space for the articulation and expression of their perceptions. They would be able to define the form and extent of their empowerment by themselves.

Few Universal Solutions

Biswajit Dhar

Economic and Social Survey of Asia and the Pacific, United Nations, New York, 1995; pp xii+155.

IN the past few years, the Asia-Pacific region has been the focal point of attention due to the remarkable growth performance of the newly industrialising countries even as the industrialised world was struggling to find a way out of the persevering recession. The economic dynamism exhibited by the former has prompted many to comment that the Asia-Pacific region would emerge as the new growth centre of the global economy. This view has found support in more recent years as the growth syndrome of the NICs has had a spread effect with the countries of south-east Asia showing similar economic performance. Coexisting with these dynamic countries is another set of countries in the region that are among the poorest in the world and for whom stepping up of economic growth has become a daunting task. Yet another dimension of Asia is provided by the central Asian republics which are in the midst of unparalleled economic decline. These contrasting faces of Asia are extensively documented by the ESCAP in its annual *Economic and Social Survey of Asia and the Pacific*. The latest survey, apart from providing a useful round-up of the Asia-Pacific economies, analyses in depth two of the more vexed issues of present times, viz, financial sector reforms and social security. What makes the Survey distinct from the other attempts made by inter-governmental organisations while addressing similar issues is its emphasis on the analytical content rather than on simple-minded prescriptions. By bringing forth the degree of variation in countries as regard these issues, the Survey gives an important message that there are no quick-fix solutions to such intricate problems as financial sector reforms.

The macro-economic overview of the region has been provided by considering a mix of analytical and sub-regional categories of countries. Thus, while the least developed countries (LDCs) and the developed countries have been treated separately, the remaining countries have been classified according to the sub-regions to which they belong. A point worth considering here is whether strict analytical categories would have been better suited for the purpose than the mix of categories stated above. This could have been done in the Survey without making any significant reclassification of the countries since the sub-regions are broadly found to conform to analytical categories. Thus, south Asia comprises essentially the low income countries, south-east Asia of the middle income countries and the central Asian republics of the economies in transition. Countries of the sub-regions of east Asia and the Pacific can be reclassified into their appropriate analytical groups.

Reforms Programme

The macro-economic performances of two sets of countries, viz, the least developed countries and the central Asian republics, reported exhaustively in the Survey are worth mentioning. The performance of these countries assumes significance in view of the fact that they have undertaken a sweeping reforms programme to ameliorate the serious structural problems they were faced with. What is of particular interest is whether the policies of privatisation and marketisation adopted by these countries were to help them accomplish the twin targets of adjustment and stabilisation or a mix of policies using strategic interventions by governments, *a la* east Asian countries, should be considered.

Most of the 12 LDCs in the region had started showing signs of recovery in the 1990s. In 1993, the latest year for which data are provided for all countries, the LDCs recorded positive growth in GDP. What is more, in all but two cases the GDP growth recorded was upwards of 4 per cent. In four countries, for which data for 1994 are also provided, a continuation of the growth momentum was observed. However, for most of the LDCs, this relatively impressive growth notwithstanding, the singular problem was maintaining stability in growth performance. Except Bangladesh, which has shown a continuous improvement in GDP growth through the 1990s, the other countries have recorded wide fluctuations.

An added dimensions of stability seen in case of Bangladesh was in respect of the low rate of inflation. In 1993, inflation was down to less than 2 per cent from nearly 8 per cent at the beginning of the 1990s. Inflation was down to a single digit in all countries barring Cambodia, Myanmar and Maldives. The mounting price spiral in Cambodia has been a particular cause for concern as the consumer price index rose by more than 120 per cent in 1993. Although this increase was significantly less than the 172 per cent increase in 1991, triple digit increase in 1993 comes after inflation had gone down below 100 per cent in 1992.

A common feature of all the LDCs, not quite unexpectedly though, is the large magnitude of resource gap caused mainly due to low levels of domestic savings. With the exception of Bhutan in all countries domestic savings as a percentage of GDP stood at less than 10 per cent, and the small island economies of Tuvalu and Samoa and Kiribati had recorded negative values.

The most important problem faced by the LDCs is the macro-economic imbalances. While achieving stability is a desirable objective, the Survey quite appropriately comments that this is not a sufficient condition for sustained development in these countries. Thus, from among the LDCs, only Bangladesh was found to have achieved a degree of macro-economic stability but the country is struggling to make the transition to a path of sustained economic growth.

Economic declines of the central Asian republics continued unabated during 1994. The now-familiar features of the macro-economic scenarios of these countries, viz, steep declines in Net Material Product (NMP) along with hyper-inflation, were shown by all countries. In 1993 Turkmenistan showed some signs of recovery with its NMP registering a growth, but a sharp reversal took place in the first eight months of 1994 as a 17 per cent fall was registered.

The inflationary pressures faced by these economies in transition had exacerbated in 1993 after relative declines in the previous year. Inflation was upwards of 1,000 per cent in all countries with Uzbekistan recording the highest increase in the consumer price index of 2,500 per cent.

The biggest challenge facing the countries of central Asia is to give effect to meaningful institutional reforms in keeping with the transformation of their economic systems. While major steps towards introducing private enterprise have been taken, the transition from the centrally-planned system has been far from smooth because the required institutions to support the former have taken long in coming. An additional problem pointed out in the Survey has arisen since the countries have tried to introduce fiscal discipline by effecting cuts in the social sector expenditure. All the countries inherited elaborate systems of social care and there are strong pressures to defend these systems. The need to avoid a significant erosion in the standard of living arising out of any cuts in social

expenditure while at the same time controlling budgetary expenditure is among the several critical issues that confront the economies in transition.

Contrasting Pictures

The low and middle income countries of south and south-east Asia respectively present contrasting pictures of economic performance in the 1990s. While the former countries, with the exception of India, showed hesitant tendencies at recovery, the latter have shown an upward movement in their trend rate of growth

That the macro-economic situation has improved in the middle income countries is confirmed by the single digit inflation rate seen in all countries in 1995 and 1994 This contrasts with the low income countries where double digit inflation was recorded by all countries.

The data provided in the Survey leave many points to ponder over the growth prospects of the low and middle income countries. The savings-investment behaviour, in particular, needs to be looked at this context The savings to GDP ratios in all middle income countries, except the Philippines, have been over 30 per cent, with Singapore maintaining a ratio of over 45 per cent Investment rates have also kept in step with these phenomenal saving rates In sharp contrast, the low income countries of south Asia have been recording lower rates of both investment and savings. For instance, in the case of India, savings as a percentage of GDP ratio has been pegged around low 20s for quite sometime now, while Pakistan is yet to reach near the 20 per cent level The inability of these low income countries to improve their savings rate should be compared with the high performer among low income countries, viz, China. China has been able to join the ranks of the middle income countries in recording very high savings to GDP ratios consistently through the 1990s. The rates of saving that countries have shown can quite definitely be taken as indicators of the potentialities that exist in the respective countries for enhancing the growth momentum.

Strategies to influence the savings-investment behaviour therefore assume importance. Liberalisation of the financial sector, particularly interest rate reform, has been the dominant prescription in this regard. The veracity of this prescription has been closely scrutinised in a later part of the Survey dealing specifically with financial sector reforms.

The perspective on the external sector provided in the Survey is set against the backdrop of the emerging trade regime under the jurisdiction of the World Trade Organisation (WTO) on the one hand, and the increasing tendencies at forming regional trading arrangements on the other. The Asia-Pacific region has seen a number of initiatives to operationalise regional trading of which at least two, viz, the ASEAN Free Trade Area (AFTA) and the South Asian Preferential Trading Arrangement (SAPTA), have taken firm roots. But as these initiatives are being taken, the rigours of establishment of APEC, the mega trading arrangement linking countries on both sides of the Pacific, are also being gone through. The strengthening of these trading arrangements, the Survey indicates, would result in a fuller utilisation of the potential of the region through greater intra-regional trade and investment flows.

Trade and Payments Prospects

The Survey has tried to project favourable trade prospects for the countries of the region based on its assumption of a positive impact of the Uruguay Round Agreement. This view is somewhat questionable given the overwhelming evidence that indicates a differentiated impact of the Uruguay Round on developing countries. Studies have shown for instance that the LDCs in particular and the agricultural importing countries in general would stand adversely affected when the Agreement on Agriculture is implemented The phasing out of the multi-fibre arrangement (MFA), discussed separately in the Survey, is another area where developing countries may not gain to the extent desirable. Still other contentious issues including social clause and environment, which can be used as non-tariff barriers having a bearing on trade prospects of developing countries, are waiting to be introduced. All these do not add up to be a happy augury for most developing countries as far as their future trade possibilities are concerned.

The trade and payments situation of the countries in the region during the 1990s is elaborately discussed in the Survey. Trade was buoyant in most countries, with the south-east Asian countries continuing to maintain their momentum of trade expansion. These countries have now been joined by Sri Lanka, India and Vietnam who have been able to rapidly expand their trade during the past two years. However, in order that the latter countries are able to sustain their trade expansion it is necessary for them to find enduring links with the dynamic segment of the region. India, for instance, has established active contact with ASEAN by becoming its sectoral dialogue partner.

While the overall balance of payments outlook for the region has been dealt with, the Survey does not touch upon the important issue of external debt. Although the Asian region has largely been free from the acute problem of debt overhang, the situation may change considerably in the near future due to the appreciation of the yen in recent months. Most of the dynamic countries, including China, have a large component of yen-denominated debt and the upward movement of the currency would put severe strains on their external payments positions. Apart from these countries, large debtors like India are potentially in a vulnerable position arising out of interest rate fluctuations. This is so particularly at the present juncture when the country is witnessing major changes in its composition of the debt-stock with a fast decline in the proportion of the concessional credit.

Financial Sector Liberalisation

Liberalisation of the financial sector, now accepted by all countries as an essential element of the economic reforms package, is one of the focal points of the current Survey. This discussion, which brings out the various dimensions of the major issues involved in a very lucid manner, deserves to be included as an essential reader in this area. The need to undertake financial sector reforms is argued out systematically and critical evaluation is made of the progress of these reforms in different countries.

The impact of government regulation, it is argued, had led to repression of the financial sector in most countries resulting in financial shallowness The scope of financial services remained limited even in the modern sector, it is pointed out. The programmes of directed credit undertaken by the governments were often aimed at providing access to cheap credit. Interest rates were curtailed and as the Survey brings out, nominal rates of interest were set at low levels that barely covered the inflation rates. This resulted in very low or even negative real rates of interest, a factor which is largely held to have inimical effect on domestic savings.

Four main components of financial sector liberalisation have been dealt with in the Survey. These are: (i) reforms of the banking sector, (ii) interest rate reforms, (iii) development of other capital markets, and (iv) external financial liberalisation.

Banking reforms in most countries in the Asia-Pacific region have entailed privatisation of state-owned banks and opening new areas for banks to operate. Foreign banks, which in most countries had a very restricted role to play, were allowed greater freedom to operate under the dispensation. But while banks were freed from most controls they were earlier subjected to and decide on the ways to manage their portfolio, a new form of regulation has now been introduced for ensuring that these institutions follow sound business practices Most countries in the Asia-Pacific region have adopted the regulatory principles laid down

by the Bank for International Settlements (BIS) based on the capital-adequacy norms. Several countries have already achieved the BIS prescribed capital-adequacy norms of 8 per cent by 1994, but many other countries, the Survey indicates, have found it difficult to achieve these norms within a realistic time frame.

Interest rate deregulation has been the critical area of reform aimed at increasing efficiency of the financial system. The Survey provides a systematic overview of the policy initiatives taken by several countries in this regard. The impact of interest rate deregulation on the deepening of financial markets has been assessed by considering the trends in M_2 and financial savings, including foreign currency deposits in financial institutions. Figures provided in the Survey show that there have been a number of countries, including LDCs like Bangladesh and Nepal, where the process of financial deepening was under way. The use of M_2 as an indicator should however be made with caution since it is influenced by flows of speculative capital. Since many countries in the region have seen inflows of this form of capital, financial deepening may actually have been far less than those the data suggest.

Directed credit programmes for disadvantaged groups in the economy were however kept in place by most countries even as they were carrying out reforms in their financial sectors. This, as is argued in the Survey, was because a liberalised system raises the possibility of creating a socially unacceptable distribution of credit. However, in order that the poor are more effectively supported through credit schemes, the Survey proposes a reorientation of the formal financial institutions towards these schemes. In particular, it has been proposed that links between the financial institutions and the non-governmental organisations should be forged. It has additionally been suggested that schemes such as those managed by the Grameen Bank of Bangladesh and the Rashtriya Banyiya Bank of Nepal could be strengthened for a wider coverage of the poor.

The most significant aspect of financial reforms in the Asia-Pacific region has been the development of other financial markets. In many countries of the region, the equities market has showed phenomenal increase since the late 1980s. An indication of the growth of the equities market in the Asian region can be seen from the fact that while the average monthly trading value of Hong Kong's stock market increased by 267 per cent between 1991 and 1993, the New York stock exchange had grown by only about 50 per cent during the same period. Corporate bond markets were in the initial stages of development in several countries. Institutional mechanisms for assessing the risks involved in these instruments have been established among others in India, Malaysia, Indonesia, the Philippines and Thailand, but as the Survey indicates, there are several challenges that these rating institutions face. The functioning of the institutions has been made particularly tough by lower standards of accounting and disclosure as compared to the developed countries.

External financial liberalisation has made most progress in the countries of the Asia-Pacific region. Exchange rates have been made flexible in all countries while several countries have eased restrictions on capital flows. These policy changes have been adopted, the Survey points out, in keeping with the view that financial openness would have its beneficial impact as savings are pooled and allocated globally in the most efficient manner through unbridled movement of capital. But this financial openness, the Survey emphasises, has made management of the financial sector and monetary policy a difficult task for the governments.

Financial liberalisation of the kind taking place in countries of the region raises several piquant issues, many of which have been raised in the Survey. The most important concern arises from the fact that not only has financial sector liberalisation not led to the declared results in most countries, they have often increased the vulnerability of the economies as compared to the past.

Country experiences of the Asia-Pacific region are found to run contrary to the expectations of a positive influence on savings and investment accompanying deregulation of the financial markets. While countries having some of the most repressed markets, e g, China and Korea, have recorded impressive results, others, most notably the Philippines, with relatively open and liberal financial regimes are much less successful. This confirms the findings in several studies that financial liberalisation has made little difference to overall saving and investment. These contradictory experiences do indeed raise a valid question of whether financial liberalisation is either a necessary or sufficient condition for growth.

The integration of the domestic financial markets with the global economy could, as the Survey points out, subject the economies in the region to destabilising influences. Countries can be affected as interest rate differentials between countries can cause large outflows of short-term funds. The effects of such flows on exchange rates, domestic money supply and prices can be so severe that they could be beyond the capacities of the authorities in the affected countries to manage.

Further, volatile movements of short-term capital have compelled the central banks in many countries to intervene and in some cases the central banks have incurred unexpected losses. The complexities involved in undertaking financial liberalisation for achieving the desired results are thus unambiguously brought out in the Survey.

These problems associated with financial sector liberalisation should be considered in the context of an oft emphasised point, viz, macro-economic stability is a necessary and sufficient condition for financial sector reforms to take place. A number of countries in the Asia-Pacific region are yet to attain a reasonable degree of stability, as discussed earlier, and this factor needs to be given due consideration as countries undertake in reforms in this key sector.

Social Security

One of the main concerns in the Asia-Pacific region is the persistence of social problems despite the strong economic showing by several countries. Poverty has continued to be a major problem in most countries notwithstanding policy interventions to remove it in the past. Vast numbers of the poor continue to be deprived of the basic needs such as adequate food, shelter, medical care and education.

The status of the social security systems existing in various countries in the region has been exhaustively discussed in the Survey. The discussion deals with the nine contingencies identified in the ILO Conventions for the conferment of social security benefits. The review of the social security systems in different countries shows that the schemes are narrowly focused, in that they cater mainly to those employed in the organised sectors of these economies. Workers in the agricultural sector as well as the self-employed are not covered under the existing social security systems. Thus, a considerably large section of the population stands deprived. Furthermore, even those who are eligible for the conferment of the benefits do not find themselves adequately compensated.

Although social security protection is extended to workers in the organised sectors in most countries, there are some instances where selected groups of workers belonging to the informal sector have been successfully covered. The Survey highlights a few initiatives taken in India for the benefit of the latter.

A group accident scheme for active fishermen has been sponsored by the government of India that covers all active fishermen between ages 18 and 65 years holding fishing licence. While the fishermen's co-operative and a public sector insurance company manage this scheme, 75

per cent of the premium is shared by the central and the state government.

Primary milk producers in Mehsana district of Gujarat are covered by a life insurance scheme in which the milkmen's co-operative plays the key role. In this case, 55 per cent of the premium is borne by the co-operative societies to which the beneficiaries must belong. These schemes can serve as a model for organising the workers in the informal sector through co-operatives with a view to covering them under social security schemes. However, the success of these schemes, the Survey emphasises, is dependent on the institutional and legal support that the respective governments are able to provide.

The Survey proposes that a multi-tiered approach could be adopted as a long-term strategy for providing social security to a much larger section of the population in the countries of the region. The basic tier of this system could be the universal basic assistance from tax-financed government programme in the form of family support, minimum pension and incomes and a guarantee of basic needs (primary health care, primary education, food security and safe drinking water). A contributory social insurance system among employees and the self-employed, and a private voluntary initiative within a regulatory framework could form the second and the third tiers of this multi-tiered approach. This sharing of responsibilities by different agencies could result in a more effective system of social security than appears feasible in developing countries that have very large populations to cater to.

One of the most important messages that comes out of the Survey is that archetypal solutions do not exist for countries trying to achieve economic development. This could be seen most notably in the case of financial sector reforms where the uncritical acceptance of the logic of the market did not provide any solution to the problems that the countries in the region were faced with. Social security is another important area where considerable intervention by the government and its agencies are seen to form the basis for its success in the countries of the Asia-Pacific region. It thus needs to be emphasised as a corollary to the above that development strategies need to be a constantly evolving process and that the particular objective conditions in the countries need to be given a larger priority than what conventional wisdom of our times suggests.

People and Shelter

Mouleshri Vyas

Community Participation and Slum Housing: A Study of Bombay by Vandana Desai; Sage Publications, 1995, pp 347, Rs 350

COMMUNITY participation, as an ideology and an essential aspect of development work has gained increasing prominence in the recent past. Through a comprehensive presentation of the findings of a study of three slum pockets in the city of Bombay, the author highlights dimensions of community participation in the context of slum housing.

At the core of her research method are two surveys – the first quantitative and the second, qualitative in nature – in the three slums selected. Regular visits to the communities and frequent interaction with people and leaders have substantiated the findings and analysis. The review of literature on the issue is commendable for the range of aspects related to community participation that are discussed. It is comprehensive and makes for interesting perusal as the questions emerging from it lay the ground for the subsequent discussion that is based on the study. The author examines different perspectives on participation of the issue *vis-a-vis* housing. The question of whether structural change is necessary to bring about authentic participation is a basic one, and is raised through comments by others who are quoted.

The role of the state as a co-operator in housing development and the implications of this on low income group housing where decisions get taken by outsiders to the community, are of relevance here. Providing shelter, therefore, is more than creating physical infrastructure.

The policy context of participation indicates the role of governments and institutions such as the World Bank in enhancing the importance of community participation in specific projects. NGOs also have a definite role to play in promoting participation and this is analysed objectively with both the strong points as well as the limitations of NGO intervention in view.

Desai moves on to tracing the evolution of Bombay city, with its demographic features, economic development, industry, trade, finance, housing, etc, which is fairly descriptive. The narration of various institutions in the city, which ensues, throws light on different legislations in relation to land ownership, tenancy and housing in the city. Hence, the role of the Bombay Municipal Corporation (BMC), Bombay Metropolitan Region Development Authority (BMRDA) and Maharashtra Housing and Area Development Authority (MHADA) in provision of housing and infrastructure is traced; the linkages between these various agencies are clarified and the importance of co-ordination among them is made evident.

The Slum Improvement Schemes and Slum Upgradation Programme offer scope for positive changes in housing conditions and environment. The author avers that for the deteriorating housing situation in the city, in the absence of a political will, the government cannot solve the accommodation problems of the economically weaker sections, and that even today, "the authorities have not made up their minds how to solve the problems of shelter". Her analysis of the housing problems of the poor, from the point of view of the role of the government seems to substantiate the above opinion.

The three slums studied are located in different parts of the city, viz, Wadala, Worli and Kurla. Desai mentions the points of difference among them as social class, spatial configuration, etc, and similarities being their central location, their integration into the wider market economy and the fact that they are much affected by structures of state bureaucracy. The slum improvement/upgradation programmes have been carried out in the three slums and there is one NGO which works in all the three areas. This is also a common element.

Her portrayal of the slums is descriptive and creates a vivid picture of the physical environment and the lives of people. This would be of particular interest to those who are far removed from the reality of life in such conditions, and desirous of knowing more about the same. For those familiar with life in slum communities, there is not much that is new in the findings and one realises the scope for generalisation from one's understanding of other slums, since the broader issues and concerns do not differ much.

People's participation in these slums is examined through the role of community organisations – these being self created, independent organisations of the residents, and the role that leaders in the community have to play in solving various problems of people and getting them access to basic amenities. By analysing the class composition of slums and nature of life-styles and interests of each group, the reasons why certain groups of people come forward to move beyond personal concerns and why certain others don't is reflected. The manifestations of ethnicity, gender roles and caste identity, on relationships and on participation are valid concerns as well. The leaders or the 'initiators', seem to be in possession of certain resources and skills which make for their favourable impact at the community, as well as the bureaucracy level. The political nature of this interface between leaders from the

community and municipal officials, political representatives and others is dwelt on. Desai holds that any distinction between 'social' and 'political' movements is 'merely semantic' since social movements may also have a clear objective of bringing about political change. She subsequently examines whether such slum-level struggles are a social movement and her stand here is in the affirmative.

The supra systemic influences on the slums have been analysed and dynamics of NGO, bureaucracy, political party and people's interactions highlight the interests of each, their ways of functioning as well as the nature of mutual interdependencies which exist, in a perspective of power that each hold and exercise. That NGOs have to work in increasingly turbulent and politicised environments adds to the complexity of their intervention. Desai says that there is scope for future research to examine the ways in which NGOs fill the gap in service delivery between the government on one hand an urban poor on the other, and the dynamics of this process.

The soundness of the literature of review raises relevant questions which relate to the findings of the study. Perhaps a more substantive articulation of answers at certain points would have clinched the issues. Desai's presentation of the study is objective, yet the concerns reflected seem positively biased towards the urban poor. The role that governmental and municipal bodies can play in the area of housing is amply clear from her discussion.

It can, I think, be possible to examine the process/issue of participation from two angles. One can decontextualise it and examine the dynamics of indigenous participation in any community - and reasons why communities are naturally organised. However, when participation is examined in the context of any specific scheme or intervention, which is the second angle referred to, then the two angles need to be merged very clearly. One can analyse (a) Community level relationships and structures, as they influence participation, and also (b) Features within the specific schemes/intervention initiated which encourage/limit participation. This would merit a look at the efficacy of institutional structures created as part of development efforts, which is significant since the scheme does not become an end in itself. But if participation is seen as a political process then the impact of such a scheme or venture on people's empowerment is important. These issues could have emerged more emphatically in the analysis.

The aspect of eliciting participation from people is a feature of projects undertaken on a mass scale, and very often reflected as a concern because of stands taken by donor agencies. Desai has pointed out the need for preparedness and orientation among bureaucracy to encourage participation of people. It would, I think, also be crucial to examine in depth, the level to which participation can be elicited within the framework of various schemes. Whether people are involved at the level of (a) information dissemination, (b) consultations, (c) decision-making, or (d) taking necessary action and doing things, is significant. It is through this that concerns for target fulfilment and capacity building or empowerment of people get manifested. The integration of the two angles would make for effective participation as well as greater satisfaction of 'beneficiaries' of schemes.

Various questions reflected in the book are thought-provoking for social activists, students and academicians, and persons new to the analysis of slum life and concerns would also find this a very informative volume.

World Bank on Fiscal Adjustment in India

M Govinda Rao
R T Shand
K P Kalirajan

The World Bank's Country Economic Memorandum (CEM) on India this year reviews the progress of fiscal reforms at central and state levels. However, like in the past, the emphasis on reducing fiscal deficits rather than increasing public savings robs the analysis much of the relevance. Also, its assertion that there is no further scope for expenditure compression and additional deficit reduction should be achieved by increasing taxes is not based on sound empirical analysis. In fact, such a recommendation may signal a spate of spending on populist schemes as has been seen recently. Similarly, attributing fiscal problems at the state level to inadequate revenue efforts is not based on facts. This can not only encourage profligacy, but also may introduce additional sources of inefficiency.

I
Introduction

THE World Bank's Country Economic Memorandum (CEM) on India this year reviews, among other things, the progress in fiscal adjustment undertaken in the last four reform budgets and makes a critical appraisal of state-level fiscal reforms. The World Bank's analysis on these issues is particularly important for several reasons. The analysis in the CEM puts forth the point of view of the World Bank and therefore, gives more or less credibility to the policies pursued so far by the government and thus signals future policy directions.

Given that the economic crisis which triggered the reform process in 1991 itself was diagnosed as the consequence of the severe fiscal imbalance that afflicted the economy throughout the 1980s, a detailed review of achievements and challenges after four years of fiscal adjustment efforts is opportune. Further, in a federal polity like India where the state governments have a predominant role in the provision of social services, (particularly the human resource development) and many of the economic services, a review of state level reforms is equally critical. Therefore, it is important that the appraisal of the issues is accurate and balanced and based on sound economic reasoning.

In particular, a proper appraisal of the issues could minimise competitive populism in fiscal policy regime in a pre-election year while an inaccurate appraisal can give credibility and endorsement to populist pressures. A critical appraisal of the analysis contained in the CEM is therefore, is extremely important.

In any assessment of fiscal adjustment at central and state levels, the overall objective of economic reforms must be kept in view. The objective of economic reforms in India has been to stabilise the economy in the short to medium term and to accelerate the growth rate with more equitable income distribution by improving the efficiency in the resource allocation and giving an outward orientation to the economy in the medium to long term. Fiscal reforms must therefore be analysed from the perspective of whether and to what extent they have helped to achieve improvement in resource allocation or at least whether they are directed towards reducing resource distortions. This note reviews the CEM from this perspective, examines whether its diagnosis of the ills is accurate and whether its suggested solutions would improve the competitiveness of the Indian economy.

Of course, the CEM has also reviewed monetary and trade policies and has gone into the micro issues of improving the standards of physical and social infrastructures in considerable detail. However, fiscal adjustment and state level reforms have received the greatest emphasis in the report and accordingly, our analysis of the assessment made by the World Bank is confined to the fiscal issues at central and state levels.

The plan of this paper is as follows: Section II summarises the World Bank's diagnosis of the fiscal disease afflicting the Indian economy at both central and state levels. Section III identifies the major weaknesses of the World Bank's diagnosis. In Section IV, possible policy repercussions of the World Bank's diagnosis are presented in concluding remarks.

II
Disease and Its Diagnosis

The report reviews the structural changes effected in the Indian economy since the reform process was initiated four years ago, records the achievements and lists the unfinished tasks and challenges facing the policy-makers. After reviewing the progress in stabilising the economy, the report proceeds to identify the structural rigidities needed to be overcome to improve efficiency in resource allocation. The diagnosis of the disease automatically leads to the curative measures to strengthen the reform process. The logical extension of the structural reforms is to identify fiscal, financial and institutional problems at state level. Attention to state level reforms is warranted because (i) state governments play a predominant role in the delivery of social and economic services. They account for 85 per cent of spending on social services and 56 per cent of spending on economic services,[1] and therefore, their financial and institutional weaknesses could pose a serious constraint on the infrastructures, and (ii) the essence of reform is to improve the enabling environment for which systemic changes are required in the policy regime which should encompass all the departments and ministries at both central and state levels.

The CEM, like the *Economic Survey* of the ministry of finance, this year emphasises the undesirability of the deteriorating trend in public sector saving and highlights the imperative need to reverse the trend not only to accelerate growth and reduce poverty but also to make fiscal policy more effective as a stabilising instrument. However, when it comes to the details, the focus is not so much on public savings, but on fiscal imbalances as measured by fiscal deficit. The CEM notes that after successfully reducing the fiscal deficit from 8.4 per cent of GDP in 1990-91 to 5.7 per cent in 1992-93, the central government could not prevent it from increasing to 7.7 per cent in 1993-94, due partly to expenditure overruns and partly to tax revenue shortfalls. For 1994-95, the government set a relatively modest fiscal deficit target of 6 per cent of GDP as stronger external accounts have reduced the threat of macro-economic instability.

The CEM warns that persistence of high fiscal deficits is a major threat to macro-economic stability. The report demonstrates that, under reasonable assumptions, in order

to achieve the inflation target of 5-6 per cent and increase the growth rate to 7-8 per cent, at 5 per cent real rate of interest, the primary deficit should not exceed 1.5 to 2.2 per cent. In other words, if the GDP grows at lower than 5-6 per cent, it is necessary to have primary surpluses just to stabilise the domestic debt-GDP ratio. Therefore, a further reduction in fiscal deficit by about 2 percentage points to a level of 3-4 per cent of GDP is critical to achieve government's growth and inflation objectives and to bring fiscal imbalances to sustainable levels.

How should this be brought about? According to the CEM there is not much scope for expenditure compression in fiscal correction. Fiscal adjustment should minimise the burden on the poor and therefore should not reduce public expenditures on human resource development and targeted anti-poverty programmes. Some scope for reducing food and fertiliser subsidies and readjusting oil prices is recognised, but the corrective measure is seen to lie primarily in continued reliance on tax reforms to improve revenue productivity and more aggressive privatisation with the proceeds earmarked to retire the debt burden. The report states, "...non-interest expenditures already have borne the brunt of fiscal adjustment and not much room is left for further reductions."

The CEM stresses the need for state level reforms for two important reasons: (i) the states have a predominant role in the provision of social and physical infrastructures; therefore, improvement in the ability to finance these services and effectiveness of delivery systems at the state level is important. (ii) Significant improvement in the conditions can come about only when concerted effort is made to change the enabling environment by all the concerned agencies at both central and state levels. Discrete changes in some policies by a few central ministries cannot change the institutional environment.

The CEM makes a fairly detailed review of fiscal developments in the states to assess their performances and to identify the financial and institutional constraints on the delivery of social and physical infrastructures. The report notes with concern the rapid increases in revenue expenditures and the declining share of capital expenditures in total expenditures. In the judgment of the CEM, the states will not be able to sustain their current patterns of expenditure. The problem in state finances, however, is not seen to be due to overspending (p 40). According to the CEM, the problem has arisen due to '.. *the absence of improvements in the own revenue efforts of states as a group*' (emphasis as in the original). To substantiate this, the CEM provides evidence that the states' actual additional resource mobilisation during the Eighth Plan was around 38 per cent of the target. Consequently, the hard budget constraint on the states (which is partly due to their inability to manoeuvre borrowing) has crowded out socially productive expenditures. Thus, the problem on the expenditure side is not its size but its composition. Therefore, the CEM recommends, '...as part of the effort to improve public savings, states should seek to reduce their fiscal deficits through a concerted effort on the revenue front.'

The analysis of the resource position of the states leads to the examination of intergovernmental transfers as well. The report refers to multiple agencies making transfers – the Finance Commission, a constitutional body, and the Planning Commission, "a body not required by the Constitution". In fact, the transfers designed by various central ministries are wrongly attributed to the Planning Commission. While the Finance Commission has been found to be successful in reducing inequities, the discretionary transfers of the Planning Commission have offset the attempt to reduce horizontal imbalances across the states. Of course, it also repeats the disincentives arising from the fiscal dentistry practised by the Finance Commission, points out the tyranny of the base year selection and recommends the need to relate transfers to shortfall in fiscal capacities of the states (in its view cost disabilities do not seem to be a serious problem).[2] It is also pointed that the system tends to encourage the diversion of funds from the projects approved by the Planning Commission to meet recurrent expenditures which is considered undesirable. The CEM also lists the initiatives taken by various states, albeit limited, to reform their fiscal systems.

III
Empirical Evidence on Fiscal Adjustment

The World Bank's attempt to take stock of the achievements, identify future challenges and to prescribe the policies to meet those challenges is opportune. However, accurate diagnosis of the problems is the key to prescribing required policy changes to evolve fiscal policy for growth and stability. In this section, we examine whether the empirical evidence on fiscal trends at the centre and the states lends support to the CEM's diagnosis.

The report rightly endorses the concern expressed in the 1995 *Economic Survey* that public sector savings have continued to deteriorate when it states, "...without substantial improvements in public savings, the economy will not be able to accommodate higher levels of investment – public and private, physical and social – needed to accelerate and maintain growth, and reduce poverty." However, the concern for declining public savings stops at this statement and there is hardly any discussion on how this undesirable trend can be reversed. In the analysis of macro-economic developments, reducing fiscal deficits takes centre-stage and a strategy to improve public savings simply takes a back seat. But, reduction in the fiscal deficit does not necessarily add to public savings as has been clearly demonstrated by Indian experience during the last four years. After four years of fiscal adjustment, the fiscal deficit as a proportion of GDP was reduced from 8.4 per cent in 1990-91 to 6.7 per cent in 1994-95 while governmental dissaving actually showed a marginal increase from

Notes: BE: Budget estimates, RE: Revised Estimates.

3.5 per cent to 3.8 per cent (Table. 1). This was achieved mainly by reducing capital expenditures from 6 per cent of GDP to 4.3 per cent, partly by selling public sector equity (0.6 per cent of GDP) and through a host other adjustments (like appropriating the profit of the RBI).

Let us first take up the discussion on trends in fiscal deficits. The inability to reach the deficit target is attributed to both expenditure overrun and tax revenue shortfall. In 1993-94, when the fiscal deficit figure overshot the target by over 3 percentage points, revenue expenditure exceeded the target by 1.1 percentage points, capital expenditure by 0.6 percentage point and the shortfall in tax revenue was one percentage point (Table 1). However, in order to make a correct diagnosis of the problem and to make policy recommendations it is not enough to state these facts. It is necessary to examine why it happened. Analysis shows that the reason for the inability to achieve the deficit target is due partly to the attempt to show smaller fiscal deficits in the budget estimates by showing optimistic revenue estimates and partly to the lack of political will to compress revenue expenditures. Das-Gupta and Mookherjee (1993) have shown that there was no basis for assuming a 16 per cent growth rate for tax revenues in 1993-94. At the same time, the intention in the budget was to reduce non-interest revenue expenditures from 8.7 per cent of GDP to 8 per cent, but the government could not muster the necessary political will to compress wages and salaries or transfers and subsidies. For example, the original intention to reduce the fertiliser subsidy was not politically feasible and had to be restored. In any case, both targets were too optimistic [Sen, Rao and Ghosh 1994].

What is worrying is not so much the attempt to project smaller deficits by overestimating revenues and understating the expenditures. In a sense, this may actually be useful, for it helps at least to set targets. Rather, it is the inability to muster the political will to reduce public dissavings as targeted. Any attempt by multilateral agencies to rationalise and justify this removes a source of pressure on the government to exercise fiscal prudence. In the CEM, the slippage in conforming to the deficit target in 1993-94 is simply attributed to stagnant industrial output. Furthermore, the deficit reduction and much less a reduction in public dissavings, are no longer important for the CEM. It justifies the lower targets for 1994-95 by stating that, as the external accounts were stronger fiscal imbalances were not a threat to macro-economic stability and therefore, the government could afford higher deficits. This implies that, with a comfortable external reserve position, the government need not unduly bother about fiscal discipline!

FIGURE 1: REVENUE RECEIPTS AND REVENUE EXPENDITURES OF CENTRAL GOVERNMENT

The CEM's observation that non-interest expenditures have already borne the brunt of fiscal adjustment and therefore, further reductions in fiscal deficits are to be achieved not by compressing expenditures, but by augmenting tax revenues or by restructuring public enterprises is not borne out by facts. A careful analysis of the expenditure trends since 1990-91 shows that while capital expenditures were clearly crowded out, there has not been any significant change in the level of non-interest current expenditures. The decline in the expenditure-GDP ratio from 9.8 per cent in 1990-91 to 9.1 per cent in 1993-94 and further to 8.7 per cent in 1994-95 was mainly due to the abolition of the export subsidy following the 1991 devaluation, and partly due to the lower grants given to the states. There has been hardly any significant compression of revenue expenditures on centre's own account. In fact, a careful analysis shows a steadily increasing slope of the revenue expenditure curve has been the principal reason for the increasing gap between current revenues and expenditures as far back as 1979-80. After 1991, the revenue expenditure curve has become even steeper and the gap has widened further (Figure 1).

Even if we were to believe that there has been some deceleration in the growth of these expenditures, it would be erroneous to infer that there is no scope for further reductions if there had been a lot of overspending earlier. The revenue expenditures during the 1980s increased at 18.3 per cent

TABLE 2: GROWTH OF REVENUES AND EXPENDITURES

(Per Cent)

Item of Revenue/Expenditure	1970-71 to 1980-81	1981-82 to 1990-91	1970-71 to 1990-91
1 Direct taxes	12.4	12.5	12.5
2 Indirect taxes	16.1	16.2	16.2
3 Total tax revenue	15.4	15.6	15.5
4 Non-tax revenue	14.2	13.0	13.6

CENTRE FOR DEVELOPMENT STUDIES
U.P. Academy of Administration, Nainital

Announces *One Week Interactive Learning* on

SERVICE AND ACCOUNT RULES

based on

FULLY COMPUTERISED MENU-DRIVEN COMPILATIONS

Inquiry Officers, Decision makers, Administrators, Practising Lawyers, Judicial Officers/ Adjudicators
No need to delve into stack of Books/Guard files/Case Laws. Avoid unnecessary Litigations and Inquiries.

CDS creates an *innovative* system which helps you in updating your knowledge on Service Rules, Disciplinary matters, Accounting Rules, as well as facilitate quick retrieval/ reference of Government Orders/ Case Laws/ Court Rulings on any aspect of these matters. Using highly participatory computer-based learning systems, (*in Hindi & English*), One week interactive learning provides a comprehensive and complete exposure to user-freindly, menu-driven fully computerised up-to-date compilations. Expertise on computer NOT required.

Programme Dates: 9th Oct.-14th Oct./ 13th Nov. - 18th Nov./ 27th Nov. - 2nd Dec./ 4th - 9th Dec.1995
Fee : Rs 3,750.00 for U.P.Govt. Departments/ PSUs and Rs 7,500.00 for Other Institutions/ Professionals
(Fee inclusive of Boarding & Lodging charges, and a set of software floppies)

Inquiries or Nominations, alongwith a Bank Draft drawn in favour of 'Centre for Development Studies, Nainital' may be sent to **The Secretary, Centre for Development Studies, U.P. Academy of Administration, Nainital - 263 001. Tel: 3149; 3068; 2011 Fax: + 05942 - 3260**

Technology Informatics Design Endeavour
Development Research Foundation

Bangalore

DEVELOPMENT RESEARCH FOUNDATION

TIDE-DRF was established in 1994 and became fully operational in 1995 as an independent, non-profit organisation concerned with research in different aspects of the development process of developing societies. An important objective of the DRF is to provide research support to non-government development organisations and other bodies. It gives support also to the technology diffusion activities of TIDE. DRF is currently working on several research projects funded by well known international agencies.

DRF has a small core of highly qualified professionals, with doctoral level qualifications in economics, management, and related disciplines, and a well equipped office with good computer and other facilities. DRF also has access to excellent libraries and provides a congenial work environment.

DRF is looking for a Deputy Director to look after day to day functions in addition to taking responsibility for some of the major research projects underway. We are looking for a person with doctoral level qualifications in any related discipline, with demonstrated competence for independent research, and an interest in pursuing a research career, around 35 years of age.

Remuneration will not be a constraint for the right person. In the first instance, the appointment will be for one year; persons interested in deputation, sabbaticals etc. may also apply.

Please write in confidence to: The Secretary, **TIDE-DRF**, S.V. Complex, 55 K.R. Road, Basavangudi, Bangalore 560 004 or call N. Sampath Kumar at 080-6618401, fax 080-6619391 or e-mail sampath@tide.frlht.ernet.in

Secretary, TIDE-DRF

4th Sept '95

per year on the average, up from 15 per cent recorded in the 1970s (Table 2). Numerous studies have shown that there is not only much scope, but also an imperative need to reduce expenditures substantially on wages and salaries, subsidies and transfers [Chelliah 1992; Mundle and Mukhopadhyay 1993; Rao and Sen 1993].

There are also a number of centrally-sponsored projects taken up for populist reasons but not well targeted to the intended beneficiaries which need to be restructured.[3] One source of growth in expenditures has been through the proliferation of these centrally-sponsored schemes. The consequence of this is not merely in increasing public dissavings and widening fiscal deficits, but also expenditure centralisation, distortion of the states' expenditure priorities and inefficiencies in the delivery of public services. In fact, in the 1995-96 budget, the central government has used its expenditure policies and control over financial institutions to interfere over a wide variety of areas which should legitimately fall into the states' domain. Examples include directing NABARD to open exclusive lines of credit to co-operatives and regional rural banks to meet the credit needs of Scheduled Castes and Tribes amounting to Rs 500 crore, directing the banking system to lend Rs 1,000 crore on a consortium basis to Khadi and Village Industries Commission for on-lending to khadi and village industry units, setting up specialised bank branches in 85 identified districts to channelise the flow of credit to them, expansion of the centrally-sponsored schemes on Indira Awas Yojana and the creation of a National Social Assistance Scheme to give old age pensions, (a scheme which already exists in almost all the states) and provision of midday meals for the school children. The important questions that arise are, whether these schemes likely to make a lasting change in the poverty situation, will these be well designed and targeted to reach the intended beneficiaries, and if the central government better suited to incur expenditure on these activities.

If further reductions in the fiscal deficit are to be achieved only by raising more tax revenues and by privatising public enterprises, it is necessary to consider seriously the scope for and implications of raising additional revenues by improving the tax system. It must be noted first that the tax-GNP ratio in India compares favourably with those of the developing countries though the composition has been considered undesirable, with an overwhelming proportion accruing from indirect taxes. Related to this is the need to improve the income elasticity of the tax system, to impart a measure of stability to the tax regime, and to reduce discretionary changes in the tax base and rates from year to year to meet exigencies of additional revenue. It is also necessary to employ customs duties more as a protective device and less as an instrument to raise revenue. The reforms of domestic indirect taxes should simplify the structure by reducing rate differentiation, providing tax credits on inputs and capital goods, and reducing the distortions by extending tax to the retail level. Thus, while an emphasis on tax reforms is in order, the objective should be to evolve a stable, simple, productive and less distortionary tax system rather than simply to raise more revenues. Such a strategy would be in conformity with the broad objective of economic reforms, i e, of imparting greater competitiveness to the economy.

FIGURE 2: REVENUE RECEIPTS AND REVENUE EXPENDITURES OF STATE GOVERNMENTS

Dist Hooghly

This is not to imply that increasing revenue is not a feasible option. In fact, failure to recover user costs on many of the quasi public goods provided by the government has been a major source of implicit subsidy, and as the accessibility of these services is poorly targeted, the subsidy accrues predominantly to the better off sections of society. In asserting its priority areas for reducing the fiscal deficit, this CEM lost an opportunity to identify the candidates for higher cost recovery and to indicate the appropriate strategy for cost recovery.

As already mentioned, the state governments have a predominant role in the supply and regulation of social and economic infrastructures. Cost-efficient provision of these services responding to the needs and preferences of different regions is essential to achieve impart competitiveness to the economy. In particular, human resource development which is critical in accelerating the growth process is almost entirely in the states' domain (over 85 per cent of public expenditures is incurred by them) and fiscal and institutional problems at the state level could pose a binding constraint on the provision of these services. Similarly, the method of financing expenditures by the states can affect the allocation of resources by the private sector and therefore, can be an important factor in determining the competitiveness of the economy. It is interesting to examine to what extent the CEM's observations on the fiscal performance of the states and the solutions suggested therein would help in the structural adjustment programme.

A careful reading of the CEM indicates that many of its observations are not based on a careful analysis of state finances but are grounded in casual observation. It notes with concern the steadily increasing share of current expenditures and declining proportion of capital expenditures during the period, 1986-94. This and the increasing interest burden was enough for the CEM to conclude that the states will not be able to sustain their current pattern of expenditure. Of course, if significant increases in allocations to human resource development are made, as have been announced by the policy-makers from time to time, the share of recurrent expenditure will show a further increase and if these are financed from market borrowing, *ceteris paribus*, the interest burden will also increase. Can the question of sustainability be decided on such casual empirical facts? The simplistic nature of the analysis comes out even more clearly in its recommendations that in order to improve their public savings, the states should reduce their fiscal deficits. We have already indicated the nebulous nature of the relationship between public savings and fiscal deficits. What is more, in the case of the states, the volume of borrowing is, in effect, determined by the central government.

Even more disturbing is the assertion of the CEM that the constraint on states' finances is not due to a crisis of overspending, but their inability to effect improvements in raising own revenue. The only evidence offered to support this assertion is the fact

that the states, in the aggregate, could mobilise only 28 3 per cent of the additional resource mobilisation (ARM) targeted for the Eighth Plan period. Those familiar with the Plan financing table can easily understand that the concept as measured is not only nebulous but can even be misleading and to draw inferences on the states' revenue effort based on such a measure could lead to erroneous conclusions.

First, it is politically appealing to draw up unrealistically large sized plans and as the states' fiscal position cannot generate an adequate balance from current revenues, unrealistic ARM targets are set. In drawing up large sized plans without resource support, the Planning Commission as much as the individual state governments must take the blame. Second, the method of estimating the yearly targets of ARM is unscientific. The change in the tax rate is assumed to generate proportional changes in tax revenues. Third, as fulfilling these targets has become increasingly difficult, all sorts of things were included under ARM, even the money saved due to the delayed dearness allowance payments to employees Finally, the concept of ARM itself introduces instability to the fiscal regime. Revenue performance should be measured in terms of revenue productivity of the tax system and not by how much revenues were generated by effecting changes in the tax base and rate structure year after year. In fact, such discretionary changes can reduce the long run productivity of the tax system and the unstable tax structure can distort the decisions of the economic agents Past experience shows that, in the name of ARM, revenues were raised without any regard to their harmful economic effects. Surely, such measures cannot add to the competitiveness of the Indian economy.

A careful analysis of the fiscal performance of the states does not support the assertion that fiscal imbalances have arisen mainly due to poor revenue efforts and that overspending is not a problem. In fact, the average annual growth of states' own revenues accelerated from 13.9 per cent in the latter half of the 1970s to 15.4 per cent in the 1980s and further to 16.7 per cent in the first four years of the 1990s (Table 3). The states' own tax revenue, after accelerating to about 16 per cent in the 1980s fell only marginally to 15 6 per cent in the first four years of the current decade despite the low GDP growth rates during this period. In contrast, the growth of revenue expenditures outpaced the growth of revenue receipts throughout the 1980s, and even in the four years of fiscal adjustment it remained higher than the growth of states' own tax revenues. These trends brought out in Figure 2, clearly show that the divergence between current revenues and expenditures is mainly caused by the increasing slope of revenue expenditure curve and this became even more pronounced in the 1990s. Thus, contrary to the assertion in the CEM, fiscal imbalance at the state level seems to be mainly due to the crisis of overspending and not to stagnancy in revenues.

However, it would be incorrect to infer from the above that there are no problems in the states' methods of raising revenues. The inefficiencies of the states' tax system, particularly the domestic trade taxes have been widely discussed in the recent past and it is not necessary to go into the details here [NIPFP 1994; Rao and Vaillancourt 1994] The objective of tax reform should be to remove the inefficiencies in the tax system and to minimise resource distortions arising from it with a view to imparting greater competitiveness to the market. Again, improving the long run revenue productivity of the tax system should be the objective. Of course, there is a lot of scope for enhancing user charges and fees on many of the quasi-public services provided by the state governments and much of the increases in non-tax revenues since the beginning of the reforms was achieved by taking credit of larger interest receipts from public enterprises and not by realising user charges.

IV
Implications of World Bank Prescriptions

Realistic assessment of the problems and prescriptions based on them should lead the policy-makers to adopt the right set of measures for fiscal adjustment. In fact, the government can actually use the World Bank's prescriptions as a lever to carry out reforms which are politically difficult to implement However, inappropriate policy prescriptions based on wrong diagnosis of the issues can encourage laxity in fiscal management and defeat the very purpose of stabilisation and structural adjustment.

As shown in the previous section, a careful empirical analysis of the trends in revenues and expenditures of the central and state governments does not lend support to many of the conclusions reached in the CEM. While it rightly draws attention to the need to improve public savings, the emphasis is on containing the fiscal deficit. Moreover, the CEM's assertion that there is no further scope for expenditure compression and that in order to further reduce the fiscal deficit, tax revenues should be raised is not based on sound analysis. Such a prescription can encourage vested interests to seek and obtain large increases in allocations with benefits largely accruing to them and thus engender a spate of spending by the central government for electoral reasons. It is not surprising that there has indeed been a spurt in spending on interim relief (Rs 1,500 crore) to government employees, area development programme for the members of parliament (Rs 790 crore), new social assistance schemes (Rs 1,500 crore). Many more such schemes are likely to crop up with the elections scheduled next year.

The diagnosis of the fiscal problems at the state level in the CEM is also simplistic. Here again, the fiscal problems are attributed not to "the crisis of overspending.... but to the absence of improvements in the own revenue efforts of States as a group" (p 40). In the event, apparently not even the states need be concerned with the difficult task of reducing expenditures, and in a world of competitive populism they can go on a spending spree. The CEM, like the Planning Commission, seems to think that raising more and more resources and not increasing the efficiency in resource use should receive priority. This option may be easier to implement, but the solution may not serve the objective of structural adjustment.

Notes

1 The CEM interchanges these percentages perhaps due to an oversight

2 The CEM wrongly states that the Ninth Finance Commission actually adopted such an approach determine the awards for the special category states In fact, the commission used both shortfall in fiscal capacity and cost disabilities in determining the transfers of major states and not special category states

3 There were 262 centrally-sponsored schemes in 1989 Although the working group appointed by the Planning Commission recommended the abolition of a number of schemes, most of them have continued and the new ones have been added to the list

On Drinking and 'Drunkenness'

History of Liquor in Colonial India

Indra Munshi Saldanha

The extent of impingement of the colonial state upon what may be called the private, collective domain is well illustrated by the policy of the British government on indigenous liquor making and drinking. This article dwells upon two important legislations, the Bombay Abkari Act, 1878 and the Mhowra Act of 1892, and their effect on the customary practices of the adivasis in the Thana district of Bombay Presidency. It also discusses overt and covert resistance of the communities and the classes which were involved both for and against the policy.

I
Introduction

THE British liquor policy was guided, avowedly, by the twin objects of generating revenue on the one hand, and checking intemperance among people towards safeguarding their morality, on the other. State policy, however, often came into conflict with another morality, that of the peasants, especially the adivasis (tribals), for whom drinking formed an integral part of their material as well as symbolic reality. It is an area of investigation, although largely neglected, which illustrates the impingement of the state upon, what may be generally called the private, collective domain of liquor making and drinking, and the resistance, both overt and covert, of the communities against the state as also the classes involved. Foucault's observation is extremely relevant in this regard, that "aside from torture and execution, which preclude any resistance, no matter how terrifying a given system may be, there always remain the possibility of resistance, disobedience and oppositional groupings [Rabinow 1987:245].

In this paper, the British liquor policy is discussed with reference to two important legislations, the Bombay Abkari Act of 1878 and the Mhowra Act of 1892, and their effect on the customary drinking practices of the adivasis, in particular in one district, Thana of Bombay presidency (present-day Maharashtra). The debates and discussions around the legislations and the crucial issues opened up by them demonstrate that the colonial discourse was not monolithic. The two legislations, however, had the summary effect of blocking the major sources of liquor-toddy, the fermented/distilled juice of palm tree, and mahua drink made from the flowers of *Bassia latifolia*[1] – by taxing the former beyond the means of the poor and banning the latter. The new system opened up an important source of revenue for the government. Towards the close of the period, revenue from excise (most of which came from country liquor) was second in importance only to land revenue. It also gave rise to a class of capitalists for whom manufacture of liquor became an extremely lucrative business. In the emerging market economy liquor, too, could be had for money, lacking which, even land and labour. Given the persistance of semi-feudal relations of production, liquor became an instrument of exploitation of the poor.

Neither the zeal of the government, nor the temperance movement, nor even the Indian-social reformers radically altered the adivasis' attitude towards drinking. They continued to drink, but in the changed situation, more expensive and less healthy liquor. The more popular and widespread alternative, however, was to distil liquor illegally. As the laws became more stringent and the prices rose, the peasants resorted to smuggling, illicit distillation and other acts which came to be termed 'crimes' and 'offences' in the legal discourse. While the government succeeded in fulfilling its object of raising revenue from liquor which, as we shall see, showed a steady increase throughout the period, the second object of checking consumption did not show much success. The fact that the peasants, especially the adivasis, continued to drink, raises basic questions about the very assumptions on which the liquor policy was formulated.

II
British Concern: The Early Years

The system that was continued in Thana district, long after the British took over the district in 1818, was the levy of the 'buddene' cess on palm trees, the proceeds of which was credited to land revenue. It was a cess levied as assessment to land revenue on toddy producing trees. It gave the payer the sole right to the trees, fruits, leaves and juice. Except in a few cases, the payment of this cess under certain conditions entitled the payer to draw and distil palm juice without any further charge. The details of the arrangement varied greatly in different parts of the district. In some parts, for example, Salsette, monopoly of the retail sale of palm juice and other country liquor was annually sold by auction, and it was only to the monopolists that the payers of the buddene and tapping cesses could sell palm juice. Payers of the buddene were allowed to draw, distil and sell to the monopolist on payment of an additional cess. No tapping licence was granted for fewer than 15 trees. In Dahanu and other parts any landholder or any person owning trees enough to represent a tree cess of Rs 10, could, on paying a further sum of Re 1, get a licence to distil and sell liquor within the limits of his village. Persons who were unwilling to obtain distilling licence could tap the trees and sell the juice only to the holders of a distilling licence. This was the case in the subdivisions along the coast where palm trees grew in greater abundance [RD6 1883:4].

In the inland subdivisions, Kalyan, Bhiwandi, Vada, Sahapur, Karjat, where palm trees were fewer, most of the liquor consumed was made from mahua flowers. The right to distil and retain mahua liquor in certain tracts or groups of villages was annually sold by auction. A tree cess was levied on all palms tapped for liquor in these parts, but the payer was forbidden to sell the produce to anyone but the liquor farmer [RD6.1883:4].

The revenue from liquor was, therefore, generally raised by auctioning the monopoly of the right to manufacture and sell liquor over a specified area.[2] Each farm usually comprised only a few villages. The farmers paid a lump sum for their privileges and were then free to make and sell as much liquor of as many kinds and strengths as they pleased uncontrolled by official interference. The farming system was, however, found to have serious weaknesses. It was argued that it left both government and consumers at the mercy of the farmers. The government could only realise in any year just as much revenue as the farmer chose to guarantee, and farmers often combined to keep down prices at the auction sales. It left the government ignorant of the quantities of liquor made and consumed, of the cost of manufacture, of the rates of duty realised on it, the strength and the selling price of the liquor sold and of the amounts of the profits derived by the monopolists from their farms [Report I,

1924:44]. In the district most liquor farmers were Parsis.

The result of this system was seen to be unsatisfactory for other reasons too. The officials found it impossible to supervise the countless stills that were at work all over the district. The abundance of spirit and the low rate of the excise, they asserted, made liquor so cheap that "drunkenness was universal" [RD6 1883:4-5]. In addition, it was observed, a marked increase of smuggling followed the enhanced excise rates which were introduced into the town and island of Bombay in 1874. The system was ineffective in that it provided ample scope for evasion of revenue. The policy of centralisation was already under consideration. In 1859, central distilleries were ordered to be established all over the country, so that a closer control and supervision could be maintained. The need of a more efficient system was recognised and finally introduced in 1879. The justification for the reform, which, as we shall see, created much discontent among the people, was provided by the need to check 'excessive drinking' For example, John Nugent, assistant collector of Thana, observed in 1868 that whereas 30 years ago only 10 per cent of the population habitually drank, it had increased to 75 per cent, and even 90 per cent in some parts. The greater facilities afforded for obtaining liquor than before led to higher consumption [Report I 1924: 43].

The district, along with other coastal districts, appears to have acquired a reputation for 'extreme intemperance'. As early as 1826, the collector was so alarmed by the widespread 'gross intoxication', that he thought it advisable "to cut down all but a few of the liquor-yielding trees". Again in 1863, the commissioner proposed that all palm trees on government waste lands should be cut down as the use of the liquor drawn from them was so demoralising. The proposal was repeated in the following years [RD 6, 1883:8-9] [1] The reasons for it were found to be in the abundance of palm trees on the coast and of mahua trees in the interior, the dampness of the climate, but most important, in the old lax abkari systems which made cheap liquor easily available

III
Abkari Act V of 1878

The task of introducing a new system was entrusted to C B Pritchard who was serving as collector of Salt Revenue and supervisor of the distilleries at Uran in Thana district in 1875. His recommendations were embodied in Act V of 1878 and the new system was introduced from January 1, 1879 The main principles of the reform were to confine the manufacture of mahua spirit to central distilleries, that excise duty be levied on this liquor before it left the distillery, and that no toddy be drawn from trees except by permission and under licence, that for each toddy tree tapped tax under excise (rather than land revenue, as had been the case of earlier) be paid and that liquor and toddy be sold in licensed shops, with licences auctioned as before. These measures were to be introduced gradually over a number of years [Hardiman 1985:189]. The plan was to raise the palm tax annually so that the mahua spirit manufactured in central distilleries would finally replace the distilled toddy liquor Pritchard was appointed as the first abkari commissioner for Bombay presidency in 1878

Under the act, with a separate department and sufficient staff, the abkari system in Bombay presidency was revolutionised. The old farming system was abolished nearly everywhere, the central distillery system with high rates of duty varying in each district, which were steadily increased from time to time, being introduced in its place. This system was accompanied with the grant of moopolies and a 'minimum guarantee' the amount of which was fixed by competition With the help of a large staff as well as the increased power of the magistrate to punish the offender, greater control by the government could now be established.

The result was a general discontent among the distiller and the people. The majority of the tree owners of Thana refused to pay the tax in protest A large number, nearly 1,10,000, trees remained untapped, owing to the prohibitive tax of from Rs 3 to Rs 14 on each coconut tree, Rs 3 to Rs 12 on each brab and Rs 1 8 to Rs 4 on each date tree in the different subdivisions, as well as to the grant of a monopoly of drawing and selling toddy to the liquor contractor [RD6A, 1883:3]. Under the new system toddy could be tapped only by those holding a licence from the government Licences were given to those who took the largest number of trees for tapping. The bhandaris, the traditional tappers and distillers of toddy, complained bitterly that the enforcement of the provisions of the new act had driven them out of occupation. The tax of Rs 10 per brab tree was found oppressive. They could not draw toddy from a small number of trees, and none of them were rich enough to take 50 palm trees, the minimum number fixed by the act. The government had, they petitioned, sold by contract the monopoly of manufacturing and selling liquor to "rich and cruel contractors who have made us their slaves" [RD6 1881:188, 251, 267]. They pleaded that the tree tax be levied from them directly, that they be permitted to tap the trees and sell the produce independently of the liquor contractor, and the present restriction of issuing licence for tapping trees to men approved by the contractor be dispensed with. The government, regretting that they had been deprived of their former occupation and however suggested that they turn to another employment if they had none [RD6 1881:217].

The assumption underlying Pritchard's proposal was that by raising the price of liquor, 'undue consumption' could be checked and at the same time a 'fair revenue' from the excise of liquor could be realised [RDI 1879:45], the principle being that a maximum of revenue should be raised from a minimum consumption of intoxicating liquors. In an attempt to vindicat his stand, Pritchard stated in 1979, "... the measures just advocated are likely to be beneficial to the people as well as to the revenue, that the increase made during the current year in the selling price of liquor in many talukas of Thana coupled with the prohibition of indiscriminate distillation has had the most marked and gratifying effect on the condition of the warlis and other labouring classes. The collector of Thana has informed me that these people are universally reputed to be now more industrious and more capable of hard work and willing to do it than formerly when half their time was spent under the influence of drink ..[RDI 1899:48-59].

The 'mamlatdar' (revenue official) of Karjat who was familiar with the district had however, the following observations to make on the effect of the legislation on the people. "Now the price of liquor being very dear, more illicit liquor is distilled and drunk. Formerly people used to purchase a bottle of liquor at from two to four annas and the illicit liquor now distilled costs the illicit distiller the same expense for manufacturing it... experience teaches me that drinking is more common than before." Moreover, he found that those who had no means to distil illicit liquor had resorted to more petty thefts of paddy, rice, etc, than before. Earlier they used to put aside a portion of their wages sufficient for the maintenance of their families, but now, as they had to spend a large amount of their wages for procuring the quantity of liquor barely sufficient for their requirements, they were led to acquire money by other means [RDI 1879:49]. If the rate of tax on palm trees was reduced, he suggested, people would have less inducement to attempt tapping without permission for illicit distillation. In his opinion, those who engaged in illicit tapping did so 'only to maintain themselves'. Therefore, if the rate of tax and the price at which licit liquor was sold were reduced, illicit distillation would stop (Ibid:52). Many private persons as well as government officials held this view (RD6 1883).

It was argued by the rayats (cultivators) and owners of toddy trees in the district that the poor, for whom toddy served as an article

of food, were being deprived of a source of sustenance.[4] In times of scarcity and famine, toddy had served as a substitute for food and helped them tide over difficult times. The high price of toddy would drive people to harder and more harmful liquors like mahua. They also pointed to the evils of the new liquor monopoly system which supplanted the former liquor contractors who took contracts for limited areas in favour of large capitalists who alone could bid for the large areas consisting of several talukas that were put up for auction. In addition, in the absence of competition, these contractors could have a relatively free hand with regard to both quality and price of toddy [RD6A, 1883:4-5].

Around the same time a British official, F S P Lely, assistant collector of Surat district, launched a powerful critique of the official policy, highlighting the hardships it had caused the poor adivasi peasants and labourers in his district. "... I submit that it is not in the power of any government to enforce the remedy of the teetotalism without entailing worse evils. The attempt to do so by a prohibitive tax has only deprived the women and children of much of their already scanty provision of food, clothes, and salt. ... It cannot be denied that a fair amount of toddy acts, if not as food, yet as compensation for the want of it. It cannot be denied that if not a medicine, yet it is properly believed to be such." Should not a moderate legitimate supply be placed within the reach of the people, he rhetorically asked [RD9, 1884:215].

In 1886, he wrote, ". . the change of 1879 was a small social revolution in that it drove the people out of the fields to the shop. Previously, every man who had trees in his fields, tapped them and gave thereof to his acquaintances with little fear of the farmer who asked no questions. No doubt they often drank more than was good for them, but at any rate it was sound juice taken straight from the tree and only half fermented. The customers at the shops were, as a rule, strangers and travellers only. Upon such a state of things fell the order that no toddy was to be got except at a licensed place, and not even there without payment of cash. To a people whose wages were one anna per day paid in kind, this was really a prohibition, except on very rare occasions. It made no practical difference to them whether the price was two pice per pint or twenty. Both rates were hopelessly beyond their reach" [Quoted in Hardiman 1985:194].

The official concern with the widespread consumption of illicit liquor led to determined efforts by government for the repression of illicit distillation in the inland talukas by the establishment of punitive police posts in many of the villages in which illicit distillation was most rampant and by the infliction of exemplary and determined punishments upon persons convicted of offences against the abkari law [Statement 1905:2]. In spite of these measures, illicit distillation was rife in almost every village in the inland talukas where the mahua grew in abundance. It was easier to make liquor from mahua than to tap toddy since the pot hanging on the trunk could easily be detected.

The abkari officials were alarmed at the organised resistance to the abkari laws. The people discovered ingenious ways to escape detection, for example the pot with fermenting mahua was kept in fields away from the villages, the stills were set up in ravines and 'nallas' and men were posted to give warning. As Sibbald, inspector of the inland range, pointed out, since the apparatus was found in open grounds, no one could be held responsible for it [RD6 1883:10]. The abkari inspectors continued to complain that villager as a body were involved in the 'crime'. No one gave any information. The actual manufacture was carried on on some remote spot, the same spot being seldom used more than a few times. The villagers often offered an organised and determined opposition to the abkari force. There were instances of abkari men being brutally handled by villagers, of being beaten and even killed [RD9 1891.55; RD6 1883.10].

In a large number of instances, Atkins, the assistant collector of Thana in 1883, reported, women and old men were found at the stills, and therefore convicted under the Abkari Act. He believed that it was widespread probably because "The old man, if sent to prison, is unfit to do hard labour and does not much mind simple imprisonment when he is paid for it." The woman often gets off with a heavy fine but her fellow villagers subscribe and pay it as a kind of part payment for the liquor they had during the year [RD33 1884:185]. Atkins described the trial of an old man who had been twice previously convicted, and who was now sent to prison for six months. The man greeted the magistrate, "Ram Ram, Rao Sahib", and went to prison happily. Even the most severe punishment, he felt, seemed to have no effect. He touched on a sensitive issue when he observed that "the morality of a class is subject only to the opinion of that class" and that the public opinion of the cultivating class was not opposed to the illicit distillation of liquor [RD33 1884:186]. Given the strong community support, he felt, it was almost impossible to find the offenders. Even a large abkari staff would find it difficult to be constantly searching houses, hollow trees and other hiding places in forests, holes in the ground, nulla beds and haystacks [RD33 1884:185].

The licensee, too, was expected to employ a sufficient private preventive establishment to put down all illicit liquor traffic within the limits of his farm, so as to control entire licit consumption in the region [RD4 1884:216]. Despite the contractor, illicit manufacture of liquor became more and more popular as the price of liquor went up over the years. From the villager's point of view, it was well worth the risk since he managed to get for almost nothing a bottle of spirit that would cost him 8 to 9 annas in the shop. The operation was a simple one, requiring little more than household utensils and a few pice. Alternately, liquor could be smuggled from the neighbouring princely states of Jawhar and Dharampur and the Portuguese territory, Daman, where generally the price of liquor was lower.

Atkins was clearly of the opinion that poor cultivators needed liquor at the end of a hard day's labour in the field during the rains, primarily for health reasons. They only got bad liquor, at a high price and that too after walking eight to 10 miles. They naturally preferred to make their own liquor. If, however, they could get good liquor at an affordable price, and within a mile or two of where they lived setting up a 'private' still would not be necessary. As for the argument that this would "corrupt the morals of the people", Atkins felt certain that people would not consume more liquor than they did now – they probably drank more than wanted simply because it was available at home [RD33 1884.186].

Mhowra Act (III of 1892)

In order to check illicit manufacture which caused 'loss of abkari revenues' as well as encouraged 'lawlessness' in the inland talukas where mahua trees were plentiful (mahua flowers were also imported from Gujarat for the same purpose), Charles Pritchard proposed that the collection and sale of mahua flowers be banned. To this effect, the Mhowra Bill was introduced in the Bombay legislative council in 1882. But while under discussion it was fiercely opposed by the non-official members among whom were eminent persons like Rao Saheb Mandlik, Sir Jamshetji Jeejibhai, W M Macaulay, S D Sasson and others. They argued that mahua flowers were used as food by the poor for themselves and for their cattle during periods of scarcity. And that no "increase of the abkari revenue would compensate for the injury that would be inflicted on the very poorest classes by depriving them of an article of sale and barter which has been provided for them by the bounty of nature and which they have freely collected from immemorial time" [QJPSS 17, 4 1895:9, see also QJPSS 14, 4 1892:1-73]. They blamed the abkari department for, "driving people to illicit distillation". Since raw toddy had been made

dear and scarce, and licit liquor heavily overtaxed, people took to illicit liquor. The remedy, it was suggested, was "not an oppressive restriction of the free use of useful articles but a reduction of high taxation" [QJPSS 1892:72]. Without mincing words, W M Macaulay observed "it seems to be that the Abkari Act of 1878 and the bill now before us have been framed with one object of increasing revenue" [QJPSS 1895, op cit:9].

It was forcefully argued that the restrictions contemplated would press hard on the poor and tribals who were generally engaged in the collection of mahua flowers. These flowers served as casual, if not regular, food for men, fodder for the cattle, and as medicine. The entire families of the tribals in the district, the kolis, katkaris, warlis, dublas, thakurs and others collected the flowers that fell on the ground of which they kept a share for themselves, and sold the rest to the bania for grain or money [QJPSS 1892, op cit:14]. The supporters of the bill replied that 'when the results are so disastrous to the peace and morality of the country, it is impossible not to interfere with it, even if it is admitted to be a food'. And that when freedom caused the 'demoralisation' of the people, it was necessary to interfere because it was impossible otherwise to check 'drunkenness' and at the same time prevent a serious loss of revenue from illicit distillation [QJPSS 1892:23]. Surprisingly, although the government admitted that mahua flower was used as food in Gujarat and Khandesh and other parts, it persistently asserted that it was not so used in Thana and Kolaba districts alone.[5] As a result, however, of the opposition to the proposed bill, it was vetoed by the government of India under Lord Ripon in 1882.

In accordance with the instructions from the government of India, the Bombay government appointed a committee to further inquire as to whether the high rate of duty charged on licit spirit in the district of Thana and Kolaba had not encouraged smuggling and whether the mahua flower was ever used as food in those districts. A committee consisting of three revenue officials of Bombay was appointed and their conclusions were as expected, in conformity with the government's position. It noted that the high rate of duty on licit spirit was not the cause of smuggling in the two districts, that mahua was not a staple article of food of the people, neither was it generally given, to any appreciable extent, to cattle. Finally, that the only way to check the evil of illicit distillation was to bring the free traffic in mahua flowers under legislative control. They even proposed the cutting down of all mahua trees. On the other hand, a large number of witnesses, the lower level officials as well as non-officials, stated that the flowers were used by the poor, especially the adivasis, as food for men and cattle when their stock of grain was exhausted, and especially in famine times. The flowers were eaten fresh or dried, by themselves or mixed with grain flour and made into bread. Oil extracted from mahua seed was used for purposes of consumption as well as lighting. It was clear that the poor also bartered the mahua flowers for gram, rice or other miscellaneous items of grocery, on which they subsisted during the monsoon months. It was also pointed out that formerly because the peasants derived benefit from mahua, they planted more trees. But in recent times given the changed circumstances they were trying to fell the existing trees and sell them off [RD6 1883].

The bill was turned down once again in 1884. But in 1892, Pritchard took up the matter again and the act was finally passed by the Bombay legislative council. It was applied initially only to the Thana and Kolaba districts. He put forward a proposal whereby a vacation would be granted from the mahua controls between February 15 and April 15 every year. The rest of the time the storing and selling of mahua was to be banned. The act was said to be necessitated by a 'very serious' rise that had 'recently' taken place in the illicit distillation of mahua in Thana and Kolaba districts. In his closing speech Pritchard clearly stated that he was "unable to hold the view that the liquor traffic was not a legitimate source of revenue" [Report I, 1924:45].

The act evoked much disapproval from several quarters. Public meetings to protest against it were reported to have been held all over the two districts. The press, both English and vernacular, was involved in the debate that followed the passing of the act. The Poona Sarvajanik Sabha, a nationalist organisation, took up the issue seriously. It argued that nothing had happened between 1882 and 1892 which could justify the acceptance of the legislation. The 'very serious rise' in illicit distillation, which the government used as a justification, was due to an experiment made by the government in 1887-88 which took off some of the restrictions on raw toddy, but at the same time enhanced the price of licit liquor. The experiment was pronounced as 'disastrous' by the department and discontinued at the end of 1889 [QJPSS 15,2, October 1892:36]. It further argued that compared with the figures of 1880-81 and 1881-82, the figures of illicit distillation in recent years did not show a 'serious rise', but on the contrary, a substantial drop. In support of the argument it was shown that the abkari offences connected with illicit distillation detected were 612 during 1880-81, 767 during 1881-82, 492 during 1889-90 and 408 in 1890-91. During 1888-89 the period of the experiment, they showed a high of 606 [QJPSS April 1892:55]. And that since the abolition of the experiment, the number of offences had been steadily and rapidly diminishing, much to the satisfaction of the abkari department officials. In the opinion of the Sabha, the legislation would deprive the poor of an article which although not a staple article of food was an important supplement to foodgrains. Besides, it would invest the police with even greater power to harass and blackmail people (QJPSS 15,2 October 1892:39-41].

In the 1889 abkari officers in Thana were unanimous in admitting that their efforts to stamp out the 'recent excess' of illicit distillation had been ineffectual. They were generally of the opinion that there were only two ways of putting down illicit distillation by reducing the price of licit liquor or by bringing possession of mahua flowers under effective control. It is evident from the Commissioner's letter of May 9, 1889, that the chief cause of illicit distillation of both mahua and toddy, in his opinion, was the raising of the retail selling price of country spirit to rates that the main body of consumers could not pay. To check the evil, he suggested, the first step to be taken was "to reduce the retail selling prices of country spirit that have risen to rates ranging from 50-100 per cent above prevailing in 1886-87" [RD 2A 1889:26, 79].

The government, rather than reduce the price of licit liquor, chose the other alternative, to control the possession and sale of mahua flowers so as not to jeopardise its revenue interests and passed the legislation under discussion.

Abkari Revenue and 'Offences'

After the year 1879, the revenue from country liquor showed a steady increase. The rate of still head duty on mahua spirit and the rate of tree tax on palm was raised from time to time, and while revenue increased substantially over the years, consumption does not seem to have decreased. At the same time 'offences' as also other forms of resistance to the liquor legislations, despite the severe punishment, continued unabated frustrating the efforts of the government.

In 1878-79 the revenue amounted to Rs 4,92,430. In 1880-81 the revenue had gone upto Rs 6,36,776 as a result of the introduction of the Abkari Act of 1878. The revenue increased to Rs 7,06,137 in 1883-84, but dropped to Rs 5,98,794 in 1889-89, as a result of the experiment referred to earlier. It increased to Rs 8,15,313 in 1893-94, Rs 10,02,259 in 1898-99, and showed a slight fall to Rs 9,82,966 in 1903-04 [Statement op cit, Thana: 2-7]. The official figures for consumption per head showed an overall increase. These, however,

do not reflect the actual amount of drinking given that a fair amount of liquor consumed was illicit and therefore, unaccounted. In 1881-82 the consumption per head was reported to be 19 drams, in 1883-84 it was 22.8 drams, it fell to 8.1 drams in 1888-89 as a result of the changes introduced by the government, mentioned above, which resulted in an enormous rise in prices and therefore to illicit distillation. (One dram is 1/48 of a gallon.) The consumption rose to 23.4 drams in 1893-94, 25.3 drams in 1898-99, and dropped to 20.8 drams per head in 1899-90 as a result of the effects of famine in the district. It rose again to 23.9 drams in 1903-04 and further to 26.7 drams in 1904-05, the highest on record and was attributed to the "return of prosperity".

The government pointed to the "large and steadily increasing abkari revenue" as an indication that people could afford to spend much on 'luxuries'. The more sensitive officials however argued that "the luxury of drinking some kind of spirit or intoxicant is the luxury *par excellence* not to say the necessity of the lowest and poorest classes in most countries" as was evident in the enormous revenue derived from the gin palaces in London and other cities in England. To the weakened, feeble frame of the Konkan rayat, it was pointed out, liquor was as comforting and had become as necessary as it was to the poorest in London [RD34 pt II 1884:17].

Before the century came to a close, however, Thana witnessed a major protest by the adivasis as well as other caste groups in which cheap liquor featured as one of the demands. The action was sparked by a forest regulation passed in 1896 which prohibited the collection for sale of firewood by the adivasis. It caused widespread discontent all over the district, and not only the adivasis, but many other groups, too, voiced their grievance against the government policy with respect to land, forest and abkari. As one official put it, it reopened many old sores connected with toddy, grazing, abkari regulations generally. Bhandaris, who felt deprived of their traditional occupation by the government's abkari policy, too joined the protest [RD 112 1897:45,77].

Abkari inspectors were alarmed at the resolutions passed in meetings to tap toddy trees without permits. The adivasis were reported to have asked the Christians of Bassein taluka to abstain from liquor as a form of protest [RD112 1897:80]. Among other things, people demanded that liquor be sold at one anna a bottle, and the palm tree tax be abolished. In one instance, it was reported in a local newspaper that people forced the acting district deputy collector to give an order for liquor to be sold at one anna a seer on a stamped paper. With this order they went to a liquor seller's shop and bought a large quantity of liquor at one anna per seer and consumed it on the spot (*Arunodaya* November 25, 1896). By 1896 the storm had blown over.

A different reaction from the people, discernible in this district, and much more in the adjoining districts of Gujarat, was collective abstention from liquor. Despite the lip-service paid to temperance by the government, its own response to the anti-liquor movement was often one of concern for the resulting loss of revenue. The feeling was expressed by the abkari commissioner in 1886, when there was a movement in favour of total abstinence in Thana and Kolaba districts. The movement was crushed and the commissioner justified his action in the following words "the question for decision is, shall we sit quiet and allow the movement to continue and to spread and thereby to forfeit a large amount of revenue, or are measures to be adopted, which will bring people to their senses" [Report I 1924:45].

To give up drinking liquor was a way out for the poor "to protect themselves from local coercion" as well as a reaction to the high price of liquor which was leading them to impoverishment. Parsi liquor shopkeepers were known to give liquor on credit and demand labour and even land in return. In 1882 *The Gazetteer* of the district recorded the presence of the Parsi landowners and liquor sellers in the interior villages. Frequent complaints were made against them by the adivasis that "these men press labour for the cultivation of their fields" [*Gazetteer* Thana 1882:247]. Oral testimonies from the adivasis reconstruct how the outsiders came and settled in their villages several decades ago, acquired a little land, opened liquor shops and often encouraged the adivasis to buy drink on credit. And after the debts increased, they would demand land or money. Since adivasis did not have the money, their lands were taken away and they were turned into tenants on their own land. In this way, the landlord would acquire entire villages. These stories are very much a part of the collective memory of the people. Liquor had become an instrument of exploitation of the adivasis by the high caste moneylender-landlords, particularly the Parsis. Field work in the region in 1981-82 generated substantial evidence to support this [Saldanha 1984:660].

In some instances, as in one taluka, Umbergaon, the brahmin landlords evicted tenants who had dealings with the mahua merchants or who themselves engaged in illicit distillation. The Parsi landlords, on the other hand, not burdened by brahminical values which consider liquor drinking as a vice, encouraged or even compelled their tenants to illicitly distil with a view to "enjoyment of the first outcome of the illicit stills" [RD9 1891:27-28].

In 1906 a temperance movement which started in south Gujarat spread to northern Thana. It was started by an educated adivasi in the tribal territory of south Gujarat. Mass meetings of the adivasis were held and vows were taken to abstain from liquor. There was a fall in sales of liquor and toddy and a remarkable decrease in the instances of illicit distillation [Hardiman 1985:213]. A large fall in sales was reported from Thana, too. As a result, the licensees in Thana suffered a loss [RAED 1906:6-9]. The movement was, however, short lived, and by 1906 a rise both in consumption and receipts was reported. In two talukas, Bassein and Bhiwandi the effects of the movement continued to be felt, but on the whole the situation was said to be 'normal'. In 1908, "a certain amount of sporadic agitation mainly of a political and quasi-political character in support of a temperance movement" was reported to have occurred in Thana. The movement took the form of propaganda by means of public meetings, but, by and large, in official view it remained 'spasmodic and ineffectual'. It appears to have been a part of the boycott of liquor shops in parts of Bombay city and several other districts of the presidency following the trial of the nationalist leader, Tilak.

After 1921 with Gandhi's blessings the anti-liquor campaign spread to many areas. In Bombay city the temperance activity was fairly strong. Supported by the Indian National Congress, the campaign was active in almost all parts of the Bombay presidency, resulting in fall in excise revenue. The government's attitude is clear from the statement that it was in sympathy with the measures directed to encourage temperance provided the methods adopted did not lead to 'inconvenience or annoyance' of the public, or to "interference in lawful vocation and the liberty of the subject" or to breaches of peace. The magistrate and the police were expected to take the necessary steps to prevent or punish infringement of the law [Report I 1924:47]. In the government's view, although the anti-liquor campaign was inspired by social and religious reformist ideas, it was very much a part of a political programme to discredit the government.

A most remarkable development, however, was the 'devi' movement which originated among the adivasis in a coastal taluka in Thana in 1922, and spread over south Gujarat. It appears to have started early in 1922 among the Mangela Koli fishermen who were hit by an epidemic of small pox. They believed that the goddess who had caused the epidemic had to be propitiated. Koli women would become possessed by the deity at ceremonies. Through this medium, the goddess let it be known that she would be satisfied if they gave up meat, fish, toddy,

liquor for some time. This propitiatory movement spread northwards to other fishing villages in Thana and then to Surat district [Hardiman 1984:208, see also Hardiman 1987]. It represented an attack on the abkari system as well as on the Parsi liquor and toddy dealers. During the course of the movement the influential section among the adivasis forged an alliance with the middle class Gandhian nationalists of Gujarat, who were the most vocal champions of the cause [Hardiman 1985:214]. The anti-liquor agitations continued to occur in the following years but sporadically and without any lasting effect.

Under the Montagu-Chelmsford reforms of 1919, the provincial abkari came under an elected minister. In Bombay the first elected minister was Sir Chunilal Mehta. He was committed to the cause of temperance. In 1922 he introduced the system of rationing of supplies to liquor shop, initially reduced by 5 per cent in the rural areas, to be further cut year after year. A committee was appointed in 1922 to look into the operation of liquor laws in the presidency with a view to report on whether complete prohibition could be implemented. The committee submitted its report in 1923. Opinions were divided between the government officials and liquor contractors, on the one hand, who favoured the existing policy, and the non-officials, on the other, who favoured either greater restriction or in many cases, complete prohibition. The masses, whose interest was claimed to be represented by the British officials were not however a party to the debate [Hardiman 1985:217].

Nevertheless, the committee came to the conclusion that the Indian people wanted prohibition. It therefore recommended the implementation of a policy of prohibition in Bombay presidency. The government responded by voicing its concern for the loss of excise revenue which formed nearly one-third of the total revenue of the presidency. It would be impossible for them to pursue the policy of prohibition unless the loss of revenue arising out of it was "completely made good from other sources" [Report I 1924:57,91]. In 1928, because Indian ministers controlled only certain departments not the Bombay government as a whole, they could not, therefore, prevent the government from declaring that it did not intend to change the existing abkari policy. The rationing policy was subsequently relaxed [Hardiman 1985:220].

Despite the fluctuations in consumption resulting from the anti-liquor agitations, by and large, the peasants and the adivasis in Thana district continued to drink. Much of the liquor consumed was illicit. The duty on still head as well as the tree tax had been raised steadily over the years [RAED 1918:3, RAED 919.3] making it difficult for the poor peasants to purchase licit liquor. In 1922-23 the W C Shepherd, then commissioner of excise, admitted that excise crime was everywhere on the increase. Illicit trade in liquor not only seriously affected the revenue, but nullified government's effort at promoting temperance. The only remedy, in his view, was to "reduce the cost and raise the strength of licit liquor" [Report I:155, 124]. Not only did liquor cost more, its quality too, people complained, had deteriorated. Often liquor of the highest strength was watered down with impure water, making it unfit for consumption. The customers were often cheated on the short measure.

The figures on consumption of liquor showed a drop to 7 drams by 1928-29 and further to 3.8 drams in 1930-31, partially as a result of anti-drink activity, especially the campaign launched by the Congress in 1930-31 [RAED 1930:20; RAED 1932:21]. That these figures did not represent the real situation is suggested by the fact that the excise officials continued to report on the existence of large-scale illicit distillation. It was generally agreed by them that the high price of liquor was driving the people to illicit liquor which was more potent and cost practically nothing, and that illicit distillation could not be suppressed unless the price was brought under control [RAED 1930: 18-20, RAED 1932:18].

The revenue from country spirit rose to Rs 17,37,127 in 1913-14, from Rs 13,92,445, the average of previous five years [RAED 1914:40-41]. The offences related to liquor for the years 1928-29 and 1930-31 were 713 and 669, respectively. That the poor were subjected to harassment was admitted by J P Brander, the commissioner of excise during 1930-31, who considered it the unfortunate duty of the excise officers to "hunt down the illicit distillers." He observed, "The results are prosecutions, fines and imprisonment of poor villagers and members of aboriginal tribe, and often serious affrays between them and the excise staff, sometimes with fatal results. But these people will have liquor, and if they do not get facilities for obtaining licit liquor not too dear they will go in for illicit liquor, the facilities for making or importing which are in most districts plentiful" [RAED 1932:18].

Although after 1937, when the Congress ministry came to power, some attempts were made at prohibition, it was only after 1946 that the Congress government launched and pursued a programme for total prohibition over a period of four years, commencing from April 1, 1947. The plan was to enforce a 25 per cent progressive cut in the supplies of country liquor and in the number of toddy trees licensed to be cut, a reduction in the number of shops, an increase in the rate of excise duty on liquors and enhancement of punishment for excise offences. This programme was duly carried out from April 1950, complete prohibition was launched in the whole of the then Bombay state. When the Bombay Prohibition Scheme completed one year 1947-48, its working showed, on the one hand, a decline in the consumption of liquor to 2.9 drams per head, and on the other, an increase in the offences relating to liquor to 2,177. A greater effort in dealing with the increase in illicit distillation was called for. A total number of 242 persons were recorded to have been convicted for 'drunkenness' [AARED 1950:22,38-39]. In the year 1949-50, the total number of offences recorded were 4,564 which increased to 11,948 in 1953-54. In 1949-50, 1,579 cases convicted for 'drunkenness' were recorded, which increased to 4,678 in 1953-54 [ARAPED 1951:45, 1955:45].

The results of a study conducted in 1950 to record the effects of prohibition in three districts, which included Thana, noted that large-scale smuggling of liquor from the contiguous Portuguese territories as well as the Indian states was carried on in spite of the police vigilance. Further, since illicit toddy could be obtained in limited quantities, the practice by the sellers was to adulterate it with a mixture of water, half-ground cereal, opium, spice, gur (jaggery) and aritha (a nut used as soap) foam. This mixture looked like highly fermented toddy [Report 1953:29]. The process of distillation of liquor from molasses, mahua flowers, half-ground cereals, wheat stalks, etc, was found to be more widespread. The distillation, it was observed, was very crudely done and under insanitary conditions and was, therefore, 'doubly harmful to health'. It concluded, "we came across a few cases of wretched health as a result of regular consumption of such manufactured liquor. If allowed to go unchecked illicit distillation may undo the benefits of prohibition" [University of Bombay 1953.30].

Drinking in Adivasi Culture

Except for some brief periods of abstention from liquor, as we have seen, the lower classes continued to drink in defiance of the colonial regulations. Although the British administrators' accounts appear exaggerated and derogatory it is beyond doubt that the poor, especially the adivasis drank a fair amount and enjoyed it. Liquor was an essential part of their collective existence, both material and symbolic. It is probably for this reason that they could not and cannot be forced to give up liquor.

Toddy served as a supplement to food, and in years of scarcity, a substitute for food [RD 6A 1883,3-4]. The adivasis believed that the spirits had a medicinal influence in counteracting the effects of cold and damp

[Report I 1924:158]. Toddy was found to be particularly effective against malaria and high fever. Officials often admitted that liquor acted as a stimulant as well as a relaxant. Given the strenuous nature of agricultural work and the wet and damp climate of the region, liquor was found to be a necessity. It provided relief after the day's hard labour.

Liquor also served to strengthen community ties. No important event, marriage, death, birth, divorce, an agreement for a contract, could be solemnised without liquor being served to those participating in the event. Among one of the adivasi groups, the engagement of the young boy and girl was finalised by the former's father dropping a little toddy into the cup of the girl's father and vice versa and both drinking together. Liquor formed part of the 'dej' or the bride price which consisted of grains, clothes, beans, etc, paid by the bridegroom's side to the bride's father [Save 1945:83-85]. Drinking and merry-making was a characteristic feature of a wedding [*Gazetteer Thana*, 182, 162]. In fact, the very last ceremony after a wedding was over consisted of the bride and the groom being served toddy from a small hole made in an earthenware pot. By 1945, given the high price of liquor which most adivasis could not afford, it was reported that methylated spirit mixed with water and sugar was used as a substitute for toddy on occasions when large quantities of liquor were required [Save 1945:231].

Toddy was also an important part of the rituals connected with death. Among some adivasis it was customary to serve toddy to the mourners when they returned from the cremation ground. On the fourth day, the mourners would collect the ashes and sprinkle toddy over them [Enthoven 1922:452]. It was also ensured that toddy was made available to the spirit of the dead. The chief mourner would make a cup out of rice flour and fill it with toddy. The cup was placed inside the house with the belief that if at all the spirit returned to the house at night, it could eat the flour and drink the toddy. Liquor would also be served along with food to the group which collected on the occasion of death anniversary. The singers who sang death songs throughout the night would be served with toddy at intervals [Save 1945:130]. Similarly, toddy would be served to those who assembled to celebrate the birth of a child. A few drops of it would be put in the child's mouth for luck. On the occasion of a divorce, the assembly of influential elders who generally granted the divorce would be offered toddy, bought out of the money given by the woman's lover to her husband. Such practices can be found among adivasi groups in other parts of the country too [Fuchs 1960:73-74, 262-264].

Toddy was and continues to be used as a form of payment to the 'bhagat', the priest-cum-medicine man, for his services. Students training to become bhagats paid the fees of a chicken and toddy to their teacher. Unlike the brahmins and the other castes, the adivasis celebrate their religious festivals with collective drinking and dancing. Observations from the field reveal that on important religious festivals, the adivasis make a symbolic offering of liquor to the gods by sprinkling it on the ground for they believe that the family gods 'must have it'. The argument being that "people like liquor and the happiness of the gods depends on the happiness of the people" [Dalmia 1988:60]. An important feature of the celebration of festivals like Diwali, Holi and others for the adivasis is drinking and dancing for several days and nights.

The significance of drinking among the indigenous communities although not adequately explored has been a field of study of anthropologists.[7] The symbolic significance of eating and drinking has been well established [Levi Strauss 1978]. Ivan Karp (1987:86), speaking of a community living across the Kenya-Uganda border, suggests "for the Heso, no matter what area of their life is being examined – economic, ritual or kinship – beer drinking will be found to be a part of it". What Karp says for the Heso may be said of the adivasis of Thana. Beer drinking, he observes, is "the appropriate vehicle for expressing the customary sentiments", it is a symbolic form "through which the living and the dead communicate and co-operate", it is "a symbol of ritual", it is associated with 'hospitality', it is the "basis of sociability and reciprocity", it is related to both "production and economic exchanges" and over all, it is "a symbol of diffuse solidarity and unencumbered sociability which expresses the ideal form of relations among men that Heso would like to achieve" [Karp 1987:84]. In this study of the Cambas of eastern Bolivia, Heath (1962) points out that drinking takes place only within a social context, solitary drinking being inconceivable to the Camba, and there being no guilt associated with drinking, drunkenness or drunken behaviour.

Verrier Elwin, writing about the Baigas of central India, observes the social-ritual significance of drinking among them. It is believed that god himself sent a great giant to find mahua liquor before the creation of the world, thus making it a necessary ingredient in all Baiga worship.[8] Mahua liquor is drunk to drive away disease from the village and at the sacrifices which protects the 'bewar' (shifting) cultivation. Mourners take it at a funeral and revellers at a wedding. It is an essential item at an engagement, it is levied as a part of the fine to be paid as penalty after excommunication. It is drunk for pleasure. It is a libation to the earth mother. Typically before drinking, each person pours a few drops on the ground, chant mantra and salutes the others, and then swallow the liquor in one gulp [Elwin 1939:44-45].

Concluding Remarks

A large amount of illicit liquor continues to be manufactured and consumed in the district at present. In recent years, black jaggery is used as a base for production of alcohol. A large number of shops openly sell black jaggery, ostensibly for cattle feed, although it is well known that it is used for illicit distillation. In some shops, a harmful chemical, ammonia chloride is given free along with the jaggery in order to aid fermentation. A number of adivasis are engaged in illicit distillation of liquor. In fact, a large number of women, generally destitute women without a regular source of income, sporadically manufacture and sell liquor to earn a little extra money. A few of the adivasi households who have date palms on their own lands do a little business by selling fermented toddy to the villagers. Some take toddy trees on lease from other adivasis or the landlords at the rate of Rs 20 or Rs 30 for an ordinary tree.

A number of non-party political organisations working in the region recognise that the adivasi propensity to drink was and continues to be used as a tool for their exploitation, resulting in the alienation of their lands as well as bondage. Liquor is one of the causes of indebtedness of the adivasis to the landlord. Petty lower level government officials often demand liquor and chicken from the poor in return for small favours. Money borrowed for food and liquor to be served at weddings often results in the bondage of the newly wedded. One estimate suggests that about 1/5 to 2/5 of their weekly expenditure is spent on drinks [Saldanha 1984:580]. Apart from being a drain on the meagre earnings, drinking is reported to give rise to quarrels and souring of relations among the villagers. Women have not only to make do with reduced family income but also to bear the brunt of the men's aggression and violence resulting from drinking.

It is for these reasons, rather than to impose a superior morality, that the organisations have encouraged the adivasis to adopt 'voluntary prohibition'. In 1975 one of the organisations, Bhoomi Sena, started a campaign among the adivasis for a reduction of expenditure on liquor, food, etc, on weddings to avoid the incurring of debt (which results in bondage) from the landlord. Although not entirely successful, it certainly had some impact [Munshi Saldanha 1983:202]. Recently another organisation,

Kashtakari Sanghatna, launched a struggle demanding a ban on the sale of black jaggery. Women are reported to have supported the movement. The ban, however, lasted for a short time because a large number of interests involved, shopkeepers, traders, men and women who make illicit liquor, opposed the ban. The activists often find it an extremely difficult issue to deal with, not only because of the big interests involved, but because of the dependence of the adivasis, especially men, on the injurious brew. The anti-liquor movement, largely led by women, which is growing in several states of the country, clearly brings out the fact that the women have to struggle at various levels: the liquor contractors who are directly involved, the bureaucrats and the politicians who protect them, and their own men who are addicted to liquor [Reddy and Patnaik 1993:1059-1066].

In Thana, the adivasis themselves observe that, ". .Long ago people used to drink, but there was a proper way in which people drank. People drank less. Children did not drink at all. They did not know what toddy or liquor was. They would be given bread to eat. It was a very difficult life then. Even when a boy was of a marriageable age he did not drink. Children never drank. Now women also get drunk like men. Children are given drink and they become habituated to it. This seems to be on the increase. In our time there were a lot of mahua trees on our lands. People used to make liquor from mahua. But now mahua trees have been cut. That is why people make liquor out of black jaggery... People buy liquor in the village and make liquor out of jaggery. People drink liquor like water. Earlier we drank on the quiet. If a drunkard was found, he was arrested. Now drunkenness seems to be increasing. Drinking will not stop unless government stops the sale of black jaggery."

Whether drinking has in fact increased in the last decades is difficult to tell. What is, however, clear is that there has been some change in the type of liquor consumed by the people, from fermented and distilled toddy and mahua liquor to liquor made from black jaggery, marked by a significant deterioration in the quality of liquor. There is a growing awareness among the people, aided very much by the political activists, that liquor is a drain on their meagre resources, an obstacle to united struggle for their rights, cause of domestic quarrels, and an instrument of oppression and exploitation by the landlord, the shopkeeper, and the official. That the outsiders have always exploited their weakness for liquor, turning it to an advantage for themselves while causing ruin to the adivasis, is deeply embedded in their collective consciousness. The following story narrated by an old woman illustrates this cogently.[9]

"A brahmin had a daughter and he wanted to bring home a son-in-law. An adivasi was asked. The adivasi agreed, but he sat at home and did not work. His wife asked him why he did not work. He said he wanted implements to work in the forest. He was given the implements. He cut a sandalwood tree and made a cupboard out of it. In the meanwhile the god of death – 'Jum' – wanted to take away the brahmin. 'Kal' and 'Vel' – Time – were sent to meet the messengers and asked them to go to the forest because the brahmin was there. He then pushed them inside the cupboard and locked them in. Jum came in search of his messengers in the form of a Parsi. He started a liquor shop and began to offer a little liquor to the people. The adivasi took his father-in-law to the Parsi's shop. They began to quarrel. The adivasi blurted out of the fact about Kal and Vel. The Parsi gave them more and more liquor. He challenged the adivasi about the truth of having locked up Kal and Vel. The adivasi took them to the forest and opened the cupboard. The adivasi was pushed into the cupboard and locked in. This is how death came to the adivasis."

The adivasi attitude to liquor, in the changed circumstances, appears to be an ambivalent one. It is perceived, at the same time, as a source of enjoyment, a form of escape from the otherwise dreary existence, an inextricable part of the social and religious existence of the community and also as a weakness, a cause of pauperisation, quarrels, disunity and humiliation. The dominant brahminical values articulated by the landlords, the government officials and the social welfare organisations further reinforce the feeling of guilt and humiliation by attributing the poverty and 'backwardness' of the adivasis to such 'vices' as drinking. The state (colonial and post-colonial), too, shows a certain ambivalence towards the 'drink problem'.[10] On the one hand, state policy reflects a higher class/caste morality which often treats the lower class culture with superior disdain, and seeks to establish a hegemony of its own morality. On the other hand, the fact that liquor constitutes a major source of revenue remains an important consideration in shaping the state policy. In recent years, however, it is becoming increasingly clear that many interests are linked – from the shopkeeper, the contractor, the bureaucrats up to the

OUTSTANDING BOOKS

INDIAN SOCIETY : Signs of Disorder

Edited by : Indrani Mukherjee

Focusses on a wide range of topics, i.e. from caste system to crimes against childrens, economic and political criminalisation, the gathering storm of AIDS and the return of the plague the rot in the educational system that permit Capitation fees etc.

1995 ISBN 81-7169-360-1 Rs 525.

DISPLACED POPULATIONS & SOCIO-CULTURAL CHANGE

P.Sudhakara Reddy

This comprehensive study discusses the processes and problems of displacement, rehabilitation and socio-cultural change occured among the displaced yanadis (Scheduled Tribe) of Srihari Kota Island in Andhra Pradesh, Where the Rocket launching Station was established by Indian space Research Organisation.

politician making liquor a sensitive political issue. It is, however, encouraging that the movement for restriction, even a ban, on the consumption of liquor is growing from within [Narasimha and Patnaik 1993:1059-1066]. But the struggle, precisely because of its multi-dimensional character, will be a difficult one.

Notes

[The study has benefited greatly from the methodological approach and analytical framework adopted in David Hardiman's 'From Custom to Crime. The Politics of Drinking in Colonial Gujarat' in Ranajit Guha (ed), *Subaltern Studies* IV, Oxford University Press, Delhi, 1985.]

1 Mahua is a common name for *Bassia Latifolia*, a large deciduous tree. It flowers during February and April when the tree is nearly leafless. The fruit ripens in June or July. The tree is valued for its flowers and fruits. Flowers are eaten either raw or cooked. In order to collect the flowers the ground beneath the tree is cleared of grass and leaves so that the fallen corollas may be swept up each morning. A single tree is said to give two to four or even eight maunds of flowers. Flowers are sometimes fermented and distilled for spirit, and seeds crushed for oil. The cakes remaining from oil presses are used as manure [Parker 1940:29]. In the text Mhowra, mohwa refer to mahua.

2 Prior to British rule, Peshwas raised revenue by imposing direct taxes. Shops were permitted in the coastal districts where owing to the dampness of the climate during the rainy season, spirits were considered necessary to the life of the cultivator. Though the revenue derived from spirits was never large, yet it showed an increase in the 18th century [Bell 1869:3].

3 In south Gujarat too, the British had been trying to discourage toddy drinking since 1860 and as it was believed that excessive consumption was detrimental to the development of the district, a large number of trees on government land were cut down in 1885-86 [Hardiman 1985:193].

4 The nutritional and medicinal value of toddy has been pointed out by a team of experts. It is said to be a very wholesome and popular beverage with high nutritional value. It contains all the constituents which are good and improve digestion. It can be consumed in reasonable amounts without any harm to the system if manufactured under controlled and hygienic conditions. It is a good tonic and has a laxative effect. It is found to contain vitamins and protein, to improve the quality of blood, and to be especially effective in cases of Lithasis [Tek Chand 1965:182-183].

5 Large quantities of mahua flowers were exported to France [QJPSS 14,4, April 1892:26-27]. In 1913-14 total export valued of mahua seeds was valued at 3,64,000 [Troup 1917:30].

6 J L Jenkins, Salt, Opium and Abkari reported that as a result of the experiment introduced in 1888 and continued in 1889, illicit distillation became rampant, the number of cases of illicit distillation detected during the season rose to 606, as against 373 in 1887-88 and 234 in 1886-87. Thirty-four shops had also to be closed during the year for want of custom owing to the enhancement in the retail prices. In short not only did the new system fail in its object of restricting consumption, but it also resulted in demoralisation arising from illicit practices and in very serious loss of legitimate government revenue.

7 For an interesting discussion see David Mandelbawn, 'Alcohol and Culture', *Current Anthropology*, Vol 6, No 3, June 1965.

8 The Warlis of Thana, too, believe that toddy is god's gift to mankind, although not without a cost. A legend collected recently from the region has it that god Mahadev, and his consort, Gauri, went around on the earth, sowing seeds. On the way Gauri was thirsty so god planted a toddy tree and dug a small well at its foot. He fetched some water out of it and gave it to her to drink. By this time, he was thirsty too, so Gauri planted a date tree and dug a small well at its foot. She took some water from the well and gave it to him to drink. Their thirst was quenched but both became intoxicated and began to behave in a crazy manner. When they came to their senses they realised that because of the juice from the trees even the gods could lose their minds. They then decided that from then on, no one could take water from the foot of these trees, but if someone needed it badly, he would have to climb up and extract it out of the tree. His thirst would be quenched but he would lose his senses. She also decided that the date she had planted would give water only for 15 days of a month [Dalmia 1988:25].

9 We are grateful to Shiraz Balsara, a Kashtakari Sanghatna activist, for giving us the story.

10 In their history of liquor licensing in Britain during 1700-1830, Sidney and Beatrice Webb pointed out that from the first, the legislators dealt with liquor traffic as an enemy of social peace, but the efforts to regulate the traffic were constantly thwarted by its value as a source of revenue and the governmental policy of encouraging the brewing and distilling industries [Webb and Webb 1963].

Education and Mission

School as Agent of Evangelisation

Rudolf C Heredia

This essay treats not only of Christian education within the missionary enterprise, but extends to the socio-political impact beyond as well. The first is discussed within the ecclesiastical context of conversion and evangelisation and is crucial to the understanding of the inspiration and gradual evolution of missionary institutions. The second is framed by a more secular discussion and is important because of the pioneering role the missions had in bringing western education to India and the effect this had on Indian society. The author concludes by arguing for a socio-political analysis of and a contextualised theology of secular action for Christian education if the liberating potential of its ideals and purposes is to be realised.

THE close association between religion and education has been a common phenomenon in all societies, until the predominance of secularisation in modern ones. Indeed, as long as the religious world-view dominated the 'fiduciary system', to use a Parsonian category,[1] education had to be a subordinate agency of socialisation under the umbrella of the religious one. The corresponding affinity between these two sub-systems of society, and even the dependence of the educational one on the religious is not surprising. The earliest teachers in society were first the medicine-men, shamans and bhagats, later these become more formalised with brahmins and bhikkus, monks and maulvis; and eventually they are institutionalised in ashrams and monasteries.

It is only later, as learning becomes more secular that education can break out from under the religious umbrella. Today even religiously affiliated educational institutions are more concerned with the secular than the sacred, and serve communitarian objectives rather than theological purposes. But this is a comparatively recent phenomenon. Little wonder then, that "the school has been the principal agent of evangelism in the modern missionary movement"[2] that began with the colonial expansion of the west, and ended with its decline.

The penetration was gradual and drawn over four centuries, but Asia was better able than Africa or Latin America to absorb its impact without surrendering as completely. The scale of these societies, the complexity of their civilisations, the rigidity of their hierarchy rendered them far more resilient, but not quite unaffected either.[3]

This essay deals not only with Christian education within the missionary enterprise, but extends itself to the socio-political impact beyond as well. The first is discussed within the ecclesial context of conversion and evangelisation, and it is crucial in order to understand the inspiration and gradual evolution of missionary institutions. The second is framed by a more secular discussion, and is important because of the pioneering role the missions had in bringing western education to India and the consequent effect this had on Indian society. It concludes to the need for a socio-political analysis of and a contextualised theology of secular action for Christian education, if the liberating potential of its ideals and purposes is to be realised. The continuing commitment of the church's resources to education is today far less than it once was, in proportion to the overall outlay by the government now though once, Christian education was almost a viable competitor to it. Certainly the influence of Christian institutions is no longer the dominant one in education any more, but neither is it insignificant.

As can be expected, the religious concerns of the missionaries were first articulated within a theological discourse. But education must also be understood within a more secular one. The dominance of the first has too easily led to a neglect of the second, because traditional theological issues are too often insensitive or impertinent to the socio-political concerns of our changing times. And even as old controversies are laid to rest by an ongoing working consensus, new ones arise, and the discourse in which they are located already delimits the kinds of conclusions that can be reached.

Now it was at the religious level that the issues were debated at first and this continued to be the dominant discourse up until the decline of the west's missionary venture at the end of the colonial period, when changing socio-political conditions precipitate a different set of concerns and a correspondingly different theology. The debate among the missionaries, is well recorded, specially among the Protestants, and equally well articulated too. But as we shall see it does not provide an adequate understanding of the decisions and events over time, and certainly not a comprehensive one. Socio-economic exigencies, even though often not explicitly articulated in the debate, do get expressed in political decisions which may well be only tangentially connected with religious or theological issues.

It is our contention here that the neglect of the socio-political context of Christian education has not helped us to understand or orient it to some of the most relevant and noble objectives the church has opted for. But before we can address ourselves to this issue, we will first make a brief historical sketch of mission education in India, in the context of the wider educational system that emerged over this period, to serve as the backdrop for the discussion of the issues to follow.

Historical Sketch

The history of the Christian mission in the east since the 16th century is intimately bound up with the colonial expansion of the west. The gospel came in the ships of the conquistadors whose purpose was to conquer and convert. Inevitably this fusion of the sacred and the secular led to a confusion of the religious and the political, the entanglement of the ecclesial and the economic. Until the very end of the colonial period, Christian education was very much part of the missionary enterprise and could not but be involved in the same controversy and confusion. The tendency was to confound the two distinct discourses and co-opt the secular one into the religious.

There have been three main agencies for the spread of western education in India: the Christian missions, the governmental, and private Indian ones. Obviously different agencies would have differing goals for their educational involvement. The usual way of conceptualising these has been to polarise them within a dualistic framework: "Government versus private, indigenous versus Western and imperialist versus nationalist", etc.[4] But our concern here is more limited. It is mainly with the Christian educational agencies, in the context of the others in order to situate historically the issues to be discussed later.

The Portuguese were the first to bring western education to India establishing schools in their settlements at Goa, Daman, Diu, Cochin and on the Hooghly.[5] Already in 1543, on January 25, the feast of the conversion of St Paul, the Jesuits opened a college named after the saint in Goa. It was

originally began "to promote the training of priests,"[7] but its scope was very soon extended as in most Jesuit institutions of the time, to other students as well. The French too had begun elementary schools at Pondicherry, Mahe, Chandernagore, and Yanam.[8]

There schools were generally in the vernacular, at least at the elementary level, and for religious instruction.[9] However, in 1684, in order to strengthen Portugal's hold on Goa, Konkani was banned by viceregal decree on June 27, and parish priests and school masters were instructed to teach only in the colonial language, so "that in time it may become the common language for all, making thereafter no use of the mother-tongue".[10]

Gradually the local 'path-shales' were replaced by parish schools throughout the colonial territories and "churches replaced temples as centres of learning in the wake of conversion to Christianity. Church schools were maintained at the cost of the village communities which paid the school master for teaching the sons of the gaunkars".[11]

Further north, "the early history of education in Bombay is chiefly a record of Christian Missionary enterprise".[12] The Portuguese "Franciscans were not only the first missionaries, but also the first school masters".[13] In fact, a month after taking over, Bombay island from the Portuguese, Humphrey Cooke wrote to London on March 3 1665: "The general language is Portuguese,so that it will be necessary the statutes and laws be translated into that language."[14] The British eventually changed this. Fearful of the influence of the Portuguese friars, they expelled the Franciscans on May 13, 1720. They were then replaced by Italian Carmelites.

This began the gradual decline of Catholic education in Bombay. By

> 1770 the former parish schools were no longer functioning, illiteracy, which had practically vanished, now reared its head again. . from 1770 to 1850, not a single Carmelite school was started in Bombay.[15]

In 1850 a Protestant account in a local publication described "the Bombay Baptists" thus:

> With two or three exception, the respectable portion of the European community and of this creed appear to be ashamed of it and do not even acknowledge it. *Bombay Miscellany of Western India*, cited by E R Hull, *Bombay Mission History* (2 vols) Vol I, pp 140-41.

This opinion is collaborated from within by a certain Doctor Dallas speaking in St Xavier's College hall in 1876:

> When I arrived in Bombay in the early fifties, I found the condition of the Catholics especially as regards education so miserable, and their social position so low and contemptible, that I felt almost ashamed to profess my religion; compared with Protestant institutions, ours were the merest corner-schools, or rather, there were no institutions worthy of the name school.[16]

It was only in 1869, that the founding of St Xavier's College by the Jesuits marked "the emergence of the Catholic community from obscurity into the public eye".[17]

Beyond Portuguese territory as well, it was the "Roman Catholic missionaries who took the lead in establishing elementary and secondary schools in Madras and Bengal."[18] However, "Catholic Missions did not do effective work during the period from 1720 to 1850."[19] The suppression of the Society of Jesus in the Portuguese colonies about this time and later in the Roman Church as well in 1773, certainly had a disastrous effect on the missions the world over, and in India quite definitely.

However, with the restoration of the Society in 1814, and the return of the Jesuits to India a revival in Catholic education began, especially with regard to higher education.[20] Some of the colleges that marked this turning point in Catholic education in the 19th century were: St Joseph's College, founded at Nagapatnam in 1844 and moved to Tiruchirapalli in 1882, St Xavier's College, Calcutta, 1862, St Xavier's College, Bombay, 1869, St Aloysius College, Mangalore, 1880, St Joseph's College, Darjeeling, 1888.[21] In the post-independence period Catholic colleges have rapidly increased from 30 in 1944 to 38 in 1948 and to 76 in 1967.[22]

Yet there still remains the urgent

> need to do something about the poor level of higher education among the Christian community. For a community that has practically the highest level of literacy in the country, the percentage of University educated Christians is disproportionately low.[23]

Today Catholic education is so much sought after that now

> there is always the temptation to forget one's roots – e g. Christian institutions which began as orphanages, today appear as high class boarding schools, so restrictive in admissions that there is no place for the poor in the inn.[24]

The accusation of elitism, academic or otherwise, may be somewhat of an unfair over-generalisation. But the widespread perception of these institutions having an "almost exclusive concern with the social elite and the intellectual elite,"[25] is not entirely without a basis.

Already from its beginnings in India four kinds of institutions can be distinguished in Catholic education:[26] (1) elementary grammar schools attached to churches and mission stations, (2) orphanages and other like institutions, for Indian children in which besides elementary instructions, agricultural and industrial work was provided, (3) seminaries and religious houses, for theological instruction and training candidates for priesthood, (4) Jesuit, and later other colleges for higher studies.

Basically it is still these four kinds of institutions which account for the largest part of formal Catholic education, and the typology does help us to derive some provisional but pertinent conclusions. The brief historical outline above was meant to be selectively illustrative of this.

Firstly, the Catholic school was not at the cutting edge of direct evangelisation but rather followed in its wake. It was not so much an instrument of missionary expansion as an agency of community consolidation. It was used not so much to preach to and baptise the unconverted, as to instruct and educate the converted.

Secondly, following on this, the medium of instruction at the beginning was in the vernacular, specially for religious and primary education of the neophytes, though the institutional model used for this was western. It was later that the language of the coloniser was imposed, more for political than pedagogic reasons. In competition then with the western model and the coloniser's dominant language, the indigenous education system collapsed and local languages languished.

Thirdly, post-school education was firstly a concern for providing an adequate clergy, but it did not stop there. However, it hardly reached beyond the upper castes and classes of Catholics, and non-Catholics. Hence we find that while literacy levels are comparatively high among Catholics and school education quite widespread, college and university qualifications are proportionately lower than for other equally literate communities.

Protestant Churches

Among the Protestants, "the first missionaries to start regular schools in India for general education were the Danes working in the Madras Presidency".[27] In 1706 Ziegenbalg and Plutschou arrived in Tranquebar and by 1725 there were 17 schools for 'Heathen and Muhammaden' children and four for Christians.[28] The first Protestant English Mission came to Madras with the Society for the Promotion of Christian knowledge in 1727 and stared schools in Madras, Tanjore, Cuddalore, Palamcottah and Trichinopoly. The Baptists came to Bengal in 1793, and the London Missionary Society in 1804; the Church Missionary Society and the Wesleyan Mission had far-flung settlements at Surat, Meerut, Agra, Calcutta and Tranquebar already in the 19th century.[29]

One of the motivations of the Protestant missionary was their concern with "the

oval of apprehended trouble owing to the predominance of Roman Catholics among the inhabitants of the places where they settled."[30] But the mission to the non-Christians gained increasing importance, especially with the decline of Portuguese and French influence in India. For already the first Danish mission schools and very soon the famous trio of Carey, Marshman and Ward, began to use schools as a means of evangelisation, and founded a school in 1818 at Serampore under Danish protection in the face of opposition from the East India Company, which was apprehensive of the effect of this education on the people, "lest it make them less docile".[31]

The beginnings of the Protestant mission to India in the 18th century were indeed small and not effectively supported by the East India Company, when not actively opposed by it. "It is doubtful whether in 1800 more than a thousand children were being educated in mission schools."[32] However, the first half of the 19th century saw a rapid expansion of Protestant missionary endeavour in education, specially after Macaulay's minute of 1835, and when English replaced Persian as the official and court language in 1837, and again after the 1844 resolution of Lord Hardinge prescribed English as a preferred qualification for government service.

The Company Charter of 1813 granted the missionaries a new but restricted liberty, though in the one of 1833 "all restrictions were at last withdrawn".[33] Some of the Company's servants, like Martin Richard Gubbins of the Bengal Civil Service would even say that "the missionary is the true regenerator of India".[34]

But after Wood's Despatch of 1854, which encouraged government withdrawal from education in favour of other Indian agencies, and particularly after the 'mutiny' of 1857 the second half of the 19th century saw a change of emphasis from expansion to consolidation and quality in Christian education. This was specially after the Education Commission of 1882.[35] Thus some of the most prestigious institutions in higher education are still Protestant ones: Madras Christian College, 1839, St John's, Agra, 1850, St Stephen, Delhi, 1881, as also the Christian Medical Colleges at Ludhiana, 1894, and at Vellore, 1918. By 1931, the Lindsay Commission[36] found that Christian institutions had been displaced from the premier position in education in India by the expansion of governmental and other private resources committed to it. But

> For the most part of the 19th century, they dominated the Indian educational scene, not merely in regard to the magnitude of their educational enterprise but also in regard to the ideas and values inculcated through

BOOKS THAT MATTER

THE WOMAN IN INDIA : Myth and Reality
J.P. SINGH (Ed.)

Eminent scholars and serious thinkers on the gender issue, feminism and women's emancipation probe into woman as different from man in a highly readable account of the myth and reality shrouding womanhood today.

1995 404pp 23cm Rs. 600 81-212-0505-0

WOMAN IN HINDU LITERATURE
R.P. SHARMA

From divine to erotic, the woman in the Hindu literature has been portrayed in many-coloured hues. This study is the quintessence of all that has been written about her since the beginning of civilisation till today.

1995 312pp 23cm Rs. 460 81-212-0501-8

Concept

MODERN HISTORY OF JAMMU AND KASHMIR
J.C. Aggarwal and S.P. Agrawal

849pp. (556-6) set Hardbound Rs 1500 per set of 2 vols.

The volumes brings together all important documents about the Kashmir problem in one place. It also provides the correspondence between Government of India and UN bodies and Government of Pakistan, speeches in the Security Council and resolutions adopted in UN bodies. It also contains documents and papers relating to 1965 conflict and Taskhent Summit, etc.

J.C. Aggarwal is former Deputy Director of Education/Executive Director of Delhi Bureau of Textbooks, Delhi Administration.

S.P. Agrawal is former Director, National Social Science Documentation Centre, ICSSR and Member Secretary, Indian Association of Social Science Institutions.

> education. Even more importantly, from the 1870s the Protestant missions were seriously trying to influence the intellectual, religious and political awakenings of the educated Indian on the assumption that winning over the intelligentsia was the surest method to bring about the eventual conversion of India, as a whole.[37]

Once again the short historical sketch outlined here suggests some pertinent though tentative conclusions, which are mooted to carry the discussion further.

Firstly, in comparison to the Catholics, Protestant mission education was more clearly and decidedly evangelical in purpose. This is evident by the number of far-flung schools and college in their mission territory, even where there was no sizeable Christian community to cater to as yet. The first to urge this evangelical purpose for Christian education was Alexander Duff, (1806-1876) the founder of the Scottish Church College in Calcutta, who landed in India in 1830. He thought "that he was laying a mine which would eventually explode and blow Hinduism to pieces."[38] William Miller (1838-1923) of the Free Church Mission Society of Scotland, refined this somewhat crude approach and changed the purpose from direct evangelisation to that of a "preparatio evangelica", where education would be the Christian leaven for Hinduism in order to bring "Christ to India" [39]

Secondly, with regard to language the closer connection between the Protestant churches and the British government made the transition from the vernacular schools, of the early days of the Danish mission, to the English medium ones of missionaries, like Duff, quicker and more decisive. For English was seen not only as a positive gain for employment opportunities by the Indians, but also as a subtle through effective means of transmitting gospel and western values by the missionaries.

Thirdly, moreover, with the change of emphasis from quantity and spread, to quality and excellence, the allocation of resources for higher education and prestigious institutions followed quite inevitably. And even today many Protestant colleges have still held their ground here.

Besides the missionaries there were other agencies that formed the wider context of education in the country. From the beginning of the 19th century the government played an increasingly important role in education, while in the second half of the century other private Indian agencies entered into the field. Obviously each of these had their own interests and goals. Here we will be more concerned with the governmental ones, since these impinged more directly and critically on the missionary endeavour.

Colonial Government

The India Act of "1813 was the first important landmark in the East India Company's education policy,"[40] for it included "a clause requiring the annual expenditure by the Directors of the East India Company of a lakh of rupees on education".[41] Earlier the Company had refrained from such commitments, but now the earlier ban on private enterprise in education in its territories was lifted in 1815.[42] In 1833 the Company's allotment to education was increased to ten lakh rupees.[43] But the government's commitment was never adequate to the task.

For it adopted a 'downward filtration' approach as first proposed by Lord Auckland in 1839, and described by Nurullah and Naik thus:

> the Company was expected to give a good education (which then necessarily meant education through English) to only a few persons (these may or may not be from the upper classes) and leave it to these persons to educate the masses (through modern Indian languages) [44]

The implicit class and caste bias of such an elitist policy was inevitable. It was only strengthened further by the adoption of Macaulay's minute of 1835 in favour of English as the medium for European learning. This effectively destroyed the old indigenous system of education and put the new western one decisively beyond the reach of the masses.

The Company's education dispatch of July 19, 1854, called the Wood Dispatch, rejected this theory in principle, but

> replaced it with the doctrine of state withdrawal in favour of a system of grants-in-aid to privately managed institutions. The expansion of education became dependent on the private agencies who were willing to carry the burden which the government pleaded inability to bear.[45]

Subsequent to the grants-in-aid code, "about a third of the cost of education was borne by the private agencies, two-thirds by the government."[46] This relieved the government of some of the financial cost and much of the organisational initiative in education, but it led to "the *laissez-faire* policy, enunciated by the Indian Education Commission (1882)",[47] also called the Hunter Commission.

The rapid expansion of education that resulted from this caused serious concern to the government. Curzon tried to put some order and consolidate education with an emphasis on quality over quantity, but in spite of the Indian Universities Act of 1904, the Calcutta Universities Commission, chaired by Sir Michael Sadler in 1917 still found the system "fundamentally defective in almost every aspect."[48] The demand for education, especially western and English education, fuelled a rapid expansion by private agencies motivated by the desire of upward mobility for their respective caste and/or religious communities. Thus in 1967 J P Naik estimates that "85 per cent of our colleges and 65 per cent of our secondary schools are in the private sector".[49]

Following the missionaries, as each new group jumped on the educational bandwagon, the brahmins after 1882, the non-brahmins after 1921, the dalits with Ambedkar in the 1940s, and the adivasi seva mandals in the 1950s, government recognition and grants were demanded not on the basis of performance and quality, but on the principle of equality and non-discrimination.[50] Later with education coming under the provincial and state governments, the politicisation and commercialisation of education certainly has not helped more worthy pedagogic or democratic purposes, but it has rather co-opted education to communal and consumerist ones.[51]

A unique feature of the official education policy in British India was its strict religious neutrality. This was according to some "absolutely without precedent or parallel elsewhere, besides being entirely opposite to the traditional idea of education in the East", or for that matter in Europe at the time as well.[52] The 'Pius Clause' for which Charles grant agitated in England, was rejected by the Company's charter of 1793, and though the charter of 1813 and 1833 gave the missions greater freedom, the government retained its religious neutrality.

Thus in his farewell address to some missionaries Lord Bentinck in 1835 reaffirmed that "the fundamental principle of British rule, the compact to which the government stands solemnly pledged, is strict neutrality... with the religious beliefs of the students."[53] The dispatch 1854 forbade any religious instruction in government schools, and the Education Commission of 1882 reinforced this. Queen Victoria's famous proclamation of 1858 solemnly prohibited "all interference with religious belief or worship of any of our subjects, on pain of our highest displeasure."[54]

We are not arguing here that this religious neutrality was a question of moral conviction on the part of the government. Even people like Sir Charles Trevelyan, prominent in the educational controversies of the 1830s and Mounstuart Elphinstone, in Bombay, in spite of their secular credentials were more than just sympathetic to the missionary agenda in education. However, we would not agree that this religious neutrality was simply a matter of historical accident.[55] Given the diversity and depth of religious affiliations in India, this was an obviously pragmatic political necessity. Indeed

> This was unquestionably one aspect of British policy in India. All reasonable men took it for granted that the government should interfere as little as possible with the manners, customs and ideas of subjects whose loyalty was not, and never could be more than precarious."[56]

Here again with regard to the wider contact of education in India we conclude with some tentative observations for further consideration. Firstly, in spite of much liberal inspiration and many noble ideals, government educational policy failed in effective executive follow-up. It is interesting to note that although the Company officially accepted responsibility for public education in 1813, the government in England did so only in 1833.[57] But the difference in their delivery was one of the political will and vested interests involved. Other private Indian agencies in education were overly constrained by more narrow communal preoccupations, and though the nationalist movement was the inspiration for some, it was never quite strong enough, in spite of Gandhi's challenge, to break free from the system they inherited and operated within.

Even the religious neutrality of the formal system was less a committed secularism than a political expediency and this tended to follow whichever way the political winds would later blow. For the grants-in-aid code readily allowed the public good in education to be co-opted by private interests in the community.

Secondly, the new western institutional model and the English language medium through which it was implemented, dismantled the old indigenous system of education and set back vernacular literacy. The overall literacy statistics tell the tragic story convincingly. Using literacy percentages as a vital indicator, we have the following figures for British India: 1881 –4.8 per cent; 1891 –5.6 per cent; 1901 –5.3 per cent; 1911 –5.9 per cent, 1921 –7.2 per cent; 1931 –9.5 per cent; 1941 –16.1 per cent.[58]

Thirdly, not only was the expansion of the new education system unable to make up for the demise of the old one, it was itself inadequate to meet the needs of an industrial and an egalitarian society. The emphasis was on liberal not technical education, which existed more in intent than in effect. For as Lord Curzon himself admitted: "the plant of technical education in India, subsisted mainly on platitudes in vice-regal and gubernatorial speeches."[59] In sum, "the low rate of literacy, neglect of mass education, as well as of technical and vocational education, and the methods of teaching, were all handicaps in the path of development."[60]

Moreover, higher education was extremely elitist, a small tip of a pyramid with a very inadequate base. The focus here was on the transmission of knowledge, not its creation,

Authors are requested to submit their papers by 30th of November 1995 preferably on floppy disk[s]

and that too more in the arts than the sciences, more generalists than specialist, more liberal than professional.

And so like much else in the country at the time, Indian education continued to be a colonial appendage to the British system. In spite of, and partly because of the contribution of the missionaries and the role of other various agencies involved, Catholic or Protestant, governmental or private, nationalist or communal, it remained "a colony, intellectually, culturally and even spiritually subordinate to the west and England".[61]

Discussion and Analysis

What was the contribution of the missions to this system of education in India? Certainly they were pioneers when there were few other agencies to shoulder the responsibility for education. The indigenous system lacked influential patrons and the Company held itself aloof from much ventures. Few would doubt that "the origin of the present system of English education in India is to be sought in the activities of early Christian missionaries".[62] But not just the beginnings, they were largely responsible for implementing and stabilising the western institutional model of education with English as the medium of instruction. They were in fact so successful that the demand for admission into Christian educational institutions by upper class/caste non-Christians was much greater than what could be made available.

Indeed,

> For well over a century Christian educationists had stood at the top of the educational hierarchy, not only as pioneers but as leaders in that they excelled in the two principal functions of formal education – the imparting of knowledge and inculcation of values. Moreover, Christian educational institutions were among the best organised and best managed in the country... All in all, Christian education stood on a pedestal during the British regime.[63]

However, mission education was very much part of the larger missionary venture, and always functioned within the ambit of the Christian enterprise. This connection may have been more or less explicit at times, but it has never quite been severed. For even when the content of its educational service was modern and secular, its inspiration still remained Christian and religious.

No wonder then that the perception of the educational needs of this country were filtered through their concern for their church, and the inevitable mismatch between an alien institutional system and indigenous pedagogic requirements could not be addressed. This of course was unavoidable as long as the school was used as an agent of evangelisation. For if mission education was to be implemented and contained within the traditional structures of the church, it could hardly be expected to be non-sectarian in breaking new ground in a secular field, even one with as close an affinity to it as education.

The main contribution of Christian educators then was largely within the parameters of the colonial systems, and it served the Christian community within the churches rather well, even though its role as an agent of direct evangelisation for those outside it was increasingly challenged and marginalised. However, Christian educators, by and large, did not seriously question the basic features of the system for this fell outside the purview of their concerns. Perhaps too late did they recognise that

> the alliance between the Christian colleges and the government and the University system while it has of course given the colleges great opportunities for service, has on the whole been bought at too great a price Christian higher education has seemed to be a cheap form of missionary enterprise.[64]

A fortiori then this would hold true at the lower levels of government-aided education as well.

Christian education, then, was not prepared by its history for a new role in post-independent India. In fact,

> the course of Christian education since independence does not impress the critical observer as a bold and spontaneous effort on the part of a mature section of Indian educators to lead the way in the crisis brought on by the changing times. It does not seem as if Christian educators have truly taken up the challenge of educational reconstruction for an Independent India.[65]

Even as late at 1967, a perceptive and sympathetic educationist like J P Naik does not consider directly challenging Christian educators to the mainstream task of national development. Instead he proposes three purposes for Christian education in post-independent India: the reconciliation of religion and science, the provision of English teachers (!), and a Hindu-Christian encounter.[66]

What could be the underlying reasons for the missed opportunities of Christian education in our country? We believe that these reasons must be sought in the debate within the churches regarding the role of mission education, to which we now turn.

The discussion that preoccupied the missionaries with regard to the school as an agent of evangelism involved a debate about two approaches to evangelisation in India: (i) evangelisation of India through education and intelligentsia; and (ii) evangelisation of India through the masses.[67]

It was a debate that began already in the 19th century and which the Protestants articulated better than the Catholics, who seemed less accustomed to discuss such issues publicly, at least from the source material available to this writer. But the importance of the issue to the goals and purposes of the Christian educational mission cannot be gainsaid. For as Bishop Newbigin insightfully observes:

> The problem of stating our goals as Christian colleges is part of the wider problem of stating in clear terms the theological justification for the pursuit of secular goals.[68]

From the earliest missionaries the goals of Christian education were threefold:

> first, education of Christians themselves in a Christian atmosphere so that they could be good members of their church and occupy important positions in secular society; secondly, to render service to Indian youth at large; thirdly, to build evangelical bridges towards the country's intelligentsia and thus pave the way for an acceptance of the faith.[69]

In other words these were communitarian, service and evangelical, objectives, respectively. While the Catholics may have stressed the first and the Protestants the last, all three goals were present in varying degrees at different times in mission education. Much seemed to depend on what priorities the religious debate justified at the time.

In the first half of the 19th century, Alexander Duff aggressively urged the use of English education to undermine Hinduism and thereby foster conversions. But it soon became apparent that Hindus stopped half way, accepting western education but not Christian beliefs. By the time of the Allahabad Missionary Conference in 1872, "a fresh apologia for Christian education and the educational missions became inevitable."[70]

This was provided by William Miller who argued for a preparatio evangelica, "to prepare the minds to be receptive to Christian principles",[71] and not merely adding numbers to the church. Hence there was now a change of "purpose and role from conversion to evangelic preparation through the diffusion of Christian principles".[72]

Thus began the 'missions to the educated'. This led to

> multifarious religious tendencies, ranging from loss of faith, atheism, agnosticism, indifference, positivism, free-thought, neo-orthodoxy, revivalism, including its extreme aggressive forms of anti-Christian, anti-missionary undertones.[73]

Moreover, the very Christian principles the missionaries proposed of equality and brotherhood, etc, were used by the nationalists to oppose the colonial government much to the dismay of their teachers.

However, it was persons like T E Slater, who were sympathetic to this awakening of India, both religious and nationalist, describing it "as the Renaissance period in the history of the Hindus".[74] Slater's changed approach presented Christianity not antagonistically but as the fulfilment of all the higher and nobler truths of other religions.[75]

The Jesuit, Fr P Johanns, in Calcutta was very much within this perspective with his

To Christ through the Vedanta, in the Light of the East Series, as also Stanley Jones's *Christ of the Indian Road*. More pragmatically, the objectives of Catholic schools and colleges have been

> all more or less justified by their response to the needs of a particular time and place. They include: a Catholic education for Catholic children; the raising of the social and economic level of the Catholic poor; the socio-economic uplift of tribals and harijans; functional literacy and job-skills for the less literate; the establishment of centres for Catholic acceptability in major urban areas; the provision for the nation of highly literate and skilled leaders in professional life; inculcation of habits of moral integrity in a generation of leaders, natural elites ..[76]

But the desire to evangelise this national awakening, put the missionaries in the dilemma of sympathising with a movement which opposed a government on whom they relied for support. Slater, who represented the moderates, summed up three main objectives justifying his support for the Congress Party: in terms of the fusion of the peoples of India into one nation, regenerated morally and politically, and consolidated in a just, and healthy union with Britain.[77]

What we find here and also later at the end of the missionary venture in the colonial period is a still persistent paternalism. For the foreign missionaries were quite conscious of maintaining their identity as representatives of the ruling race.[78] As a cynical remark from some local Christians would put it: "the missionaries wanted them to become only their brothers but not their brother-in-law."[79]

Obviously such a mind-set was quite inadequate to ride out the political storms that were brewing on the national horizons. For few missionaries would risk the political involvement of a C F Andrews or the cultural commitment of a Verrier Elwin. No doubt an appropriate theological justification was conveniently at hand! However, these remained an embarrassing aspect of the missionary mentality, the affinity between the Christian missions and colonial rule, which cannot be easily gainsaid. For

> the principle of ecclesiastical establishment, for all that it was not formally recognised, yet played a quite important role in the expansion of the British empire and the Christian faith. Many problems facing the Christian Church in Asia and Africa today derive from this fact.[80]

All through these debates there are changing theological understanding underlying the issues being discussed. Beginning with an aggressive, almost imperialistic stance for religious conversion, it was modified into a more moderate view of diffusing Christian values and as a preparation for a full acceptance of Christian beliefs. The theology of fulfilment changed the emphasis from bringing 'India to Christ' to bringing 'Christ to India'. But at the end of the missionary venture, it is still a long way off from the religious dialogue and pluralism so much needed today.

The outcome of these exchanges would be relevant mostly to those within the religious discourse in which it takes place. To those on the outside, it would seem more like a hot-house argument among an in-group. For all its very real impact on Indian Society, "education did not help Christianity the way Trevelyan and Elphinstone, among others, had hoped".[81] They were mistaken in thinking that the liberal inspiration of Christian education would do in India, what the church seemed to have done for the poor in England.[82]

For a more satisfactory explanation of the actual dynamics involved, we must enter into a socio-political discourse that provides more pertinent perspective.

As we have remarked earlier Indians sought Christian education because it opened up preferred economic opportunities for them and not out of any religious preference. In fact they were rather suspicious of the missionary connection of these institutions. This was pertinent enough to put a serious question to the assumptions underlying the very basis of these institutions, and thus it led to a "reversal of priorities" in favour of a more direct evangelisation of the masses especially after 1910,[83] and later to the more secular approach of the social gospel.[84]

However, with the political awakening of India and the freedom movement, there "was a growing awareness among British officials of the political dangers of English education".[85] This was a threat that put the government in an obvious dilemma with regard to education, specially at the higher level of the university. And yet, as Krishna Kumar insightfully argues, if "the concept of citizenship underlying the vision of the educated man in colonial India is examined in its ideological roots,"[86] a fundamental "homonymy between the colonial and the nationalist views of the role of education"[87] is apparent.

For as the East India Company evolved into a colonial state, commercial exigencies had to be replaced by political socialisation with regard to its subjects. Towards this end, colonial education was to be more than an assembly line producing clerks; it was to train the student in moral uprightness before the law and to be a loyal subject of the colonial order. "The emphasis it placed on the formation of dependable habits concerning the use of time and space was directly related to the demands of factory life."[88]

Moreover, the very elitism of the system especially in higher education, could not but make the educated Indian feel as patronisingly towards the illiterate masses, as the colonial sahibs felt towards him. The argument between bureaucracy and the Indian intelligentsia was in fact over the claim to speak for the Indian masses. Would it be a Curzon or a Gokhale![89] But at another level the "identification between the educated Indian and the colonial state consolidated the boundary walls around school knowledge"[90] and left the masses of India out.

Thus, in spite of the high-minded rhetoric, what the nationalists did really achieve was less a change of political structure than a 'circulation of elites', political swatantrata, not Gandhian Swaraj. For the people, however, this only meant that the white sahibs were changed for darker ones. Indeed,

> It is worth asking which of the two roles of education was more influential in shaping the cultural and political life of India at the turn of the century – the role of strengthening group solidarity among the educated, or the role of disturbing traditional hierarchies. The first is rarely acknowledged, whereas the second has been highly over estimated.[91]

For an elitist system is best able to do the first, but only a mass-based one can achieve the second. This has not as yet happened in our country, certainly not with secondary, or even primary education.

On the contrary, the pattern of development has only accentuated the elitism and paternalism, the injustice and domination in the Indian state. In all this "the education system in independent India remained an agency contributing primarily to the maintenance of law and order."[92]

The nationalist promise of equality of opportunities for all Indians expressed itself in education as an irresistible demand for the expansion of the system, which was fuelled by the class/caste bias of vested interests, "who exploited the code for missionary purposes, profit, communal advantage or political gain".[93] The social commitment to equitable access for weaker sections through reserved admissions for them is still being resisted on the grounds of 'merit', which is still defined by an examination system that in any case favours those, who already have a privileged access to the means to excel in it, with even further access and privileges. So "what really began as the dream of social transformation became a demand for avenues of upward mobility of individuals".[94]

The anti-brahmin, and other backward caste movements in western and southern India did mobilise and broaden the educational base in society somewhat, and this augured well for the break down of traditional hierarchies. But soon enough the 'transformational force' of these movements "was subtly neutralised by utilitarianism and channelised towards the task of creating a market society".[95] Eventually, these too settled down to secure their own communal advantage, with the consumerist allure of the market-place, leaving the other under-privileged and disadvantaged groups behind.

The radical alternative urged by Gandhi's 'basic education', which wanted to validate local skills and knowledge to make education

self-sustaining, and to integrate it with the lives of the masses, was never given more than lip-service and such a half-hearted implementation, that it was almost deliberately predestined to fail.

No wonder then the social equality and the economic development which education was to deliver for all, became increasingly problematic and is now in crisis. Hence,

> the first conclusion we may draw from this review and social analysis of the educational developments over the last thirty years of independence is that the old pre-independence systems and structure of education have, by and large, been maintained and continued... The second conclusion that emerged is that while the system carries on in its obsolete fashion, a considerable expansion – a wider spread of education – has taken place.[96]

Now given this fundamental continuity between pre- and the post-independence education, and the close identification of mission education with the system from its very beginnings, it was hardly likely that Christian education later would break free from it, given the advantages it had derived from this connection and still hoped to. Notwithstanding the soul-searching of Lindsay and his report[97] the consensus recommendation has been in favour, not of withdrawal, but of a reorientation, which has yet to proof effective.

We believe in this socio-political perspective, that it is, that we must look for the basic dynamics of the role of the school as an agent of evangelisation. For it explains why mission education succeeded less at the Christianisation of those it educated, than their embourgeoisiement

Conclusion

The religious discourse, we had outlined earlier, misses the issues of the larger social situation rather completely. It seeks to explain the impact of, and the response to Christian education in the context of other-worldly concerns and proves quite inadequate to deal with the this-wordly ones on the ground. For the implicit agenda and the real decisions, that influences the role which education plays, must be contextualised in the socio-political realities that obtain, even when they are legitimated in other-worldly religious terms.

What we urgently need then is a socio-political analysis of Christian education, which must be set in a secular discourse. But we also need as urgently a theology of education that breaks out of an exclusive religious discourse, to one which sees the school not only as an agent of evangelisation, but rather, firmly legitimates it in terms of a theology of secular action and involvement. Only when both these are done will Christian education be able to fulfil its task and be truly 'good news' to people, and not just a limited edition of its more catholic ideals.

In his perceptive report in 1931, Lindsay urged a plan for "Christian education as being distinctive but not exclusive."[98] But today, while Christian education is still striving to secure its evangelical purposes, Christian institutions have well-nigh achieved the opposite of Lindsay's recommendation, being rather exclusive without being quite distinctive!

For it seems to us that the neglect of the socio-political issues involved in mission education has allowed Christian efforts to be co-opted by vested interests and integrated into the larger system in spite of its high-minded ideals, articulated by a "noble band of workers to whom India owes the beginning of English Education".[99]

Perhaps what we not need to make effectively, is a distinction between the church-related school, which is constrained to operate within the educational system, and Christian education that must reach out beyond to the very ones awaiting to be conscientised and liberated by it. Our educators cannot be just the apostles, scholars and gentlemen[100] as of of yesterday. They must also be the prophets, activists, and witnesses for today.

DISCUSSION

Protection and Exports

Sugata Marjit
Abhirup Sarkar

IN a recent paper Patibandla (1995) criticises our earlier work [Marjit and Sarkar 1995] on two grounds. First we do not consider the liberalisation of intermediate good imports which are used in exportables. If tariff goes down marginal cost of export production drops and exports expand. Thus a general reduction in tariff may expand exports. Second, there is a 'proposed ambiguity regarding the local firm's choice of the pricing rule under a tariff. Our response is as follows.

We specifically considered the case with final goods and tried to explain what is really meant by saying that our exports are residual. However, even if one brings in intermediates and marginal costs shift down, there is no *guarantee* that total exports will expand because as tariff on final goods comes down, domestic sales expand and as mc comes down total production expands. One does not know about the *surplus*. But the main point is that conventional wisdom regarding 'tariff-decline led growth of exports' would have to be clarified

The second criticism is totally unfounded if the 'profit-maximisation' motivation of the monopolist is closely followed. We did not provide the explicit proof because we thought it was too obvious. But now we provide a schematic demonstration of the optimal pricing rule.

Let tm be the tariff rate such that,

$P_w + tm \geq P_m$ (we define P_m later) (1)

We know that the profit maximising choice of local and global sales are Q_L and Q_w satisfying the following:

$mr(Q_L) = P_w = C'(Q_L + Q_w) = mc$ (2)

With the local selling price at $P_m = f(Q_L)$. f(.) being the demand function.

Total profit is given by

$\pi = f(Q_L)\, Q_L + P_w\, Q_w - C(Q_L + Q_w)$ (3)

Now suppose tm is reduced to t with $P_w + t < f(Q_L)$.

We prove that the local firm *must choose to sell at* $(P_w + t)$ and since there is *no other firm*, it would serve the entire market.

Given P_w, total $Q = \hat{Q}_L + \hat{Q}_w$ does not change.

The new aggregate profit therefore is

$\pi = P\,\hat{Q}_l + P_w\,\hat{Q}_w - C(\hat{Q}_l + \hat{Q}_w)$ (4)

Note that $\hat{Q}_l + Q_w = \hat{Q}_L + Q_w = Q$, solving $C'(Q) = P_w$. We show that P, the new local price, must be equal to $(P_w + t)$.

Suppose $P > (P_w + t)$. Then nobody buys from the monopolist. Hence, $P > (P_w + t)$ is impossible. Let $P < (P_w + t)$ and $P = f(Q_L)$. $\hat{Q}_w = Q - \hat{Q}_l$. Suppose now, the local firm transfers one unit of output from the global to the local market. It loses P_w and gains a marginal revenue defined as $mr(\hat{Q}_l)$ at $\hat{Q}_l$ This $mr(\hat{Q}_L)$ has to be *lower* than P_w because $P_w = mr(Q_L)$ at $P_m = f(Q_L)$ and $P < P_{w+t} < P_m \Rightarrow \hat{Q}_L > Q_L$. As mr curve is downward sloping $mr(\hat{Q}_l) < mr(Q_l)$. Hence, the firm would always like to *cut back* local sales as much as it can till it reaches Q_L, the first-best with $mr(Q_L) = P_w$. But now it faces a limit at (P_w+t) and would definitely produce only up to $\bar{Q} = f(P_w+t)$. There is no way that the local monopolist would charge a P *lower than* (P_w+t) as mentioned in Patibandla (1995) leaving the only possibility that $P = P_w+t$. This completes the proof.

To conclude it can be rightfully asserted that the theoretical point we wanted to make is the only result consistent with the profit maximisation hypothesis. Patibandla (1995) uses a different model with intermediates and gets different result. The remarks regarding our analytical framework do not stand valid as they fail to note the determination of the optimal pricing rule.

IIMB

तेजस्वि नावधीतमस्तु

Indian Institute of Management Bangalore

invites applications for admission to the FELLOW PROGRAMME IN MANAGEMENT (equivalent to Ph.D.) starting July 1996

The Fellow Programme is a full time residential doctoral level programme designed to equip students for careers in teaching, training and research in functional and sectoral areas of management. The Fellow Programme students can select their specialisation from the following areas and sectors :

AREAS ❑ Corporate Strategy and Policy ❑ Economics and Social Sciences ❑ Marketing ❑ Organisation Behaviour, Personnel Management and Industrial Relations ❑ Finance & Control ❑ Production & Operations Management ❑ Quantitative Methods, Information Systems & Computers.

SECTORS ❑ Agriculture and Rural Development ❑ Education ❑ Energy and Power ❑ Health and Population ❑ Human Settlement and Environment Studies ❑ International Management ❑ Transportation.

ELIGIBILITY * A Master's Degree with a minimum of 55 per cent marks (or equivalent recognised qualification). Candidates appearing for final degree exams can also apply, provided they complete the examinations and all other requirements for the degree on or before June 30th 1996.

OR

* First Class Bachelor's Degree in Engineering / Technology or a Second Class Bachelor's Degree in Medicine with a minimum of 2 years experience.

In addition, FPM applicants must also satisfy the eligibility requirements of the Post-Graduate Programme of IIMB (For details see CAT advertisement appearing separately). * PGPs from IIMs with minimum CGPA 4.5/6 or equivalent are exempt from CAT and first year course work.

FINANCIAL SUPPORT * Stipend of Rs. 1800/- or Rs. 2400/- P.M. depending on qualifications and experience to cover average monthly living expenses (including fee, room & board)of about Rs. 1400/- . Further an annual contingency allowance of Rs. 5000/- will also be provided.

⇨ **HOW TO APPLY:** *Step 1.* Take Common Admission Test (CAT) on 10 December 1995. *Step 2.* Obtain admission forms free of cost from FPM Office, Indian Institute of Management Bangalore, Bannerghatta Road, Bangalore - 560 076 and apply.

Requests for forms must be accompanied by a self addressed envelope (size 9"x12") affixed with stamps worth Rs. 11/- and a self address slip.

⇨ **LAST DATES :** To receive requests for application forms : 31st October 1995.
To receive completed application forms : 30th November 1995.

Lalbaug Marg, Lower Parel, Bombay 400 013.
Road, Bombay 400 001.

IDBI ASSURANCE. ANYWAY YOU LOOK AT IT!

Every month.
Every quarter.
All at the beginning.
All at maturity.

YOUR FOUR-WAY OPTION WITH IDBI'S FIXED DEPOSIT SCHEME*

TYPE	MINIMUM DEPOSIT	YIELD STRUCTURE
Monthly Income Option	Rs 18,000	Rs 195 every month on a 5 year deposit of Rs 18,000
Quarterly Income Option	Rs 10,000	Rs 325 every quarter on a 5 year deposit of Rs 10,000
Lumpsum Discounted Interest	Rs 10,000	You will get Rs 4,572 immediately on a 5 year deposit of Rs 10,000
Cumulative Option	Rs 10,000	A Rs.10,000 deposit becomes Rs 18,958 in 5 years

**Interest upto Rs 13,000 on the above deposits is tax-exempt under Section 80L of the Income Tax Act, 1961*

MINIMUM DEPOSIT: Rs.10,000

Beyond the minimum amount, you can deposit in multiples of Rs 1,000. The base interest rate for a three year deposit is 12.5%. And a deposit period of five years and more fetches a base rate of 13%. What's more this deposit comes with the guarantee of India's premier development bank - IDBI. Reflected in the FAAA rating by CRISIL given to this product indicating the highest degree of safety. Naturally, an organisation that has total assets of over Rs 36,000 crores can take very good care of your investment. For more details contact your nearest IDBI office or any authorised IDBI agent.

CRISIL RATING FAAA Pronounced F Triple A

This opportunity is open to: * Resident Individuals * Hindu Undivided Families * Partnership Firms * Companies/Bodies Corporate/Societies * Trusts/ Association of Persons.

India's pioneer Mutual Fund sponsored by the largest bank offering :

- Total funds managed : over Rs. 3,000 crores
- Over 25 lakh investors
- 19 handsomely rewarding schemes and 2 Offshore Funds
- A large number of NRI investors
- Support of SBI group branches for collections
- 13 Investor Service Centres nationwide
- Continuous improvement in investor service by constantly improving systems, technology, infrastructure and service
- A direct link to the Registrars' database through modems to reduce response time to investor queries
- Quick, reliable and warm service
- A philosophy of caring for the small investor by offering high safety and easy liquidity

5 schemes redeemed at attractive values.

Privatising Natural Resources

Having joined the globalisation bandwagon, it is not surprising that recent attempts at privatisation in India reflect the quintessential features of the process of using the state to transform natural resources into means for primitive accumulation by domestic and foreign interests. In at least four areas in the recent past there has been clear evidence of deals and attempts at deals which involve the transfer of publicly-owned resources to private hands on terms which are more than generous to the private parties and involve substantial losses in potential income as well as other costs to the public exchequer. **2351**

Occupational Change

Data on the occupational structure of the population from the 1991 Census have just been released. While the 10-year period covered by the 1981 and 1991 Censuses is not enough for structural patterns to manifest themselves clearly, one may expect to discern some shifts. Have these shifts been along the directions to be expected in an economy undergoing the process of industrialisation? **2375**

Beyond Body-Count

If the situation in Kashmir is to be measured in terms of the casualties suffered by the militants, the over 600 killings in the last two months should go to support the official claims about an improvement. However, elimination of militants does not always lead to elimination of militancy. **2354**

IITs' Solitary Splendour

That the IITs have a unique place in the Indian higher education system does not have to be emphasised. What needs to be done, however, is to encourage them to break their isolation from the rest of the university system. **2389**

Municipal Reform

The 74th Constitutional Amendment accorded, for the first time, constitutional status to municipal government, but the municipal management system operates outside the mandated structural reform and there is a latent contradiction between the reformed institution and the colonial-style management. **2395**

Economic Crystal-Ball

In an overall assessment of the Indian economy, the continued industrial recovery, despite some prospect of a slow-down, is a matter of satisfaction. However, persistence of inflation and the widening fiscal and trade gaps are matters of concern. **2355**

Colonial Logic

The annual 'Dangi Darbar', generally held just after Holi, was started by the British with the objective of co-opting and appeasing the Bhil rajas in exploiting the resources of the Dangs. The logic behind the continuation of this institution after independence has remained the same. **2360**

After Mathura

The Mathura episode showed how much the political scene in UP has changed since the Ayodhya days. The BJP had apparently hoped to consolidate and widen its constituency in the context of the breaking up of the then-ruling alliance and the dependence of the new government on its support. These expectations have, however, failed to materialise. **2358**

Damming the Himalayas

From a purely hydrological point of view, storage and wider distribution of the great amount of water that flows in the Himalayan rivers during the monsoon provide an excellent solution to the ever-increasing water demands from the plains of the Ganga-Brahmaputra basin. However, two environmental peculiarities of the Himalayas – high sediment load and high seismic risks – demand that decision-making cannot be guided exclusively by hydrological objectives. **2367**

Labour Blues

The first Monday of September is Labour Day in the US, a national holiday. This year, far from any celebration, there was grave concern all round about organised labour facing a crisis of survival. **2364**

The destruction of coal mining and mining communities in Britain has left a trail of human decline. **2365**

LETTERS TO EDITOR

Vakkom Moulavi

THIS letter serves to clarify a point in the article by Thomas Isaac and Michael Tharakan on 'Kerala: Towards a New Agenda' (August 5-12). In a reference to my paper on the 'Reform Agenda of Vakkom Moulavi', the authors wrote: "Vakkom Moulavi held that the laws of Islam concerning temporal matters were not *commutable*, and hence..." (p 2000). In fact, the sentence should have been "the laws of Islam concerning temporal matters were not *immutable*, and hence...". The sentence, as it appeared in *EPW* makes the opposite meaning. It may be that a typographical error inadvertently crept into the article.

Another point is that Vakkom Moulavi is known more as a great social and religious reformer than as an associate of Ramakrishna Pillai. In fact, Moulavi launched his *Swadeshabhimani* (patriot) in 1905 at Vakkom and Ramakrishna Pillai joined the newspaper only in 1907. However, this is not to belittle the stature and contributions of Ramakrishna Pillai, but to stress the point that Vakkom Moulavi's spectrum of activities is considerably broader than it is usually referred to.

K M SEETHI

Kottayam

Civil Society

IN his article (August 5-12) Ajit Roy discussed the potential of the institutions of 'Civil Society' in resisting the forces of globalisation. In this connection, he expressed his faith in the "development of working class action in the core sector of capitalism" and the "linkage of the relatively peripheral struggles to the struggles in the core sector". Roy had given credit to Antonio Gramsci for his insights on the role and dynamics of 'Civil Society'.

Gramsci characterised Civil Society as a contested terrain. So, while projecting the potentialities of Civil Society, he was also conscious of its limits. He categorically mentioned in his *Prison Notebooks* (pp 220-21) the possibility of appropriation of political parties and trade unions in safeguarding "the political and economic domination of the ruling classes". In his article, 'The Turin Workers' Councils', reprinted in Robin Blackburn(ed), *Revolution and Class Struggle* (Fontana/ Collins, 1977), he wrote:

> The true process of the proletarian revolution cannot be identified with the development and action of revolutionary organisations of a voluntary and contractual type, such as the political party or the trade unions. These are organisations born on the terrain of bourgeois democracy and political liberty, as an affirmation and development of political freedom (p 378).

Gramsci actually saw the liberation of workers in the birth of Factory Councils, which represent the aspirations of the workers at the grass roots level. In order to promote workers' democracy, he thought of a meaningful dialogue between the party, the trade union and the Factory Council. But, while stating the revolutionary potential of the Factory Council, Gramsci categorically warned that "the party and the trade union should not impose themselves as tutors or ready-made superstructures for the new institution, in which the historical process of the revolution takes a controllable historical form".

India's Loss of Freedom

A press report about P V Narasimha Rao goes as follows: "Be it the communists, the Janata Dal or the BJP, they are all trying to attract foreign investment in the states ruled by them", he has said in response to opposition criticism of his policies. "They are all going to New York and Davos (Switzerland to attract investment). They are all doing what we are doing. Then where is the mistake" (*India Abroad*, August 4, 1995, p 4). But because the opposition parties are also doing the same ignorant and stupid thing does not mean there is no mistake. Advocates of foreign help, whether by way of technology or investment, fail to ask this elementary question: from where did these 'advanced' countries get their technology and capital – who helped them? Their technology and their capital are, by and large, products of their behaviour. Trying to advance India's interests by taking technology and capital from abroad is like a student writing answers to questions in an examination by having the answers whispered in his ears by someone else. Not only will the student not have learned anything, but will have lost money and freedom to his accomplice who may gain profound control over him. Mahatma Gandhi's prescription of swadeshi was not a prescription for 'backwardness'; it was a prescription for getting out from under such control. For the same reason he prescribed 'non-co-operation' (today it will be 'non-collaboration', as in the myriad technical collaborations that Indian enterprises, in both the public and private sectors, routinely indulge in) and shunning colleges set up by the British (today it will be places like Harvard and MIT – whose provost was recently appointed director of the CIA). The ever-increasing – though unnecessary – dependence on foreign sources of knowledge is the most profound and dangerous aspect of India's loss of freedom.

Uneasy Portents

THE sharp and sudden fall in the rupee's exchange rate *vis-a-vis* the US dollar in the last fortnight has evidently taken the government and the Reserve Bank by surprise. The authorities had been taking credit for the stability of the rupee-dollar rate for almost 30 months since March 1993, except briefly in March this year when there was a bunching of demand for foreign exchange and some speculative pressure on the rupee. The rupee-dollar rate has indeed been relatively stable after the dual exchange rate was replaced by a unified rate from March 2, 1993, with all foreign exchange transactions being effected at the market rate. After the exchange rate was freed the rupee had begun trading at Rs 32.07 per dollar and then steadily gained strength and got anchored at Rs 31.37 per dollar in July 1993. It remained at that level till the end of October last year, or for a continuous period of 16 months. This was the outcome of active intervention by the RBI which mopped up foreign currencies worth as much as $24.24 billion – $13.94 billion in 1993-94 and another $10.30 billion in 1994-95 – in terms of gross purchases from the market.

While the claim of stability of the exchange rate of the rupee is technically valid, it was made possible by two special factors: First, the surge in foreign exchange reserves, essentially the result of portfolio investments from abroad and inflows on account of global depository receipts (GDRs), and; second, the RBI's decision not to allow the rupee to appreciate against the dollar, despite the accumulation of foreign exchange reserves. The situation was termed as a "temporary condition of excess supply", whereas it was stressed, the objective of exchange rate policy was "to allow the rupee to reflect economic fundamentals". More simply, the focus of exchange rate policy has been to support exports and so the rupee was not allowed to appreciate even though for a fairly long period during 1993-94 and 1994-95 actual exchange market conditions were such as would have ordinarily resulted in the rupee's appreciation.

Allowing the rupee to find its own level in the market beyond the anchor rate of Rs 31.37 per dollar has been thus the avowed policy of the authorities, irrespective of what happens to the real effective exchange rate and the repercussions of currency depreciation on the rest of the economy in terms of inflation, addition to the debt burden, further depressing of low real wages, widening of income and asset disparities, transfer of real income abroad and lowering of the domestic saving rate.

Once the flow of foreign exchange slowed down towards September-October 1994 and the RBI ceased to intervene, the thinness of foreign exchange liquidity in the market got reflected in two developments: the rupee-dollar rate moved away from the anchor rate of Rs 31.37 and the forward premium for the dollar in the Indian inter-bank market began to firm up. The RBI reference rate, which is based on the quotations of a few selected banks in Bombay at noon every day and which is applicable to SDR transactions and transactions routed through the Asian Clearing Union, moved up from $31.37 and generally ranged between Rs 31.38 and Rs 31.44 up to the end of July. With the growth of liquidity slowing down and the demand for bank credit picking up, commercial banks began to augment their rupee resources by taking recourse to swaps. The six-month annualised forward premia, which had hovered around 2 to 3 per cent until October last year, began to look up and have ranged from 5 to 7.75 per cent during this year so far. Incidentally, the depreciation of the rupee in terms of the dollar during this period took place despite the rapid depreciation of the dollar against the deutschmark and the yen – the latter particularly, with the dollar-yen rate slipping below 80 yen by the end of June.

Likewise the Indian authorities' claim now that the accelerated depreciation of the rupee *vis-a-vis* the dollar after September 5 is attributable to international currency movements and that the rupee has not depreciated against major currencies other than the dollar is hardly convincing. The rupee's depreciation has been sharp and has covered all major currencies. The RBI's reference rate for the dollar jumped from Rs 31.94 on September 4 to Rs 32.13 on September 5 and has risen steadily since then to touch Rs 33.84 on September 22. In between the rupee sank as low as Rs 35.15 on September 15 when the RBI reference rate for the day was Rs 34.15. In this period when the rupee depreciated against the dollar by about 5.7 per cent, it also depreciated against the deutschmark by the same 5.7 per cent from Rs 21.89 to Rs 23.22 and by 7.1 per cent from Rs 49.84 to Rs 53.59 against the pound sterling. It is only against the yen that the value of the rupee has remained by and large unchanged (between Rs 0.3273 and Rs 0.3244) because the appreciation of the dollar against the yen was also sizeable during this period (the dollar-yen rate moving from 97.4931 yen to 103.8509 yen, an appreciation of the dollar by 6.5 per cent or depreciation of the yen by 6.1 per cent). The deutschmark too fell against the dollar, but only fractionally by 1.7 per cent.

The latest depreciation of the rupee has to be viewed in the context of certain other developments. Portfolio investment by FIIs is again beginning to look up (net monthly investment having gone up from $10.9 million in November 1994 to $208.7 million in July and $182.2 million in August this year) and the flow of foreign direct investment (FDI) too has been

sizeable (Rs 2,862 crore in the first five months of 1995 against Rs 2,972 crore during the whole of 1994). The foreign exchange reserves (other than gold) standing at $19,075 million appear comfortable. Despite these developments, the RBI has chosen not to react though the rupee has depreciated beyond the 5 per cent limit. This is not in keeping with its declared policy which has been reiterated in its latest *Annual Report*: "The Reserve Bank quotes its buying and selling rates which are in tune with the market rates and which can move within a 5 per cent band of the prevailing market rates. The RBI at its discretion intervenes in the market, to ensure that orderly conditions prevail in the market." All these norms seem to have been violated by the recent movements in the rupee's exchange rate without evoking a reaction from the central bank.

At the current bilateral exchange rates for the rupee, the trade-weighted real rate (TWER) is likely to have declined in real terms below the TWER established after July 1991, when it was worked out at 60.56 (base 1985=100). The latest data available for June place it at 63.84. In nominal terms the TWER for July 1991 was 50.91 which had declined to 41.20 by June this year. Clearly, the government has been following a policy of ensuring that the rupee remains undervalued on considerations of protecting export competitiveness.

Apart from the thinness of the foreign exchange market due to the government's decision to route all its non-IMF debt servicing (nearly $2.5 billion or Rs 5,916 crore of repayment plus interest payments) through the market, there are signs that the so-called stability of the 'underlying fundamentals' in relation to the country's balance of payments is beginning to get disturbed. In fact the latest data on external trade and balance of payments suggest that the economy may have once again entered a phase of galloping imports and large current account deficits. While exports rose by 17.9 per cent in dollar terms in 1994-95, non-POL imports jumped by 27.4 per cent and the trade deficit based on BOP data reached $3.95 billion, which was three times the deficit of $1.29 billion in the previous year. The current account deficit similarly rose from $315 million to $2.08 billion. Merchandise trade data for the current year show that non-POL imports have shot up by 44.1 per cent during April-July while exports rose by 29.9 per cent, widening the trade deficit to $1.53 billion against $594 million in April-July 1994. Apart from the debt service obligations of over $12 billion in each of the next three years, another signal which does not augur well for the BOP scenario is that outflows under two heads of invisibles, namely, 'travel' and 'investment income', have begun to rise rapidly. Payments under 'travel' jumped from $385 million in 1992-93 to $750 million in 1993-94 and $1,205 million in 1994-95. Likewise, the outgo under 'investment income' increased from $3,799 million to $4,300 million and further to $5,009 million. Payments under the head transportation too went up from $1,485 million to $2,250 million and $3,016 million. The only saving grace has been the impressive accruals under private transfers which rose from $2,784 million to $3,850 million and $6,220 million. The financing of imports, both legitimate and clandestine, of gold, silver and consumer durables, accounts for not less than $3.5 to $4 billion annually in foreign exchange through the 'havala' trade. The 'havala' rate has shot up from Rs 35 to Rs 37 per dollar after the latest rupee depreciation. After all the hoopla about external sector adjustment and elimination of 'havala' trade, this is indeed significant. All things considered, the prospects are that, in the name of further adjustment, the country will soon face another bout of currency depreciation – as much to take care of the accelerated inflation rate which has been a factor contributing to the repeated depreciation of the rupee in the past.

POLITICS

Shaky Structure

PRIME MINISTER Narasimha Rao's Kamaraj Plan – the recent reshuffle of his council of ministers – ostensibly claimed to be an effort to redirect the expertise of senior Congress leaders from ministerial responsibilities to the task of toning up the party organisation, has turned out to be yet another exercise in the tightrope-walking that Rao has specialised in. As all such exercises, the present one also is fraught with uncertainties, now that Rao has tied himself up with unreliable allies among the newly inducted ministers, and disgruntled foes among those who have either been ousted or shunted off to new departments.

To start with, Rao's original plan has not worked out to his satisfaction. He wanted to purge the cabinet of heavyweights who were proving to be difficult for him – agriculture minister Balram Jakhar, civil aviation minister Ghulam Nabi Azad and railways minister Jaffer Sharief. He also reportedly wanted to shift home minister Chavan to defence, and give the home portfolio to Karunakaran. None of them apparently agreed to give up their plum positions and Rao had to be contented with 'obtaining' resignations from nonentities like Ajit Panja, Krishna Kumar, Tarun Gogoi, Basav Rajeshwari and P K Thungon. Although not powerful enough to pose a threat to Rao, some among these ousted ministers are quite capable of retaliating by queering the pitch organisational politics in their respective states. Ajit Panja, for instance, has already started the process in West Bengal by dropping veiled hints in public that external affairs minister Pranab Mukherjee was behind his ouster from the union cabinet. In the faction-ridden West Bengal Congress, Panja has apparently found enough supporters who, at a public meeting organised by the party in honour of the prime minister in Calcutta, raised slogans against Mukherjee. Ajit Panja's ouster is likely to further fragment the precariously balanced structure of the West Bengal Congress organisation.

At the centre also, a similarly shaky structure in the form of the existing union cabinet is being sought to be revamped by Rao, but again through a patchwork of balancing acts. The new faces which grace his council of ministers are a medley of individuals, not known for any firm ideological commitment to any cause, but more identified with certain powerful factions within the party, or selected on the basis of their respective regional, religious or casteist origins.

What is intriguing is the induction of R K Dhawan into the council as minister of state (with independent charge) for urban development. The name of this gentleman is still under a cloud and has not been cleared since the comment made by the Thakkar Commission (appointed by the Congress government to inquire into Indira Gandhi's assassination) naming him as the person towards whom the 'needle of suspicion' was pointed. But Dhawan had evidently managed to worm his way into favour with the Congress hierarchy. Sacked by Rajiv Gandhi after Indira Gandhi's death, he bounced back when Rajiv sought his help and reappointed him on his staff – significantly during the crisis over the Bofors scandal that Rajiv was facing. Dhawan's re-entry into Rao's ministry strengthens the popular suspicion that his being privy to many secret Congress deals over a long period – from Indira Gandhi's regime in the late 1960s to Rajiv's in the 1980s – makes him an indispensable crutch for Congress prime ministers who inherit the legacy of corruption and who need hustlers to bail them out whenever they are in a fix.

As for the other newly appointed ministers, an examination of their past and present activities indicates Rao's inclination to appease some from among the amorphous crowd that hovers around Sonia Gandhi, some from the different religious, regional and caste backgrounds and some who had been opposing his arch rival Arjun Singh. Sardar Singh Ahluwalia and Suresh Pachouri, ministers of state for urban affairs and defence production respectively, are known to be close to 10 Janpath. There has

been adequate representation from the Muslim and scheduled caste communities. Some like Aslam Sher Khan, the youngest entrant into the council of ministers, have been rewarded for breaking with Arjun Singh.

But even after all this, one doubts how long Rao will be able to sustain the balancing act. His vendetta against Rajesh Pilot for unleashing the prosecution process against his patron-godman Chandraswami, has further exposed Rao to attacks from both the opposition and within his own party.

EXCHANGE RATE

Hidden Agenda

A correspondent writes:

THE ink had hardly dried on the RBI's *Annual Report* claiming the stable exchange rate of the rupee as one of the principal factors responsible for the export performance of 1994-95 and the 'large' capital inflows in the second half of 1993-94 and the first half of 1994-95 than the exchange rate of the rupee *vis-a-vis* the US dollar took a downward plunge of 12.5 per cent within a matter of days. For the first time in the past four years after the sharp two-stage devaluation in 1991, the rupee has taken a plunge against the dollar, the currency to which it had stood virtually pegged, thanks to the exchange rate policy pursued by the authorities, lip-service to market forces notwithstanding. Although the authorities have disavowed market intervention from time to time the fact remains that it was in pursuit of the policy of not allowing the rupee's exchange rate to appreciate that the RBI went on accumulating foreign exchange reserves even though it posed for the central bank "problems for the conduct of monetary management". To say that the authorities forswore market intervention in order to support the exchange rate is simply not borne out by the 'experience of the past four years. What they had so far been doing through their operations was to keep the rupee's exchange rate depressed in spite of the external demand for the rupee generated by capital inflows. Now, when the tide is threatening to turn the other way, the authorities are taking cover behind their professions of non-intervention. This current disavowal of intervention now really amounts to an implicit approval of the rupee's depreciation.

The finance minister and the officials of his ministry see no cause for alarm in the depreciation, sharpest in the past four years, and assure us that the rupee would soon stabilise at "a satisfactory level", without any indication of the level the authorities would consider satisfactory. It is obvious, however, that neither the finance minister nor his officials are prepared at this point of time to commit themselves to an exchange rate for the rupee, any downward slide from which would trigger intervention with the help of the foreign exchange reserves that have been accumulated over the recent past. After all, the whole purpose of foreign exchange reserves is supposed to be to ensure a steady exchange rate and that is possible only through a policy of intervention with the help of these reserves.

Given this refusal to commit themselves to the level where the authorities would like to see the rupee's exchange rate stabilised and which level the authorities would feel obliged to support, would it be unreasonable to suspect that the rupee might be allowed to slide even below the Rs 35.15 to a dollar level that it reached at one point last week? Here it is pertinent to add that the authorities themselves are supposed to have created the present situation by requiring the SBI and the IDBI to go to the market to meet their foreign debt servicing obligations. A signal was believed to have gone thus from the authorities. Of course, it could be argued that this would be quite consistent with the unspoken pursuit of the policy of keeping the rupee's exchange rate permanently depressed, unmindful of the losses such a policy entails for the economy on account of adverse terms of trade and the mindless pursuit of larger and still larger foreign exchange reserves, a pursuit that is not only highly expensive but also increases the vulnerability of the economy, given the type of capital inflow on which much of this accumulation has depended. The RBI's *Annual Report* itself speaks of the "exposures to volatility" and the difficulties in the conduct of monetary policy which capital inflows create.

Let us not forget in this context that a 29 per cent increase in export earnings during the first four months of the current fiscal year, even though alongside it there has also taken place a 39 per cent increase in the import outgo, cannot by any measure be regarded as a sign of any erosion of the economy's relative cost advantage to justify the rupee's depreciation. The present downward slide of the rupee, one is driven to suspect, is an officially engineered slide in pursuit of the policy of keeping the rupee perpetually depressed.

PANCHAYATI RAJ

How Serious Is the Centre?

NO time is ever lost by Congress(I) spokesmen, be they ministers or party functionaries, to claim credit for ushering in panchayati raj. But they conveniently forget that it is the Congress(I) ruled states which have proven to be the most reluctant to pass the legislation necessary, in pursuance of the constitutional amendments, to hold elections to the new local bodies to be created under such legislation and to devolve powers and finances to the bodies which have at last come up. Most state administrations have seen to it that no effective devolution comes about during their current five-year tenures. Of course, what is true of the Congress(I) ruled states is no less true of opposition ruled states with the solitary exception so far of West Bengal, a state which it must be said did not need to be pushed into devolution to local bodies by the constitutional amendments.

In the circumstances, how seriously does one take pronouncements from the centre urging state governments to devolve more and more of their local level development functions? At a two-day workshop in Delhi of state project directors, the minister for rural development and employment, Jagannath Mishra, is reported to have urged the state governments to bring the district rural development agencies (DRDAs) "under the overall supervision, control and guidance" of the zilla parishads, with the chairman of the parishad as DRDA chairman. On the face of it, this recommendation to the state governments sounds impressive in that the major district level agency, through which all funds flowing in from the centre for various centrally-sponsored schemes, is thereby sought to be brought "under the overall supervision, control and guidance" of the zilla parishads. What should not be forgotten, however, is that already some at least of the state legislations have gone far ahead of what the centre is now so belatedly trying to secure – and that too half-heartedly. In Karnataka, in Ramakrishna Hegde's time, the panchayati raj legislation deemed the district level panchayat as the DRDA. The same was done through executive action in West Bengal. Thus in effect the DRDA was done away with as a distinct agency and the district level panchayat made the agency through which the central schemes were to be implemented. In this manner, one and only one agency had the responsibility to undertake development tasks within a district.

What the centre now seems to be doing is to put its stamp of approval on the tendency among most state governments to keep the DRDA as separate and distant as possible. Asking the states to let the zilla parishad chairman also be the DRDA chairman will not bring the DRDA projects under the parishad's effective "supervision, control and guidance" (let us not forget the word "overall" used by Mishra). Only the Hegde formula will achieve that. But is the centre genuinely interested in such an outcome?

Foreign exchange reserves, now $19.08 billion, have declined by $1.74 billion since the beginning of the fiscal year. The current account deficit in BOP crossed $2 billion in 1994-95 against $315 million in 1993-94. During April-July this year, the trade deficit exceeded $1.5 billion. Under non-factor services, while receipts under 'travel' rose from $2.1 billion to $2.3 billion, payments under the same head galloped from $0.7 billion to $1.2 billion. While private transfers bolstered the BOP through a rise in net receipts from $3.8 billion to $6.2 billion, net outgo under investment income remained sizeable and rose from $4 billion to $4.2 billion. The exchange rate has experienced a sudden fall from Rs 31.85 to the US dollar at end-August to Rs 33.51 on September 15, a depreciation of about 5 per cent.

CROMPTON GREAVES

Foreign Tie-Lips

CROMPTON GREAVES, the flagship of the Thapar group and one of the largest private sector electrical engineering firms, closed its fiscal year ended March 1995 with a turnover of Rs 999 crore, up by 20 per cent from Rs 828 crore recorded last year. Interest costs came down by 10 per cent from Rs 41 crore to Rs 37 crore. Rise in provision for depreciation from Rs 11 crore to Rs 16 crore coupled with a rise in tax provision from Rs 8 crore to Rs 17 crore did little to dampen the bottomline which rose from Rs 31 crore to Rs 43 crore.

Exports were up from Rs 92 crore to Rs 96 crore and imports rose from Rs 59 crore to Rs 83 crore. Raw material were 90 per cent of total imports. To give a further boost to exports, the company laid special emphasis on strengthening the quality systems and is working towards obtaining the ISO 9000 accreditation for its operations At present 18 divisions of the company have been accredited with the ISO certification. A dividend of 35 per cent has been recommended by the directors against 30 per cent last year.

During the year under review, the company's three new units – at Goa for manufacture of LT motors, FHP motors and fans, and traction motors, at Baroda for light sources and at Nashik for zinc lightning arrestors – started commercial production. Production of DC/AVS motors at the motor factory at Ahmednagar and of the non-silicon range of electrical steel stampings at the stampings factory at Bombay also began in 1994-95.

Having identified telecommunications as the thrust area for the future, the company is planning investments of up to Rs 600 crore in its different telecom ventures. The company also plans to enter the basic telecom services. "We want to be aggressive in the telecom sector", according to Nohria, managing director. The company has signed a memorandum of understanding with NEC of Japan for manufacture of fibre optic online terminal equipment to be made at the company's Bangalore plant. It has also signed technical agreements with two Israeli companies to provide LAN and WAN services to the corporate sector Marketing of facsimile machines under its own brand name, with subcontracting arrangement with Daewoo, a joint venture with Bellsouth Milicom of Denmark for value added services like cellular phones and electronic mail are some of the plans of the company The company has entered into an alliance with Packard Bell, a major personal computer manufacturer based in California, to manufacture high quality computers in India. With this alliance CG Informatics, a division of Crompton Greaves, is launching a new line of high powered Packard Bell products.

The company has tied up with AT&T Paradyne, a division of AT&T, USA, a leading player in the data communication products worldwide, to market the latter's entire range of data communication and networking products in India.

Crompton Greaves has tied up with Periphonics Corporation of the US to market its range of advanced voice processing systems. The company is partnering Siemens, Germany, for its telephone instruments, NEC and OKI Electric, Japan, for its data comproducts and Mobile Telesystems of the US for its satellite communications. Periphonics Corporation is one of the largest suppliers of the interactive voice systems in the US. According to senior director Don Kaiserman, "We view India as one of the largest markets of the future".

During the year under under review, the company floated a joint venture project with NEC of Japan to make main switches. Similar switches are also made by Siemens, AT&T, Ericsson and ITI through an agreement with Alcatel. The company has two technology transfer agreements with NEC for wide-band transmission systems such as optical fibres and microwave transmission equipment. The optical fibre project to come up at Jigani is estimated to cost Rs 20 crore. Telecommunication equipment is manufactured at Pithampur, Madhya Pradesh, Chandigarh, Goa and Bangalore. The company manufactures products for private and public networks including value added services.

A Rs 2.4 crore new switchgear plant, jointly set up by Crompton Greaves and W-Lucy, the oldest electrical company of UK, was inaugurated at Ambad industrial belt, Nasik According to Noharia, the new joint venture. CG-Lucy, will manufacture medium voltage distribution switchgear called ring main unit. This will be the second joint venture between the two companies, the first also being on a 50:50 basis. Under the first, manufacturing facilities have been set up in Nasik to make medium voltage ring main units (RMUs). Along with being a financial partner, W Lucy is providing technical knowhow under a separate agreement. W Lucy is a 235-year old company and is a world leader in medium voltage distribution switchgear.

The company continued its efforts to develop new products like electronic speed governers for hydel and steam turbines, cogeneration packages for the sugar industry, solid state interlocking for railway yards, block multiplexer for data communication for railway signalling, upgradation of soft starters and transformer technology absorption of AVS controller from Powertec, USA, micro-processer based trip relay controllers for air circuit breakers and micro-processer based test and measuring instruments. The company spent Rs 7 crore on research and development.

J K CORP

Diversification and Expansion

In 1938 the Singhania group set up Straw Products to manufacture straw board from wheat straw. Successful diversifications led the company into the feilds of paper, cement, polyester staple fibre and polyester filament yarn and magnetic tape. A decision by the directors taken in order to reflect the company's multi-dimensional activities and its growing corporate stature led to the re-christening of Straw Products and J K Corp (JKC) was born.

The company closed the financial year ended March 1995 with a sales turnover of Rs 426 crore against Rs 365 crore in the previous year, a rise of 16 per cent. Other income rose significantly by 60 per cent, from Rs 10 crore to Rs 17 crore. The combined effect of the two was reflected in the total income which increased by 15 per cent from Rs 378 crore to Rs 435 crore. A zero tax provision saw the company close the fiscal year with a net bottomline of Rs 52 crore against Rs 33 crore in the previous year. A dividend of 30 per cent has been declared by the directors.

In 1994-95, 35 per cent of the company's sales were of paper. Of the rest 21.7 per cent from the PSF division, 19.4 per cent from the PFY division, 19.3 per cent from the cement division and 4 per cent from magnetic tapes.

Production of paper stood at 66,755 tonnes against 62,800 tonnes in the previous year. With the commissioning of a new speciality paper machine, JKC raised its capacity from 60,000 tpa to 75,500 tpa. To increase volume and reduce cost while simultaneously improving quality, the company is installing a brand new pulp mill of 300 tdp based on the latest technology, upgrading some of the existing paper machines and installing a new one are the other plans in the offing, estimated to cost Rs 450 crore. As a result, the company's manufacturing capacity is to increase from the current level of 50,000 tonnes to 1,25,000 tonnes. These expansions are likely to go on stream by mid-1996. JKC is presently engaged in the manufacture of

commercial type paper varieties like copier, laser, bond and others, which account for 90 per cent of its sales of paper, the balance coming from pulp board. JKC is currently the biggest manufacturer of copier paper in the industry.

Production of cement for the year under review stood at 5.64 lakh tonnes. According to the company, it would have been higher were it not for heavy rain in the factory area on account of which operations suffered. A new cement unit of 9 lakh tonne capacity was commissioned in March 1995, taking total installed capacity to 1.5 million tonnes. The unit was set up with technical assistance of Blue Circle Industries plc, UK. The expanded capacity has a pre-heater and a calcinator which will increase its operational efficiency significantly.

Orissa Synthetics, the company's polyester fibre division, enhanced capacity from 23,000 tpa to 28,200 tpa in September 1994 and is expected to further raise it to 38,000 tpa by March 1996. High cotton prices as a result of a poor crop have turned more and more people towards synthetic fibre. A strike in the last fiscal quarter of 1994-95 adversely affected the working of the division, but the unit has now returned to normalcy. Growth will be maintained in the near future, with demand for polyester on the rise and the company's plans to make value added products.

The company introduced India's first cobalt tape. It has trebled production over the past few years and the plant has been working continually at over 100 per cent capacity utilisation. A GDR issue of $ 55 million was made successfully and will be utilised for funding a part of the expansion plans with the rest of the need being met through internal accruals.

The company was accredited with ISO 9000 certification for all its divisions. JK Paper is the first paper mill in India to receive ISO 9001 certification. Lakshmi Cement has recieved ISO 9002 certification. JK Magnetics is the first and only unit in the industry in India to recieve ISO 9002. In the previous year, the company's Orissa Synthetics had been the first unit in the synthetic fibre industry to recieve ISO 9002 for its entire range of products.

TVS SUZUKI

New Models

TVS Suzuki closed the financial year ended March 1995 with a sales turnover of Rs 409 crore as against Rs 272 crore in the previous year, a rise of around 50 per cent. Net profit stood at Rs 32 crore, up from Rs 18 crore in the previous year, a rise of 77 per cent. It would have been higher were it not for a tax provision of Rs 3 crore as against a zero tax provision in the previous year. A

dividend of 25 per cent has been recommended by the directors against 12 per cent in the previous year.

TVS Suzuki, promoted by Sundaram Clayton of the TVS group in 1982, was the first among the Indo-Japanese two-wheeler joint ventures to set up operations in the mid-1980. It has a technical collaboration with Suzuki Motor Company of Japan which holds a 23 per cent stake. The promoters hold 32 per cent with financial institutions holding 22 per cent and the public 20 per cent. The company was the first to launch the 100 cc Japanese motorcycle in India, but lost out to Yamaha and Hero Honda on the way. The plummeting of the rupee-yen exchange rate and a heavy import content resulting in heavy import duties affected profit margins adversely. In addition, problems in fuel efficiency led to the company being almost written off. The final blow came in the form of a 100-day lock-out in 1990. January 1991 saw the company come out with a revival package based mainly on consumer preferences. Instead of catering to a broad mass as in the past, the motto now was to concentrate on specific products for different target groups. Thus was launched the Max 100, the economy model, Max 100 R, the rural version, Samurai, the high fuel efficiency bike, and Shogun, a high powered sleek bike targeted at the younger group. In the mopeds market the company came out with TVS XL and TVS Champ, with the TVS Astra in the up market segment. In the scooters segment it introduced the Scooty (60 cc). The company also revamped the distribution network reducing the number of dealers from 400 to 270 and developed high quality reliable vendors near its factory at Hosur for the manufacture of critical components.

In 1994-95, among the three segments of 2-wheelers, motorcycles have shown the highest growth of 44 per cent followed by scooters at 27 per cent and mopeds by 10 per cent. With sales of 2.02 lakh vehicles, TVS Suzuki leads in the mopeds segment which has had total sales of 5.22 lakh during 1994-95. The company commands a 39 per cent market share in the mopeds segment, ahead of Kinetic Engineering with a share of 23 per cent. The company's share in the highly competitive motorcycle segment has shot up from 8 per cent in 1993-94 to 13.37 per cent in 1994-95.

The company has a disadvantage in that it does not have a four-stroke engine unlike its competitors Hero Honda and Bajaj Auto, which are more fuel efficient. But managing director Venu Srinivasan argues that the company's vehicles satisfy the norms set out for 1996 and an electronic fuel injection system, to be in place by the year 2000, does away with the need for a four-stroke engine. The company has plans to revamp its existing moped models and give them more power without sacrificing on fuel efficiency. It plans to introduce three new models in this segment by the end of the year.

The company plans to sell mopeds in Vietnam through Berkat Corporation, a Singapore-based trading firm, which has marketing infrastructure there. Setting up a plant in Vietnam is on the anvil after popularising its products. TVS Suzuki will sell Astra 60 cc, the veriomatic two-seater bike with kick starter, which has captured the South American market.

TVS Suzuki is to invest Rs 300 crore over the coming few years in keeping with its plan to capture 25 per cent of the two-wheeler market by the year 2000. The plan is to increase production from 2,90,000 two-wheelers (1994-95) to one million in five years.

The company has signed a 3.5 crore purchase agreement with Computervision Corp(CV) of the US for the use of the latter's software to develop world class design for its new range of mopeds and scooters and reduce the lead time from 24 months to 12.

Lakshmi Auto Components, the company's subsidiary manufacturing components for the automobile industry, performed satisfactorily. It closed the financial year with a 46 per cent increase in turnover. Net profit grew by 79 per cent leading the directors to recommend a dividend of 15 per cent against 12 per cent of last year. •

WORKSHOP
ON
"ETHICS IN INDIAN BUSINESS"
14th to 16th December 1995
at Manipal

T. A. Pai Management Institute announces a workshop for senior executives and administrators. The workshop will sharpen their ethical sensibility by sharing and discussing their experiences.

The setting will be very peaceful and comfortable. Prof. S. K. Chakroborthy a renowned authority on this subject will be the main Facilitator.

For brochures contact :

Prof. R. C. Sekhar,

T. A. Pai Management Institute, Manipal - 576 119.

Privatising Natural Resources

Jayati Ghosh
Abhijit Sen
C P Chandresekhar

Having joined the globalisation bandwagon, it is not surprising that recent attempts at privatisation in India reflect the quintessential features of the process of using the state to transform natural resources into means for primitive accumulation by domestic and foreign interests.

SELLING off productive assets has always been the last resort of the economically desperate. In these situations, the degree of desperation of the seller is usually inversely related to the price at which such assets are sold. The most piquant of such phenomena involve those who are already very poor, who have little in the way of alternative sources of income or economic opportunity. Thus, the undervaluation of land and similar collateral in mortgage-based loans in rural India, whereby small holders are deprived of their paltry assets at prices far below their market value, is well known. Similarly, periods of severe economic hardship are typically associated with large-scale distress sales of assets among the population at large, and these sales inevitably are accompanied by reductions in the market prices of such assets.

When such sales of productive assets are conducted not by individuals or groups but by governments of sovereign nations, however, matters are entirely different. In these cases, as is becoming increasingly obvious, the privatisation of state-held productive assets can incorporate a whole range of considerations, of which fiscal difficulties constitute only one part. The wave of privatisation which has spread like a virus affecting governments across the world reflects not only the desire of these governments to earn some quick (and easy) money to ease budgetary constraints, but also the current ideological tendency which decries all publicly held institutions as inherently inefficient and prone to mismanagement. The credibility of a government under this dispensation often depends not on the logic of a specific policy or programme or its end result, but simply on the pursuit of certain policies irrespective of the consequences.

Needless to say, this conservative ideological environment often serves certain parallel aims of those in power. States in capitalist societies, especially the less developed among them, have always been important sites for primitive accumulation by the rich and the powerful. In an underdeveloped economy, a capitalist class unable or unwilling to finance accumulation on its own constantly seeks to use the state as a mechanism for channelling surpluses, garnered from an overwhelmingly poor populace, to the private sector. The fiscal strategy of the state – taxes and subsidies and pricing and investment policies – is geared to that end. With the capitalist class still nascent, this conversion of the state into an instrument for primitive accumulation also allows those in political power to create their own capitalists, meeting in the process the needs of nepotism, clientelism and the like.

Indeed, there is mounting evidence – not only from developing countries but also from the formerly socialist economies as well as developed industrial countries – that the privatisation of state-held assets can be carried out in a manner that inordinately benefits certain groups of purchasers and deprives the state (and therefore also the taxpayers) of the rightful value of such assets. The advantage that buyers enjoy in distress sales is compounded in the case of government sales by further gains from preferential treatment, differential access and other features which stem from closeness to the powers conducting the privatisation concerned. Given this, it is usually certain (privileged and powerful) domestic groups or individuals who are the main beneficiaries of a process from which ordinary citizens are the losers.

More recently, the enhanced subordination, through the aegis of institutions such as the IMF and the World Bank, of most less developed countries to the requirements of international financial and industrial capital has introduced a range of new players into the picture. Either directly as collateral for private sector balance of payments finance (as in Latin America, for example) or indirectly by making foreign companies disproportionate beneficiaries of the sale of publicly held assets in the name of attracting foreign investment and earning scarce foreign exchange, private international interests are also gaining control over the assets in the developing world at prices that show signs of 'enforced' distress.

Unfortunately not all assets in the underdeveloped countries are equally valuable, especially to international players. However, there is one form of tangible wealth that since the industrial revolution has commanded the respect of capital, whether located in the metropolitan centres of capitalism or in the less well endowed periphery. And that is wealth in the form of natural resources that serve as raw materials or intermediates for a range of productive activities. It is this wealth therefore that tends to be targeted in any phase where an ability to 'influence' the state allows its policy to be directed towards furthering the process of private enrichment.

Having joined the globalisation bandwagon, it is not surprising that recent attempts at privatisation in India reflect the quintessential features of this process of using the state to transform natural resources into means for primitive accumulation by domestic and foreign interests through the relative undervaluation of the assets that are being sold. The fact that the sales here concern not produced assets which can be replaced but natural and often non-reproducible resources belonging ultimately to the people of India, lends a particular poignancy to this matter. In at least four areas in the recent past there has been clear evidence of deals and attempts at deals for the transfer of publicly-owned resources to private hands on terms which are more than generous to the private parties and involve substantial losses in potential income as well as other costs to the public exchequer.

One of the most blatant of such cases involves a deal which was struck more than two years ago, the details of which have only recently come to light. In 1992 the ministry of petroleum and natural gas asked for 'offers' — essentially from foreign investors – to develop certain proven oil reserves held by the ONGC. It is important to remember that the ONGC itself has been converted from a statutory authority into a public limited company and, following upon this, an estimated 20 per cent of its equity has been sold to private agents at prices which are as yet undisclosed. The equity of the ONGC which stood at Rs 343 crore in March 1993 was far below both its 'net worth' of as much as Rs 19,613 crore or the value of its proven reserves and production of oil and natural gas, and it may be inferred that the sale of this equity provided a windfall to the fortunate private purchasers.

This divestment of shares notwithstanding, the critical aspect of private gains in this sector has come from another source – the effective sale of proven oil and natural gas reserves of the public sector to private companies. The main settlement in this area is the agreement signed in 1992 by the government of India, the ONGC and the multinational company Enron in collaboration with Reliance Industries. This has resulted in a new company – of which the ONGC is a minority shareholder without any real say in decision-making – to develop the oilfields of Mukta and Panna. These

fields had earlier been discovered, explored and proven by the ONGC, which had incurred substantial costs in setting up drilling capacity, platforms and other facilities. These costs were ultimately borne by Indian tax-payers, through government financing of such exploration and development. The agreement, however, in its provision for returns to costs, effectively wipes out all earlier costs as well as some still being incurred at present by the ONGC, and offers no return to such expenditure. Instead, the contractor (Enron/Reliance) will be entitled to recover all costs at the rate of 100 per cent per annum, until the specified Cost Recovery Limit is met. This sum, which is more than US $ 577 million, is likely to be reached only after five or six years of production, until which time neither the government of India nor the ONGC will have any claim on the oil produced. This means that ONGC will have to contribute 40 per cent of the capital for the new company, but will still have to wait for its share of 'profit oil', and this too is dependent upon the decision of the contractor who can decide when actual commercial production is to start.

This agreement therefore hands over to Enron/Reliance the already proven and developed rich oilfields of Mukta and Panna at what amounts to not even a throwaway price, since Enron and its Indian partner are saved the entire burden and cost of exploration and discovery, and even of development of the oilfields. The argument that the continued running and exploitation of these oilfields would not have been possible without the entry of foreign private parties is totally specious since the large profits of the ONGC as well as the high value of its owned assets would have made it easy for the ONGC to raise the capital required for this through borrowing. It was actually prevented from doing this and instead this complicated and adverse arrangement was arrived at. Since the oil sector is one of the most profitable in the world even after absorbing the very large costs of exploration and development, the profitability of this venture without such costs can be easily imagined. Yet the simple provision of readymade profits in already developed oilfields was surely not the purpose of inviting foreign investment into the oil sector. Rather, the argument has been that the Indian government simply does not have the funds for the massive investments required for exploration and development. If the more difficult and expensive part of the process still has to be financed by Indian tax-payers, only to be transferred to (primarily) foreign hands once the profitability is evident, then the process does not represent the success of the new economic strategy so much as a public fraud of gigantic proportions.

A scam on nearly a similar scale is evident in the attempted sale of a mine in Bailadilla in Madhya Pradesh which is currently creating much controversy. This time the natural resource concerned is iron ore, and the public sector undertaking involved is the National Mineral Development Corporation (NMDC). The pattern is very similar: once again, a joint venture is sought to be set up in which the NMDC will be a minority shareholder, with 89 per cent of the shares being held by Nippon Denro Ispat (NDIL) in which the Mittal group holds the controlling share. The only significant difference is that this time the private beneficiaries are predominantly Indian, with the foreign (Japanese) participant holding a minority share. The mine in question is No 11B, one of the most profitable iron ore mines of the NMDC, with more than two-thirds ferrous content. The mines were discovered after 12 years' exploration work by the NMDC and, cumulated over the last two decades, have already fetched a net profit of Rs 1,764 crore. However, the deal envisages handing over the facility to the new company for only Rs 16 crore, to become a captive mine of the NDIL steel unit.

This is clearly a settlement which is against the interests of the NMDC, which has been prevented from either using its own earned profits or raising resources through other means to finance expansion and which has had to part with one of its most productive mines for a pittance. It also indicates the strength of the current discrimination against the public sector steel units which have been denied the advantage of possessing this as a captive mine. At least one steel PSU, the Visakhapatnam steel plant, had expressed interest in acquiring Bailadilla mine No 11B without getting any positive response from the steel ministry. Instead, the ministry's choice was finally a secretive and untendered deal with a private party on terms which are more than generous to the private contractor and costly for the public sector units involved. There has been widespread criticism of this agreement, not only by the NMDC management and labour unions, but also by the Madhya Pradesh government as well as other independent observers and in parliament. These criticisms – which have held up the finalisation of the agreement thus far – have mainly concentrated on the closed and surreptitious nature of the deal which therefore carries with it a strong whiff of likely corruption, pay-offs and similar influences with which Indian citizens are now only too familiar. While these factors may well be operative, the close similarities of this with the ONGC settlement with Enron/Reliance suggest that there is a pattern to these agreements which transcends the immediate kickbacks accruing to individuals or groups.

This suspicion is confirmed by the recent proliferation of similar contracts that are being negotiated between various public sector units and state governments on the one hand and private (often foreign) parties on the other, specifically with reference to extractive industries. These may not be as extreme as the deals discussed above in terms of the highly skewed nature of the contracts and the loss to public units, but they reflect the same broad approach to the appropriation of natural resources previously controlled by public undertakings. Thus the Orissa Mining Corporation (OMC) has signed a memorandum of understanding with the private sector Mesco group, which plans to build a steel plant in Orissa, to set up a joint venture company (once again with minority public sector shareholding) to mine iron ore. This involves handing over five small iron ore deposits, all of which have already been explored and some of which have been developed by OMC. While the mines concerned are smaller in size and slightly lower in ferrous content than the Bailadilla mine No 11B, their transfer is part of the same broad process of handing over established mineral resources, whose very presence has been discovered by expending

NEW BOOK FROM **MD** PUBLISHERS OF THE HUMANITIES NATURAL & SOCIAL SCIENCE

RUSSIA'S POLICY TOWARDS INDIA

FROM STALIN TO YELTSIN

By

J A Naik

1995, 219p, bibliography, index; 22x14 cm

ISBN 81-85880-79-4 Rs.300 00

This book covers Russia's Policy towards India before and after the disintegration of Soviet Union and also how Yeltsin had settled the question of the huge loan to India on highly unfavourable terms. It also examines the socio-economic viability of the Soviet Union's new States.

public funds to private agents who have thereby been saved from incurring outlays on exploration and development.

The controversial proposal to hand over degraded forest lands to the pulp and paper industry for plantations, which has been cleared by the environment ministry but has yet to get through the cabinet, is slightly different from these other deals, but is still part of the broad approach of privatising available natural resources. This proposal envisages that the state-level forest development corporations would enter into a memorandum of understanding with certain private pulp and paper companies, in which forest land in units of at least 100 hectares would be leased out for 30 years at first and possibly for another 30 years later. The official excuse, as usual, is that budgetary constraints have meant that afforestation and forest regeneration schemes have had to be curtailed so that the 'only option' is that of allowing private contractors to take over. It has been argued that this would prevent the encroachment of forests as well as enable private industry to meet its raw material requirements easily. However, the scheme has been criticised because this amounts to subsidising private industry and handing over important land areas to the companies, even as it squeezes small farmers and reduces the access to these lands of the local communities who depend for livelihood or some part of subsistence upon fuelwood and minor forest produce. It would also jeopardise those farm forestry programmes under which farmers are encouraged to produce wood for industry in a sustainable manner by planting trees between their crops. In effect, this scheme violates the government's own National Forest Policy of 1988, but it still has some chance of being pressed through by this regime.

What is the rationale behind this very broad sweep of government policies directed towards privatising publicly-held natural resources? While graft and kickbacks accruing to those in control may be important elements in explaining the details of individual deals, they can explain at best only a part of the general pattern. Nor can fiscal difficulties be upheld as the genuine cause of this spate of resource privatisation, since in most cases these resources are being transferred to private hands at effective prices well below their real valuation, and imply losses of potential revenue from these assets as well. What seems to matter is the government's acceptance of a policy regime that makes the 'fiscal retreat' of the state and foreign and domestic private investment the central features of its growth strategy. The widely publicised belief that public sector enterprises simply cannot manage natural resources efficiently or make the best and most cost-effective use of them is one element of such a regime that legitimises privatisation as an end in itself. So is the view, assiduously nutured by the government, that winning the 'confidence' of the private foreign investor and ensuring thereby the inflow of large volumes of private foreign capital is a sure route to successful development and therefore an indicator of economic success itself. These 'beliefs' imply the dismissal without thought of the argument that the inadequacies of public sector units managing natural resources can in most cases be attributed to the fact that they have been starved of investment funds by the government and have actually been prevented (by the ministries concerned) from undertaking expansion plans with their internal resources or by raising funds in capital markets.

This tendency to dismiss alternative perspectives by the government has been heightened in practice by the failure thus far of two of the critical planks of the present government's programme of 'economic reform': privatisation and the need to attract foreign investment. The privatisation programme of the government has over the years 1991-92 to 1994-95 yielded receipts estimated at Rs 10,188 crore or an annual average of Rs 2,547 crore. Compared with the net increase in its internal debt of well above Rs 20,000 crore in 1993-94 and 1994-95, this is an extremely small sum. Thus privatisation as a proclaimed means of reforming the fiscal regime has hardly been successful. Not surprisingly, the government has chosen to raise the budgeted receipts from privatisation to Rs 7,000 crore in 1995-96. However, with the stock markets witnessing a prolonged period of slack there is little hope of this year's privatisation taking off. Overall, there have been three problems faced by the privatisation exercise. First, it has proved impossible to divest shares in the poorly performing public sector corporations, and an initial effort at clubbing such shares with those of profit-making companies discounted the price of the latter to a degree where the press was flooded with stories of a virtual scam in the sale of public assets. Second, even in the case of relatively successful companies the government has on occasion not been able to obtain bids that match the reserved price that it has set for sale of shares of such companies. And finally, precisely at a time when an unsustainable increase in its borrowing requirements forced the government to expand the scale of its privatisation programme, the market has turned lukewarm in terms of both the price it is willing to offer and the volume it is willing to take.

The sense of 'failure' generated by this tendency has been aggravated by the experience with the other main plank of the government's 'reform' programme: namely, the drive to attract foreign capital into the country. This has been seen as necessary to fill numerous gaps which constrain economic growth: the saving gap, which would be met by the inflow of foreign saving; the foreign exchange gap, which would disappear because of the money brought in by foreign investors; and the technology gap, because foreign investors will bring in international front-of-the-line technology in critical areas of production. In all of these areas, and particularly the last, the FDI inflows have been woefully short of expectations. The inflows that have had a substantial impact on the balance of payments have been those of portfolio capital which is now widely accepted as less stable and less desirable from the standpoints of economic growth and sustainability. By contrast, the total actual FDI inflow in the four years from August 1991 to May 1995 amounted to a paltry Rs 8,646 crore. While FDI approvals (as opposed to actuals) have increased substantially over the past few years, even these are not all that large in relation to either domestic saving and investment or the overall capital account of the balance of payments. Thus, excluding the issue of global depository receipts by Indian companies abroad, FDI proposals approved in 1994 totalled only Rs 8,890 crore, marginally above the 1993 figure of Rs 8,860 crore. Even these are mainly in areas which have not been considered priority areas for foreign investment insofar as the provision of newer and more sophisticated technologies is concerned, and very little of it has been in longer term investments which involve large outlays of capital. Thus, in the past four years, only Rs 386 crore worth of FDI proposals have been approved in the oil and hydrocarbon sector — and this amount includes the Enron/Reliance deal over the Mukta and Panna oilfields.

The failure of the government to push through its strategy of privatisation on the one hand and attracting foreign investment on the other has had two major consequences. First, since these were expected to contribute to a reduction in the government's fiscal deficit and to induce a degree of buoyancy in the level of private investment, their inadequate realisation contributes to shortfalls relative to explicit or implicit fiscal and investment targets set as part of the 'new' economic programme of the government. Second, since they are the principal planks of the reform programme, their 'failure' begins to question the viability of the liberalisation process itself. Unfortunately, given the interests at work the world over, such failure never results in a reconsideration of liberalisation, but in the argument that the process has not gone far enough. It is perhaps partly because of this perception that the government finds the need to put on sale natural resource based-assets at prices that no potential buyer, domestic or foreign, can refuse. What matters is not whether the exercise contributes to the objectives, such as resource mobilisation or rising private investment, that it set out serve. What is at stake is the credibility of the instruments the government has chosen for achieving its goals. In such circumstances it is not the end result which matters, but the pursuit of a strategy, whatever be the cost. That in the process the primitive accumulation drive of powerful interests is also served, converting social costs into private benefits, only whets the appetite of those who handle these instruments.

COMMENTARY

Post-Militancy Scenario in Kashmir

Balraj Puri

There is a school of thought in India which will welcome it if the Pakistan-based militants in Kashmir continue their operations, for then the military aspect of the Kashmir problem will completely overshadow the political and moral aspects. The weakening of the Kashmir-based militant movement is encouraging this school to argue against any political measures to reduce the alienation of the people and in favour of further repression to force the people into total surrender. But the dividing line between demoralisation and desperation is a thin one and will it be in the interests of India to push the Kashmiri people over it?

IF the situation in Kashmir is to be measured in terms of casualties of the militants, over 600 killings in the last two months should confirm the official claims about the improvement there. However, elimination of militants does not always lead to elimination of militancy. Nor is the end of militancy synonymous with the end of alienation.

As long as depletion of the ranks of the militancy is replenished by fresh recruits, locally or from outside, the situation would hardly improve. Similarly some non-militant forms of expression of alienation can be more unmanageable and embarrassing than even militancy. The crucial question is how the vacuum created by decline of militancy is filled.

Militancy itself is a consequence of the vacuum created by the collapse of politics in Kashmir. The games that New Delhi played from 1984 to 1986, including dismissal of a duly elected government of Farooq Abdullah and his reinstallation after he agreed to share power with the ruling party at the centre, did succeed in undermining the Kashmiri identity and the prestige of its then leader. The vacuum was filled by the emergence of the Muslim United Front (MUF). But when the MUF, too, was not allowed a fair chance in the battle of the ballot in 1987, it created an appeal for the method of the bullet.

The JKLF which pioneered the militancy in the valley seized the opportunity to occupy the space vacated by Kashmiri nationalists and democratic politics. But within two years, the state government claimed that the JKLF had been wiped out. The vacuum did not last long. For meanwhile Pakistan too shifted its support – in terms of supply of arms and training – to alternative outfits like Hizbul Mujahideen. For the last one year, the Hizb has borne the brunt of the operations of the security forces and suffered heavy losses.

During this period the disillusionment of the people with Pakistan also grew for a number of reasons. Shift in Pakistan's support from pro-independence to pro-Pak groups and its exclusive reliance on Jamat-e-Islami, which disapproved of many of the religious beliefs and practices of Kashmiri Muslims, and killing of leaders like Qazi Nisar and some ideologues of Kashmiriyat, allegedly by a pro-Pak outfit created a backlash of Kashmiri nationalism. As alienation with India had not declined meanwhile, nor were any measures taken to assuage the hurt feelings of Kashmiriyat, the clashing forces of Kashmiriyat and Islamic solidarity remained within the broad secessionist umbrella.

Aside from the efforts that Pakistani agencies might have made to resolve differences between the two factions, the government of India too contributed to imposing unity on them. The decision to hold elections in the state, without any understanding or dialogue with any dissident group, was regarded as a move to thrust the traditional leadership on the state as has been the past practice. Despite their internal differences all the militant groups and their overground leaders united in giving a call for the boycott of the polls. The postponement of the proposed polls gave an impetus to their morale and unity.

The way Chrar-e-Sharief crisis was handled by the Indian government has a far greater unifying impact on the secessionist groups. As nobody in Kashmir believed in the official version about the responsibility for the tragic incident of burning of the most sacred shrine of the valley, the degree of alienation also increased. Thus whatever might have been gained in anti-militancy operations was lost on the political and psychological front.

It was under these circumstances that the JKLF had to rejoin the Hurriyat which added to the latter's respectability and representative character. As Jamat-e-Islami joined in popular protest against the burning of the shrine, its reservations about the sanctity of Sufi shrines was condoned by votaries of Kashmiri Islam. Though it still stands for Kashmir's accession to Pakistan, it has agreed to abide by the verdict of the people. Hurriyat also withdrew its condemnation of the use of Gandhian methods like fasts adopted by the JKLF chief Yasin Malik.

The dividing line between Kashmiriyat and fundamentalists has thus been blurred. But a line has now been drawn between Kashmir-based and Pak-based groups mostly comprising non-Kashmiris. The latter include Harkatul Nisar, Lashkar Toeba and Al Farhan. Hurriyat leaders disapproved of the ban by the Harkat on the Amarnath yatra and the series of bomb blasts in Jammu which it owned. They also condemned the kidnapping of the five foreign tourists by the Al Farhan and organised a successful bandh to protest against the killing of the Norwegian hostage.

How sharp is this divide and how long it will last will depend on the capacity of the Hurriyat to withstand the pressure from both the sides – India and Pakistan – and to provide effective leadership to the people and the militants in the valley. Already Pakistan agencies are maintaining varying degrees of influence on and contacts with its constituents. The division of the secessionist camp may be partly under a tactical understanding.

The Kashmir-based militants are equally handicapped in facing the Indian offensive. The security forces have established a clear edge over them. The supply of local recruits is dwindling. The yearning for peace among the people is also growing. Are Kashmiri leaders in a position to articulate the popular mood and agree to initiate a dialogue with the non-Kashmiri Muslim communities of the state and the government of India to explore possibilities of an honourable settlement which may eventually involve Pakistan? Or will they allow Pak-based militants to continue their war on their own volition on account of lack of response.

There is a school of thought in India which will welcome the latter prospect. For the military aspect of the problem will then completely overshadow the political and moral aspects which it believes suits India. In fact the weakening of the local militant movement in the valley is encouraging this school to argue against any political measures to reduce the alienation of the people and in favour of further repression to force the people into total surrender. But there is a very thin line between demoralisation and desperation. Is it really in the enlightened self-interest of India to push people to the latter course?

The cost of subjugating an alienated, humiliated and fanaticised people will become increasingly prohibitive. It will undermine the moral, secular and democratic basis of the Indian nation apart from the economic costs and diplomatic humiliation.

The stakes for Kashmir are even more serious. For as the ground between Indian security forces and the foreign militants shrinks, there will be no room left for its identity and dignity. More Kashmiri blood will be shed and more Kashmiri lives will be endangered. The choice for the people may eventually be reduced to be ruled either by, say, a Mast Gul or a stooge of Delhi.

This scenario is not inevitable provided those who matter in New Delhi and Srinagar are conscious of their own enlightened self-interest and knowhow to assert it.

India: Economic Outlook, 1995-97

In an overall assessment of the economic situation, the continued tempo of industrial recovery, despite the prospects of a slow-down, is a matter of satisfaction. However, persistence of inflation for this and the next year and widening fiscal and trade gaps are matters of concern.

I
An Overview

SURPRISES in the economic sphere have, by and large, been conspicuous by their absence during the last six months. For the year ending March 31, 1995 our current estimate of the growth of real GDP (at factor costs) is about 5.8 per cent. The rate of inflation based on the wholesale price index (52 weeks average) has actually turned out to be about 10.8 per cent. Merchandise exports in US dollars appear to have increased by nearly 20 per cent over the preceding year whereas the growth of imports in dollars has been of the order of about 22 per cent. Trade balance appears to have widened from about US dollars 1.2 billion in 1993-94 to about US dollars 2.1 billion in 1994-95. The current account deficit has also correspondingly widened. However, since the foreign currency assets currently stand at a comfortable level of about US dollars 19 billion, this widening current account deficit poses no immediate problem. As more recent, revised and firm information comes in, our prognosis of the state of the economy made in March 1995 is getting confirmed, more or less, in all its dimensions (*Economic and Political Weekly*, March 25, 1995). Thus, our overall view of cautious optimism remains valid not only for 1994-95, but also for the current fiscal year, 1995-96.

For this year, 1995-96, our forecast for real GDP growth stands at 5.7 per cent with a strong possibility of the rate exceeding the 6 per cent mark during the next year (1996-97). While real fixed capital formation is likely to rise by a little over 8 per cent in both the years, the growth rate of total capital formation would be about one percentage point higher. The rate of inflation is likely to be about 9 per cent this year and a percentage point lower next year. Fears of higher inflation during the current year are looming large due to populist expenditures launched in view of the forthcoming general elections to parliament. During 1995-96, the dollar value of exports is likely to grow by nearly 17 per cent and next year, by about 15 per cent. This is going to be accompanied by increase in the merchandise import in dollars by about 25 per cent in 1995-96 and by about 19 per cent in 1996-97. These imply a trade gap of the order of about 5 and 7 billion dollars in the years 1995-96 and 1996-97 respectively. The current account deficit will correspondingly be of the order of about $3 billion in 1995-96 and a bit less than $5 billion in 1996-97.

II
Output and Prices

The tempo of growth has been considerably strengthened by continued good conditions in the agricultural sector due to the eighth successive favourable south-west monsoon. Fears of a poor monsoon at the start of the year have now turned out to be false. Rains, though delayed, have turned out to be normal or even better in terms of coverage of different parts of the country. The traditionally drought prone regions of Rajasthan and southern Andhra Pradesh (Rayalseema) have received more than their normal rains. While Orissa and Maharashtra were deficit till August end, these regions too have now had more rains and perhaps reached their normal levels. Our forecast assumes just normal rainfall giving a growth rate of 2.1 per cent for 1995-96 as compared to 2.4 per cent in 1994-95 and 2.8 per cent in 1993-94. If the south-east monsoon in October-November also turns out to be as good, agricultural sector may grow at a higher rate pushing the overall GDP growth rate to a level slightly higher than that predicted. For 1996-97, growth rate of the agricultural GDP is projected to be about 2.7 per cent, if rainfall is normal.

Growth in the industrial sector is subject to substantial improvement in the performance of the infrastructure sector. Infrastructure sector is poised to grow at about 5.5 and 6 per cent in the current and next year respectively. This may not be able to sustain a high tempo of growth in manufacturing. Though public sector investment is, in general, unlikely to increase by more than 2 or 3 per cent in real terms due to continued high inflation, real private sector investment is expected to grow by about 7 or 8 per cent. This implies that real fixed capital formation grows by over 8 per cent in 1995-96 and 1996-97 compared to about 5 and less than 8 per cent in 1993-94 and 1994-95. Total real capital formation is poised to grow by over 9 per cent per annum. Under the circumstances, manu-facturing GDP is expected to grow by over 8 per cent for 1995-96 and 1996-97, a rate somewhat slower than that (9 per cent) in 1994-95, a year of substantial revival from a lower base in 1993-94.

With a satisfactory performance in agriculture and industry, the demand for economic services is likely to keep in step. Consequently our forecast is that this sector will grow by 7 to 8 per cent during the current (1995-96) and the next (1996-97) year which is in alignment with the performance of this sector in 1994-95. This year (1995-96) being the election year, expenditure on public administration and defence, including that on social services under various schemes will result in increased level of activity under this sector. The rate of growth of GDP in public administration and defence is thus likely to exceed 6 per cent for the current year. For 1996-97 the growth rate is predicted to be just 6 per cent.

One issue which has been rightly worrying policy-makers, especially those in the Planning Commission, as well as economists in the country, is the decline in the rate of saving. The poor state of public finances in the states as well as at the centre adds to this problem. This is particularly important as regards availability of resources for investment in social and economic infrastructure. In the wake of the Enron affair, setback with regard to inflow of foreign direct investment, particularly in infrastructure, appears to be quite likely though this may be only a temporary phenomenon. In the absence of adequate capital formation in the infrastructure sector, bottlenecks will quickly emerge, as they already have, with improvement in capacity utilisation. This is bound to affect adversely not only industrial growth but also exports.

The fact that elections for the parliament are now no more than six months away does take its own toll. In his independence day speech, the prime minister has already committed about Rs.40 billion for various schemes for the poor, leaving little resources for investment in the public sector besides throwing public finances, in general, out of gear. During the first five months of this financial year, the net RBI credit to the central government has risen nearly by Rs. 160 billion compared to a much smaller figure for the corresponding period last year. Despite this restraint last year, money supply (M_3) rose by an unprecedented rate of over 21 per cent largely due to foreign inflows. There are thus indication that our assumption that M_3 will grow only at about 18 per cent in 1995-96 and at a still lower rate of 17 per cent in 1996-97 may turn to be optimistic. Obviously, if the trend of the recent months

[Note prepared by Institute of Economic Growth (IEG) and Delhi School of Economics (DSE) Research Team on Macromodelling of the Indian Economy for Fall Meeting of Project LINK, University of Pretoria, South Africa, September 25-29, 1995].

continues, monetary expansion will be much higher and hope of even a gradual deceleration in inflation could be belied.
